On 25 August 1943 supply duties on the south coast passed to the control of the 6625th Base Area Group (Provisional). At the same time Army service troops in that area were detached from the 1st Engineer Special Brigade and either attached or placed in direct support of the Base Area Group. On the 4th of September supply activities centering on Palermo were also taken over by the Base Area Group. Necessary Army service troops were attached to or placed in direct support of the Base Area Group. Thus by the 4th of September all supply and transportation in the Seventh Army Area was centralized under the direction of the Base Area Group.

SCALE OF SHIPPING

Navy transports and craft used in the assault comprised the following:

CENT FORCE (45th Div)	DIME FORCE (1st Inf Div)	JOSS FORCE (3d Inf Div)	KOOL FORCE (2nd Armd Div)
1 Hq Ship	1 Hq Ship	2 LSI(S)	2 Troop Ships
7 APA	3 APA	37 LST	7 MT/Store Ships
6 XAPA	3 XAPA	70 LCT	5 LST
5 AKA	2 AKA	52 LCI(L)	7 LCT
13 LST	2 LSI(S)		22 LCI(L)
8 LCT	25 LST		
5 LCI(L)	19 LCI(L)		

A general breakdown of troops, vehicles and supplies carried on these ships is shown in Appendix "B".

Shipping to bring in the build-up of troops and vehicles came from two sources:

(1) Navy craft which established a shuttle service between Tunis-Bizerte and Sicily. Details of sailings of craft are shown in Appendix "C".

(2) Additional shipping set up and scheduled to arrive as follows:

	CENT	DIME	JOSS
D+1	7 MT/Store ships 2 Coasters	4 Troop Ships 10 MT/ Store Ships	4 Coasters
D+8	2 Coasters	7 MT/Store Ships 1 Tanker	5 Coasters
D+14	2 Coasters		4 Coasters

D+28 Remainder of 9th Division in 5 troop ships and 7 MT/Store ships, all to be found from shipping used in previous convoys. Actually the 9th Division disembarked at Palermo during the seven days 1 August to 6 August.

With this shipping set up it was expected that by D+14 there would be a week's supply landed on the island. Continued maintenance relied upon ships arriving from the United States in regular UGS Convoys at the following rate:

Convoy	Date Available	No. Ships	Tonnage
UGS-11	19 July	14	90,831
UGS-12	3 Aug.	12	73,199
UGS-13	19 Aug.	16	96,244
UGS-14	29 Aug.	10	56,963
UGS-15	8 Sept.	5	30,000
	Total	57	347,237

These ships were to be held in North Africa until called forward at the rate at which they could be accepted. The actual rate of acceptance of these maintenance ships was:

Convoy	Date Accepted	Port	No. Ships	Tonnage
UGS-11	26 July	South Coast	5	33,128
UGS-11	6 Aug.	South Coast	2	12,687
UGS-11	7 Aug.	Palermo	7	45,016
UGS-11	10 Aug.	South Coast	3	18,838
UGS-12	10 Aug.	Palermo	3	18,068
UGS-12	23 Aug.	Palermo	6	36,293
UGS-13	28 Aug.	Palermo	7	41,496
UGS-13	3 Sept.	Palermo	1	9,378
UGS-13	8 Sept.	Palermo	3	17,220
UGS-14	8 Sept.	Palermo	6	23,411
UGS-15	8 Sept.	Palermo	11	29,400
		Total	11	252,535

A comparison of the tonnage bid by the services to be delivered from the States by 8 September (347,237) with the tonnage actually received (252,535) reveals that actual accomplishment was 94,702 tons short of what was considered necessary.

Combat loaded ships and craft and all ships of convoys to include the D+8 Convoy were equipped before sailing with the essential stevedore gear necessary to discharge their cargoes. All gear was top loaded and precautions taken to ensure its availability. It was anticipated that the tactical situation might permit discharge of some of these ships, in particular the coasters, at newly established ports or beaches and that therefore all ships should have aboard such stevedore gear. Upon completion of discharge of any ship or craft, stevedore equipment was recovered and taken ashore for future use in the ports. Further, in anticipation of working four ports in the Seventh Army Area, detailed requisitions for port equipment were prepared and submitted to SOS, NATOUSA, for delivery in the first ships to arrive from the United States. Much of this equipment, particularly cranes, barges and trailers, did not arrive as scheduled. Particular attention was paid to the fact that the initial landing would be an amphibious operation relying chiefly on DUKWs and LCTs to discharge vessels lying at anchor off the beaches. Six cargo nets 12'x12' were provided for each DUKW. To further fulfill expected needs and to expedite discharge of the combat loaders, ammunition and rations were block stowed on all vessels of the assault convoy making it feasible to unload any one item as needed.

ENGINEER SHORE REGIMENTS

Engineer Shore Regiment performed their function as a Force SOS in admirable fashion. This decentralized method of operation in the initial stages wherein the Shore Regiment is placed under the direct control of the division proved to be their greatest handicap. It is recommended that these regiments be placed in support of the divisions. Control of their operations is an Army function and should not be delegated to lower echelons.

NAVY

Unloading operations depended largely upon the use of Navy craft. Control of these craft remained with the Naval officer afloat, with the result that it was extremely difficult to locate the craft and to utilize them to the best advantage. Similarly the Naval officer afloat controlled the movements of ships lying off the beaches and discharging. It is thought that better control and a closer identity of purpose between the Army and Navy would have been achieved had the control of the movements of ships and craft been vested in a Naval officer established ashore with the Army personnel in charge of unloading.

In unloading operations the LCT proved to be the most adaptable and most efficient craft for lighterage purposes. The fact that it was originally conceived as an assault craft should not preclude its use for strictly cargo handling purposes. To that end, specific allocation of craft to be used for this purpose alone should be made in advance, and arrangements made for basing them on shore.

RAILROADS

Railroads were taken over and operated directly in support of the advance of the Army. Operation was under the direction of the 727th Railway Operating Battalion. A complete report of operations by this battalion is attached as Appendix "E".

HIGHWAYS

Highway operations were divided into two sectors; the south sector was operated by the 1st Engineer Special Brigade, the north sector by Seventh Army. However, Army coordinated all movements in both areas. Further detailed operation as noted in Appendix "G".

PETROLEUM

Construction and operation of pipelines and bulk storage installations for white fuels was by the Engineers. Requirements for such facilities and scheduling of tankers were determined by the Transportation Division. Appendix "F" outlines fully the planning, operations and operational statistics.

COMMUNICATIONS

Throughout the operation there was a general lack of communications, due mainly to the rapidity of advance and the changing of headquarters. Lack of railway communications prevented dispatching more than one train on a line until verification of the fact that the train had reached its destination. Highway traffic control was difficult due to the great distances and lack of communications.

RECOMMENDATIONS

1. In amphibious operations, control of all unloading operations should be in one headquarters on land. This headquarters should be manned jointly by the Army and Navy with full power to control ships and dispatch craft.

2. Bids by the several services for supplies should be scrutinized with a view to determining what can reasonably be expected to be discharged in the time required with the facilities available.

3. Consideration should be given to the establishment of communications which will serve supply channels. A definite allocation of communications separate from those demanded for tactical purposes should be made and provision made to guarantee fulfillment.

4. Before the start of operations, Army service units deemed necessary should be placed in support of the landing forces. Control of these units should remain with the Army to ensure that they are brought in at the desired time and are employed as originally intended.

APPENDICES TO HISTORY OF THE TRANSPORTATION DIVISION

APPENDIX "E"

RAILROAD OPERATION IN SEVENTH ARMY SECTOR OF SICILY

The first detachment of the 727th Railway Operating Battalion arrived at Licata as follows: July 12, three officers and eighteen enlisted men; July 15, four officers and forty-one enlisted men. The remainder of the battalion arrived on July 22 and July 26. The first train departed Licata 1130, 12 July 1943, for the purpose of inspecting and repairing the track between Licata and Campobello. The track was broken in several places. Repairs were made the same day.

13 July 1943 a train was operated to Falconara. The track was broken in three points. Twenty-eight empties were placed for loading at Falconara, afternoon of 13 July 1943, of which thirteen were loaded and moved to Campobello. Thus, the first service was established.

COMMUNICATIONS

Signal Supervisor, with three enlisted men of the Signal Section arrived with the second echelon, first detachment at 1630, 15 July. Signal Corps was contacted for dispatcher's circuit Licata to Campobello. Negotiations with Signal Corps were subsequently continued for extension of dispatcher's circuit, as track mileage operated was increased. The remainder of the small signal section arrived 24 July.

From Palermo east to Cefalu the signal communications were established by using civilian signalmen, under the protection of American soldiers. A Signal Corps circuit was used from Cefalu to San Stefano and was connected into the stations by Italian civilians. The telephone lines from Palermo, west to Trapani and from Alcamo to Castelvetrano were rebuilt by Italian civilians and a representative from the Signal Corps.

The Signal Section proceeded to recondition circuits as soon as circuit assignments were made. Telephone service was provided closely following the extension of railheads and in some cases service was provided ahead of train service.

The communication problem was complicated by the almost entire lack of interurban telephone circuits, other than railway circuits. First priorities on wire facilities were allocated for Army tactical and operational circuits, and in some cases Air Corps service. Wires were found badly damaged by bombs and combat fire and cut up by combat units providing front line tactical communication.

The line wire was patched up wherever possible. Large quantities of field wire laid to bridge the longer sections of wire damage.

The transmission losses in these sections of line made it impossible to establish through dispatching circuits over the entire line operated. The operation had to be sectionalized. Station to station manual block was established for train movements.

Considerable difficulty was experienced in maintaining continuous communication due to the following factors:

Line wire breaks due to traffic, small arms fire, and nicks in line wires due to previous combat.

Signal Corps rearrangements of circuits.

Long sections of field wire being cut out of dispatcher's circuits by saboteurs.

Sabotage, including numerous cases of fine wire being wrapped around all circuits on the line.

The lack of roads paralleling the railway made the use of track motor cars imperative for line repairs as the line could not be reached with road transportation.

TRACK

Track and bridges were repaired between Campobello and Canicatti by Maintenance of Way Company. Canicatti established railhead 18 July 1943. Tracks were heavily damaged at Campobello, Canicatti, St. Cataldo, Caltanissetta, Xirbi, Imera, Enna and Dittaino. Some damage to tracks at all other stations.

The first tunnel west of Enna was found caved in about the middle of the tunnel. This was cleared by hand and cribbed up.

Overhead bridge east of Pirato was found with six concrete posts demolished. Timbers were used to make temporary repairs. An eight foot fill, a highway diversion across the track at this point was removed. Track opened to Dittaino 4 August. Repairs made to seven tracks at that point. This station available for use as railhead 7 August. By 13 August all damaged track including yard tracks within the Southern Section of the Inland had been repaired and placed in service. Work started 23 August 1943 to open the railway for operation east of Dittaino. Inspection of track Licata to Dittaino, and Port Empedocle to Canicatti made 18, 19 and 20 August 1943, indicated track in good condition, except in need of surfacing between Xirbi and Imera and between Licata and St. Elmva.

The tracks from Palermo to Cefalu were opened with the help of Italian railroad workers. The Corps of Engineers constructed three bridges between Cefalu and San Stefano and men from the Maintenance Company of this organization, cleared and repaired the breaks in the track.

Near Isola Del Femine a tunnel approximately 800 feet long was badly damaged by demolitions. This tunnel was reopened by using Italian railroad workers. Many of the stations west of Palermo contained bombed and burned railroad equipment. Tracks were cleared and put in service by soldiers of the Maintenance of Way Company.

The line between Dittaino and Garbini was turned over to the Americans by the British 23 August 1943. Two bridges and thirty breaks in the railroad were repaired and the line opened 28 August 1943.

WATER

From the outset, operation of trains were delayed account inadequate water supply. Supply lines and installations were damaged at all water stations. It was necessary to supplement the regular water supply at Xirbi, Villarosa, Pirato and Port Empedocle by finding new water sources as demands were made upon the railway for movement of increased tonnage. Some trains were given water from five gallon water cans. Water cars and water trucks were pressed into service. It is estimated that 5% of the tonnage handled was water for the locomotives.

In the Southern Section no boilers of locomotives were washed until 12 August account insufficient water. By 12 August an adequate supply had been developed and all installations in service. Regular boiler washing program was set up at this time.

Outstanding service rendered by the water service section of the Maintenance of Way Company in repairing and maintaining water supply lines and installations. Excellent work was also done towards developing new sources of water.

LOCOMOTIVES

From 13 to 26 July, five road and one yard locomotives were available for service. During the period 26 July to 13 August an additional thirty-seven locomotives were repaired and placed in service. Of these, twenty-three were at outlying points. Many of these locomotives had been machine-gunned, robbed of machinery, parts, etc.

In the Northern Section, sufficient locomotives, in usable condition were found and placed in service. In the Northern Section there are a total of 137 locomotives, of which 72 were serviceable.

In the Southern Section there are a total of seventy-three locomotives, of which fifty-five locomotives were serviceable.

FLOW CHART OF RAILROAD SHIPMENT TONNAGES

EQUIPMENT

In the initial operation between Falconara and Campobello there were approximately one hundred cars of the various classes available for service. There are about 2,800 serviceable freight cars divided approximately as follows:

1610 - Box
1140 - High Gondolas
395 - Low Gondolas
60 - Flat Cars
70 - Tank Cars (Gas)
80 - Refrigerators
45 - Water Cars

90% of these cars are in good condition, many of them new and they will require a minimum of maintenance. There are approximately 500 freight cars which had been bombed or burned.

FUEL

In the initial operation between Falconara and Campobello, one hundred tons of coal was available at Licata. Reconnaissance of the railway showed the following coal available:

250 tons - Port Empedocle
100 tons - Licata
200 tons - Aragona Caldare
250 tons - Caltanissetta
400 tons - Xirbi
1,000 tons - Palermo
800 tons - Alcamo
200 tons - Castelvetrano

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

SECRET

The coal situation at both Licata and Palermo became critical, but in both places sufficient coal was secured to continue operations. At Licata coal was secured from the Navy. 3,000 tons of coal was unloaded at Licata, part of which will be shipped to Palermo. This was sufficient coal for three weeks operation.

STRUCTURES

At almost every station, the yard, tracks and buildings had been damaged. The worst damage had been caused by air raids, but considerable damage had been done by the retreating Italians, and looting by the civilians. Stations at Canicatti, Caltanissetta and Alcamo were the most severely damaged. In many of the stations the telephone and telegraph instruments had been either removed or damaged beyond repair. Tracks were rebuilt and the debris cleared away by members of this organization, Italian civilians and prisoners.

SUPPLY

In the Southern section only a small amount of supplies were found. There was practically no oil or grease and a few other critical items of this nature. There was only a small supply of locomotive repair parts. At Palermo a well equipped storehouse was found and with the exception of a few critical items, sufficient material is on hand for maintenance of the locomotives for six months. The critical items were: locomotive lubricants, repair parts for air pumps and diesel motors and belting for machines.

NARROW GAUGE

The narrow gauge railroad from Licata to Margonia was opened and a few supply trains operated. After 20 July, there was no further need for the line and operation was stopped.

TROOPS MOVED 7316

PRISONERS MOVED 1985

In addition to the above, 610 carloads of empty drums, salvage, signal and engineer equipment were handled.

A hospital train of 12 cars was operated daily from Cefalu or San Stefano from August 1 to August 25, and handled a total of 3775 casualties.

On the 1st of August civilian passenger train service was inaugurated for workers in the Palermo district. Regular schedules were established on the lines east and west of Palermo and on the narrow gauge south from Palermo.

OPERATIONS

Operation of trains depended upon the opening of track and availability of water. The following figures cover the number of trains operated, cars and net tons handled for the period 13 July to 23 August inclusive:

FIRST DISTRICT: East of LICATA

SECOND DISTRICT: North of LICATA

THIRD DISTRICT: PORT EMPEDOCLE to CANICATTI

FOURTH DISTRICT: PALERMO East

FIFTH DISTRICT: PALERMO West

SIXTH DISTRICT: PALERMO South

FIRST DISTRICT

NOTE: A train operated from Licata through to Pirato is counted as two trains account split at Caltanissetta.

On account of the heavy grade in this area practically all trains were operated with two engines and in many cases East of Caltanissetta three engines were used per train.

RECOMMENDATIONS

1. It is recommended that a Signal construction company be assigned to the railway operating battalion during the initial states of an invasion.

Dependable communications are absolutely essential to railroad operation. The signal section of an operating battalion has only twelve men, which is entirely inadequate for extensive reconstruction. The Signal Corps is of necessity more interested in tactical circuits, which leaves no personnel to construct a circuit for the railroad.

2. It is recommended that the administrative control of a railway operating battalion be kept under the command of one officer, reporting to one headquarters, regardless of the different areas in which the battalion may be operating. It is absolutely necessary that the commanding officer be free to move personnel and organizational equipment from one section to another section of the railroad as conditions change. There is neither sufficient personnel nor organizational equipment to divide the battalion into several separate sections and then maintain efficient operation.

3. It is recommended that a provisional railway traffic company be formed and assigned to the railway operating battalion. During the recent operations it has been necessary to use a large percentage of the officers and enlisted personnel of the operating battalion for this work, which deprived this organization of many of its technically trained personnel. (Note: A separate recommendation will be forwarded on this subject.)

APPENDIX "F"
PETROLEUM STORAGE AND DISTRIBUTION

FOREWORD

During the early stages of planning for the campaign of Sicily by Force 343, considerable thought was given to the possibility of supplying the airfields at Ponte Oliva and Comiso with bulk 100 Octane airplane gasoline as soon as possible after these fields fell into our hands and also supplying the ground forces with bulk 80 Octane MT gasoline. The thought being that such a project would assist to alleviate the necessity of hauling gasoline in packed containers over the beaches and to eliminate the return or empty containers to the mainland for refilling, to reduce losses by leakage and to a great extent reduce road haulage. To achieve this it was planned to erect bolted steel storage tanks at suitable locations near Gela, construct a 4" military pipeline to both Ponte Oliva and Comiso airfields and erect such storage as would be necessary at each of these airfields.

PLANNING

The details of plans for the erecting of storage tanks and construction of pipelines were as follows:

The 1st Phase of project which was to be completed by D+8 called for the erection of one 5,000 barrel tank at Gela and one 1,000 barrel tank at each of the airfields, and construction of 7-1/2 miles of pipeline to Ponte Oliva Airfield. By D+12 it was hoped to complete a second 5,000 barrel tank and construct 23 miles of pipeline to Comiso Airfield. This project was to provide 12,000 barrels of 100 Octane gasoline storage for use by the Air Corps.

The Second Phase called for erection of six 5,000 barrel tanks of which two were to be completed by D+16, two by D+20 and the remaining two by D+24. It was intended that the first two 5,000 barrel tanks would be used for 100 Octane and the remaining six for V-80 gasoline.

In the initial stages it was also expected to fill empty containers from these storage tanks.

Berthing and discharging of tankers was to be accomplished by either making use of a known fishing pier at Gela which it was hoped would be capable of berthing shallow draft tankers or by construction of a submarine pipeline approximately 3,000 feet in length, at which depth it would be possible to handle vessels of average draft. If the submarine line was to be constructed the U.S. Navy had agreed that moorings would be constructed so that tankers could be anchored while discharging.

Phased requisitions covering tankage and pipeline equipment and material were prepared and plans were for the material to arrive in Sicily in two periods. The material necessary in the First Phase of construction was to arrive on D+4, Second Phase to arrive on D+8 convoy.

The 696th (formerly 2602nd) Engineer Pipeline Company was assigned the task of construction and operation of all installations planned. This unit was to arrive in Sicily on D+4 convoy.

ACCOMPLISHMENT OF PLAN

The 696th Engineer Pipeline Company arrived at Gela on D+6; disembarkation of personnel and equipment was completed by D+8. Material for the construction of projects started arriving on D+6, but was badly scattered along the Gela beaches which required considerable time on the part of pipeline personnel in locating and assembling.

A reconnaissance indicated that the fishing pier, while badly damaged by bomb hits, could be used for berthing shallow draft tankers. Berthing depth at end of pier is approximately seventeen (17) feet.

The First Phase of plans which included erection of one 5,000 barrel tank, 4" pipeline to Ponte Oliva Airfield and three (3) 4" lines from tanker berth at end of pier to shore storage was completed and water tested by D+11 and construction of second 5,000 barrel tank was in progress. The first tanker with 10,000 barrels of 100 Octane gasoline was discharged on D+11. Because of delay in the arrival of material such as pipe, tanks and pumps, the pipeline to Comiso Airfield and erection of storage was not completed until D+26 when line was placed in operation.

In the meantime an additional 5,000 barrel tank was erected at the Gela tank farm.

The entire installation on completion in the Gela Area consisted of the following:

3 - 5,000 barrel shore tanks located near Gela pier
3 - 4" pipelines from tanker berth at end of pier to shore storage
7-1/2 miles of 4" pipeline from shore storage to Ponte Oliva Airfield

SECRET

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

SECRET

1 - 1,000 barrel tank at Ponte Oliva Airfield plus approximately 1,650 barrels of existing storage which was also connected making a total of 2,650 barrels storage at Ponte Oliva Airfield. 22 miles of 4" pipeline was laid from Gela storage to Comiso Airfield

1 - 1,000 barrel tank at Comiso plus existing storage connected amounting to 3,276 barrels. Total 4,276 barrels storage available at Comiso Airfield. A grand total of 19,926 barrels of 100 Octane gasoline is now available in the Gela Area.

Dispensing facilities were installed at Gela shore storage and at both Ponte Oliva and Comiso Airfields.

Tankers at the time of this writing are making regular scheduled deliveries and these airfields are being supplied 100% from bulk storage.

Due to the rapid advance of our forces which made available the existing storage at Port Empedocle and Palermo, the Second Phase of construction program which called for erection of six (6) 5,000 barrel tanks at Gela for 80 Octane gasoline was abandoned.

PORT EMPEDOCLE

After the fall of Port Empedocle it was decided to provide V-80 gasoline storage by making use of the existing storage facilities.

Existing storage found was as follows:

Three (3) 3,600 barrel tanks underground near Port Empedocle, tanks had been used for Diesel Oil. Two of these tanks were cleaned for V-80 gasoline use and connected to a 4" pipeline which was laid to the tanker berth. The remaining tank was left for storage of Diesel fuel.

Use was made of approximately 1,650 barrels of existing underground and above ground steel storage located at the Standard Bulk Plant near the railroad depot. A 5,000 barrel steel bolted tank was also erected at this point and a six (6) car loading rack constructed for loading tank cars. A 4" pipeline was laid from this storage to the underground storage mentioned above so that tankers can discharge to either or both installations. Berthing depth for tankers is twenty (20) feet. Complete canning and drumming facilities were installed. The first tanker was discharged 3 August. Total storage available at Port Empedocle amounts to 13,850 barrels.

PALERMO

Considerable storage space was found at Palermo which is enumerated as follows:

Underground storage at the Uditore Tank Farm located about three miles west of town. This storage consists of three 17,580 barrel concrete metal lined tanks for gasoline storage and two 11,400 barrel concrete tanks for Diesel fuel. Two eight inch pipelines, one for Diesel and one for gasoline, feed this storage from tanker berth at Banchina Quattrovente, a distance of approximately three miles.

A rail tank car loading rack connected by pipeline to Uditore Tank Farm was constructed at the railroad spur near Lolli station. Loading rack will accommodate six cars.

A 5,000 barrel steel bolted tank was constructed at the Uditore installation and a four inch pipeline laid to the Palermo airport with connection to the existing storage amounting to approximately 125 barrels.

The first tanker with 19,000 barrels of V-80 gasoline was discharged 17 August 1943.

Naval storage found at Palermo consists of twelve underground concrete storage tanks having a capacity of 916,880 barrels which had been used for fuel oil. A fourteen inch pipeline connected this storage to the tanker berth. Complete pumping facilities for discharging tankers and servicing Naval Craft were found and minor repairs necessary to operate facilities have been completed. Connections to ten of the above mentioned tanks and feeder lines were found to be badly damaged by demolition charges.

CONCLUSIONS

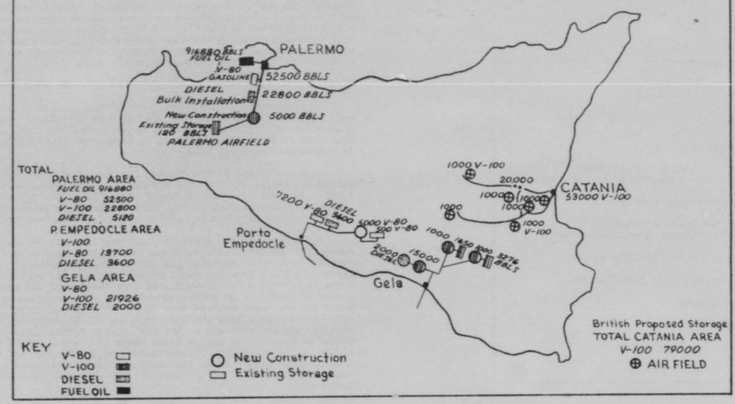
In view of the difficulties encountered in the initial stages of operations in Sicily, it is generally conceded that plans as originally made had gone off remarkably well. However, certain lessons were learned which should be noted for guidance in future operations.

1. Future operations which require pipeline and storage construction must be carefully coordinated by the Engineers, through G-4, with the Quartermaster, Air Corps and Transportation.

2. Units assigned to construction and operations should be relieved of their duties in sufficient time to enable them to enter into all plans laid for the procurement and movement of materials. This procedure is justified for the following reasons:

a. Depot personnel ordinarily have a very limited knowledge of pipeline materials and are not in many cases able to identify all items for shipment.

b. Units in the field of operations have to rely on materials shipped to perform their assignment and if these materials are not shipped as planned completion of projects will be delayed, as many of these items are not available from other Engineer stocks.



c. It is considered necessary that definite arrangements following the plan be made for movement of pipeline personnel. This is justified because other Engineer units would not be able to carry out the pipeline construction program on a schedule comparable to that of experienced personnel. Material, equipment and personnel should if at all possible, be loaded on the same ships.

d. Incidental and unforseen construction requirements will always enter into the bulk storage and pipeline construction picture. For this reason surplus of pipeline supplies must be ordered to take care of such emergency construction.

e. Careful and detailed studies should be made of beach areas where submarine lines are to be constructed, pertinent information such as shore conditions, tides, character of soil topography, and so forth, should be carefully studied in order to make proper selection of locations for submarine lines, storage tank sites and pipeline routes.

f. A pipeline and bulk storage construction program urgently needed can be successfully executed on schedule by careful planning, proper materials and skilled personnel.

BULK PETROLEUM STORAGE SICILY

Bulk Storage Facilities in Sicily in Areas Listed:

Location	No. of Tanks	Bbls Total Storage	Present Contents

D - "Over the Road" Movements (Outside Palermo Operational Area)
E - Cargo Truck Availability and Use
F - Organization of Highway Division
G - Miscellaneous
SECTION II RECOMMENDATIONS
SECTION III APPENDIX (Operational Data)

SECTION I

OPERATIONS

PHASE A - PLANNING

Planning for motor freight transportation, HUSKY Operation, was inaugurated the latter part of April with the organization of a Transportation Division in the G-4 Section, I Armored Corps. Immediate efforts were initiated to assemble a competent highway staff. However, only one experienced officer was available until 26 June when through efforts of Chief of Transportation AFHQ one other officer was assigned.

The Highway Transportation Officer with the help of attached personnel made a complete study of the Sicily road net and from tactical plans then in preparation developed an appreciation of the contemplated motor freight requirements. On the basis of this study it was recommended that ten (10) QM Battalions (Trk) be made available to meet supply requirements. Close contact was maintained with 1st Engineer Special Brigade and with the other agencies involved in the operation, to assure complete coordination.

In addition to general plans, steps were initiated to obtain equipment and supplies essential for efficient highway operation, to arrive in the theater by D+11. Approximately 2,500 pre-constructed signs were ordered from ABS and MBS to provide for the marking of main supply routes, dumps and port installations. Sign maintenance supplies were also requisitioned to arrive in the theater at the same time.

In the allocation of troops to Force 343 for the operation a Group Regulating Station was included to provide control personnel for highway operations. However a particular unit was not designated and, although every effort was made to obtain this designation, no decision had been made by 10 June. On 15 June, SOS, NATOUSA on direction of AFHQ ordered a detachment 2nd Group Regulating Stations (20 Officers - 40 E/M) to be assigned I Armored Corps to meet an urgent need for regulating personnel and to partially fulfill the commitment made for a complete regulating group. Considering anticipated needs in the theater this group was sufficient only for initial operation and a new request was informally submitted to G-1 and G-3, AFHQ for a decision on the balance of the group.

On 3 July, G-3, AFHQ advised informally that a group Regulating Station could not be provided, although set up in the 343 troop list. Hence a letter was initiated to Commanding General NATOUSA requesting authority to organize a Regulating Company (Provisional) of fifty (50) officers and 200 E/M, with the assigned detachment 2nd Group Regulating Stations as a cadre. This request was, because of the short time available, carried by hand through necessary channels at AFHQ. Through concerted efforts by the Highway Division, approval was granted on 7 July for organization of the 6623 Regulating Co. (Prov.). A liaison officer was immediately designated from the assigned cadre to represent 7th Army in organizing the provisional company. Personnel was obtained from 1st and 2nd Replacement Depots in Africa. At the time authority was granted for the organization a T/E was approved by G-1 AFHQ and this equipment was drawn from ABS concurrently with the organization procedure. The regulating cadre was scheduled to arrive in the theater on D+10. Shipping priority for the balance of the company was obtained to arrive in the theater by approximately D+20.

PHASE B - LANDING 10 JULY TO INITIAL PORT OPERATION 28 JULY

First elements of the Highway Division landed on Sicily from LST on beach east of Licata at 1100, 10 July 1943 (D plus 4). Party consisted of Highway Transportation Officer, Assistant, Motor Control Officer, and one enlisted man. Operation on the Island was begun by Highway at 1000, 15 July 1943, at Seventh Army Main Headquarters, Gela.

Recommendations of the Highway Division on traffic circulation were embodied in Traffic Section (Paragraph 5) of Adm. Order No. 2, 17 July which designated main and alternative supply routes to II Corps, and to 82nd Airborne Division and Provisional Corps. Highway personnel immediately made detailed traffic surveys of potential routes radiating from Gela and Licata.

In accordance with previous plans the 1st Engineer Special Brigade assumed responsibility for consolidation of all beach supply points on 17 July. The next day they began stocking the advance supply points of Agrigento and Caltanissetta by truck from the beach supply points. The laying down of an initial stock of 1800 tons was accomplished thru the use of 230 organic vehicles attached to the Brigade. No QM truck companies had yet been attached. On 19 July one QM Truck Company began hauling from Canicatti Railhead to Caltanissetta. Seventy-five (75) vehicles were obtained from the 107 AA Group on 21 July in order to meet the haulage problems of the fast moving front. These AA vehicles were returned as vehicles of the QM Truck Company's became available. In general DUKWS of the two QM Truck Battalions attached to the Brigade and trucks and DUKWS of the Brigade units were used on the beach and port to railhead operation with separate truck companies handling the more distant phases of railhead and over the road operation.

The Highway Division maintained close coordination with the 1st Engineer Special Brigade, which had assumed the functions of supply when the Divisions moved forward, and the supply lines lengthened.

Moving with main headquarters to Agrigento on 20 July, a road net circulation plan was developed in relation to supply lines for the Red, White and Blue tactical phases, overlay of routes being accompanied by the table showing highway distances necessary to supply forward points of Provisional Corps, 82nd Airborne Division, and II Corps. Coordination with 1st Engineer Special Brigade on movements was continued through these phases. At this time recommendations for allocation of functions and responsibilities over road movements between Army and Corps were made. By informal arrangement with G-3, 7th Army, the Highway Division inaugurated control of convoy movements on Army roads and coordinated inter-corps movements with respective G-3's.

Staff of Highway Section was supplemented on 23 July by arrival of Traffic Engineer and three enlisted men, and further on the following day when another officer was attached for temporary duty. All were from Detachment 2nd Group Regulating Stations which formed cadre of 6623 Regulating Company (Provisional), which had landed at Licata on 22 July.

Advance detail of Highway Division moved to Palermo on 25 July, and balance of the Division followed on the 26th. The following day Movements Control Officer reported for duty, on detached service from Regulating Company.

PHASE C - PORT OPERATION, PALERMO

Reconnaissance of the Palermo area for development of a traffic circulation plan was started immediately on arrival. All Special Staff Sections were instructed to "select depot and dump sites in the Palermo area and report their locations without delay to the Engineer, Seventh Army, in order that access roads could be repaired and a recommendation made on traffic circulation" (Letter 26 July AG to 1st Engr. Special Brigade, Provisional Corps, II Corps, 20 & 540 Engineer Regiments, on responsibility for coordinating repair and rehabilitation, Par. 4). Traffic engineering section of Highway Division worked in close liaison with services and Engineer, 7th Army, in selection and marking of dump sites and routes.

At 1600 on 28 July, initial motor freight operations at port were begun with sixty-nine trucks and nineteen DUKWS upon arrival of two LCT's; three coasters berthed shortly thereafter and discharge began at 1900 of the same day.

The Port of Palermo was operated initially by the 540 Engineers. Highway port operations were controlled by personnel of the Detachment (Cadre) 6623 Regulating Company (Provisional). This detachment, consisting of only nineteen officers and forty enlisted men, maintained a twenty-four dispatch and operational control of moter movements at the Port.

Until arrival of main group from Africa on 4 August, this cadre of the company had neither vehicular nor organizational equipment. The main group, consisting of twenty-eight officers (including liaison officer) and one hundred sixty enlisted men debarked from LST at 1900, 4 August, and five officers and eight enlisted men immediately reported for duty at the port.

Principal difficulties encountered in the beginning of Highway port operations were:

1. Lack of familiarity of dispatchers and drivers with locations in the city.

2. Lack of completely marked routes to destinations.

3. Lack of means other than color markings and code identifications for telling to what service and what dump of that service cargo should be directed.

4. General difficulties of blackout operation.

5. Coordination with services in operation of dumps and delay in selection of dump sites.

These difficulties were alleviated by: temporary marking of military routes by sign crews loaned by 540th Engineers. Temporary sign erection was practically completed 1 August.

Road Patrol, consisting of three (3) officers, constantly circulated over the city directing drivers to destinations. Wherever practical, convoys were formed at the port, and guided to dumps, either by road patrol or by guides requested from the services and the QM truck companies.

Liaison officers of the services assisted proper determination of cargo destination, but dispatch of cargo to destination was primarily accomplished by "dead reckoning" on the part of the Regulating Company.

First day's operations at the port showed the following results:

	First Shift 281600 to 290700	Day Shift 290700 to 291900	Total
Trucks	61	88	75 Average
Total Trips	58	225	283
Total Tons	165.5	636.8	802.3
Average trips per truck	1-	2.56	3.56
Average tons per truck	2.7	7.24	9.94

By way of comparison the same figures are shown for period 27 August, 1900 to 28 August, 1900:

	28-29 July	27-28 August	% increase
Trucks	75 average	230 Average	340
Total Trips	283	1800	535
Total Tons	802.3	4641.9	478
Average trips per truck	3.56	8.04	126
Average tons per truck	9.94	21.05	112

Dispatch of trucks and space available at Port Motor Pool made dispersion of vehicles at required minimum distances of seventy-five yards extremely difficult. Authority to close interval in pool, submitted to AGS G-4 in memorandum 29 July, was granted by Chief of Staff, with provision that each truck unit would be responsible for dispersion of vehicles on alerts.

During the first nine days of operation at the port, no telephones were in operation between the piers and the central dispatching office, and in order to secure trucks, it was necessary for dispatchers at shipside to walk to the central dispatching office or to the motor pool. Telephones were installed 6 August, and greatly increased the efficiency of the pier operation.

Due to shortage of supervisory personnel at the Port, the Highway Road Patrol initially was operated directly under the Highway Division, G-4. Road Patrol was instituted concurrently with initial port discharge, serving several initial and continuing necessary purposes. Initially it served as guide for vehicles from the port to dumps and return, especially at night. Its chief functions were control and policing of vehicle operation to detect and eliminate loitering, thus shortening turn around time. Equally important was a constant vigilance of dumps to locate and anticipate bottlenecks in unloading which would slow vehicle return to the port. The patrol, thru its transportation experience, was able in many instances to coordinate with the services by devising some discharge short cuts, and where correction could not be made on the ground, circumstances were reported to Highway Division or to the Port Office for necessary action thru higher channels. With dumps isolated and telephone communications scant, the Patrol performed an important liaison function.

Dispatching control of all vehicles of QM truck units assigned or attached to Seventh Army was assigned to the Division on 29 July, by memorandum from G-4 to all such units and to the 10th Port of Embarkation. General policy of centralized dispatch control was established and placed in operation as recited in detail in Appendix "I".

By 1 August, a total of eleven dumps had been designated, Ordnance and Quartermaster having three each, Signal two, and Air Corps, Chemical Warfare, Engineers and Medical one each. These dumps were located at distances ranging from .3 miles to 10.3 miles, with an average distance of 2.74 miles from the Main Port Gate.

On 4 August the four rail yards, which had been known by their local names, were designated Yards A, B, C, and L, and marked with directional signs to facilitate motor freight dispatching.

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

Permanent signing program was completed by 12 August. On 31 August approximately 500 signs marked 38 dumps and 35 miles on 16 alphabetically lettered routes. Dumps were numbered, with a definite block of numbers assigned to each service. By this time the 38 dumps were distributed among the services as follows: Quartermaster, 12; Ordnance 4, Engineers 1; Signal 3; Chemical Warfare 5; Air Corps 5; Medical 1; Organizational Equipment "Farm" 1; AMGOT 1; Staging Area 1; and 4 rail yards.

Distances from main gate of Port to dumps now ranged from .2 miles to 11.2 miles with average of 3.4 miles.

During discharge of UGS 11 (beginning 7 August) 215 tons QM Class I, 480 tons QM Class III and 700 tons Ordnance Class V were loaded daily for rail shipment east to railheads.

In coordination with 10th Port of Embarkation and Provost Marshal, Seventh Army, SOP for handling prisoner of war labor details at Port was established in Administrative Memo #3, 4 August.

The first Dispatch Log showing routing to the thirty dumps then in existence was published 12 August, accompanied by a mimeographed map showing dump locations and routes, and 350 copies were distributed to interested agencies. Supplements were published as needed. The system of military routes had been established by the Highway Division, and concurred in by Provost Marshal and Engineer Section, Seventh Army, Commander of Military Area, and AMGOT.

Lack of a positive air raid alert and all clear signal resulted in considerable confusion and lost time nightly. Such a signal was recommended early in the Port Operation, but the signal installed has been only partially effective. As a result of this situation, a detailed study of a port evacuation plan was inaugurated and is being presented to the 10th Port of Embarkation for execution.

Memorandum of G-4, 12 August established policy that selection of storage facilities be coordinated with Highway Division for harmony with general traffic circulation plan and adequate notice to Highway Division on any matters effecting its operation. Each service was directed to designate a liaison officer, available on twenty-four hour basis to the Highway Division.

Stock levels beyond original contemplated capacity of dumps, and ever increasing distance from port to dumps prompted recommendation (17 August) that Class I and Class III dumps be located adjacent to rail to minimize requirements of truck movement in loading cars, within a radius of five miles of port, and that Ordnance Class V dump be relocated in proximity to port with access by rail, and better facilities for operation by truck.

PHASE D - OPERATIONS OUTSIDE OF PALERMO

Road Movement Section, which had been established within the Highway Division Staff prior to arrival at Palermo, instituted operations immediately after issuance of Administrative Memorandum #3, dated 2 August, which established the axis of supply for North shore operations at Palermo.

In anticipation of operation, tables of highway mileages and necessary operating forms had been prepared to provide accurate control and information.

The principal function of Movements Section was to secure and organize vehicles to travel as convoys, provide specific orders for convoy commanders as to origin, destination, authority to pick up loads; to coordinate movements to prevent congestion; to establish routes and schedules; and later, to supervise and coordinate traffic control activities. Through the advance information thus furnished to Movements, and by close contact with all services, the section has been able to minimize empty vehicle movements thus speeding delivery of the necessary loads as well as greatly increasing efficiency of equipment use.

An example of this occured on the first major move arranged by the Movements Section on 4 August, when it became necessary to move rations and ammunition immediately from Agrigento and Licata to Palermo. A convoy of 170 trucks was partially loaded with equipment of the 104th Coast Artillery Barrage Balloon Battery, at that time debarking at Palermo Port, for movement to Licata. The convoy then loaded the necessary supplies and had returned to Palermo within thirty-six hours of request of the Highway Division for movement.

Movements from Palermo continued heavy until 10 August, the heaviest day being 7 August when 296 tons of ammunition were moved to San Stefano, in addition to personnel movements and normal movements of other supplies.

Following tactical advance and reconstruction of rail lines the movement by highway from Palermo diminished, and dispatch from forward railhead was substituted. Dispatch stations were inaugurated at Campofelice Railhead 7 August, Cefalu on 8 August, and at Tusa (San Stefano) Railhead on 8 August. Manning each dispatch station is a minimum of one team consisting of one Motor Freight Dispatch Officer and two enlisted men. From two to five truck companies have operated from these railheads, moving materials from railhead to local dumps, or to supply points at San Agata, Capo de Orlando, Barcellona, and other forward points. On 11 August, daily commitments for movement forward were 400 tons.

from Tusa. These truck companies also helped move personnel from the front at the end of the campaign, relocating units throughout the American Sector.

Close coordination between Army Services, Corps, 1st Engineer Special Brigade, and in some instances, individual divisions were required. One example was the emergency movement of Air Corps bombs from Termini and Palermo to Gela. Through coordination with II Corps and 1st Engineer Special Brigade, it was possible to divert and substitute trucks to meet this emergency commitment.

To expedite movements it was necessary to load direct at shipside for emergency over the road movements to meet demands for critical supplies for tactical units. Proper coordination and advanced planning for movements often increased operational efficiency by combining as many as six separate movements in a single convoy round trip.

In preparation for coordinated movement control a SOP for Motor Movements was approved as an annex to Administrative Memorandum #4, 28 August.

On 24 August an aerial survey was made of Control Station locations.

The first formal Highway Control Station was established in Palermo, west of junction of Highways 113 and 121 on 20 August. The dispatch station at San Stefano was already functioning in a dual capacity as Highway Control Station and Freight Dispatch Point.

The first scheduled organic convoy movement under this control was scheduled from a location west of Palermo to Catania on 27 August.

PHASE E: TRUCK AVAILABILITY AND USE

Each Quartermaster organization referred to began operation in the Sicilian Campaign with full T/E equipment of 48 vehicles per company, unless otherwise indicated. Personnel available under T/O, however, allowed for maximum vehicle operation on only a single shift, 24-hour basis. Limiting operations factor was therefore, driving personnel rather than vehicles. Each company was able to furnish, for regular 24-hour operation over extended period, only an average of 32 vehicles, or 2/3 of vehicle strength, this being accomplished only by pressing supervisory NCO's into service as drivers.

138th QM Company (Trk), short three men, landed at Port Empedocle 23 July, arrived at Palermo on the 27th and went into operation at Palermo Port the following day. One platoon was moved to Termini Immerese 30 July on DS with 540 Engineers in port operations there, returning to Palermo 28 August. In addition to the 48 2-1/2 ton trucks, this company operated three 10-ton Semi-Trailers.

144th QM Company (Trk) landed 29 July, arrived at Palermo the following day, and became available for dispatch the next day.

First Battalion, 27th QM Regiment (Trk) (Less Co. C, in States) landed 31 July, and was available for dispatch at Palermo 2 August. All three companies were dispatched for duty from Cefalu railhead August 5 and 7, then companies A and B went on to Tusa on 11 August.

Vehicles of three companies of 1st Battalion 46th QM Regiment (Trk), with drivers of one company were landed at Syracuse 19 July, and drivers shuttled vehicles to Licata, at which point balance of vehicles and personnel of the Battalion were landed on 23 July. The Battalion moved to Palermo on the 27th and operated there until transfer to FORTBASE, Catania, 28 August.

Second Battalion, 47th QM Regiment (Trk) arrived in the theater in July, Company F arriving and working at Canicatti Railhead on the 19th, and balance of the Battalion being in operation by the 25th. The following day companies F, G and H moved to Caltanissetta, moving supplies from that railhead to Petralia. These companies moved forward to Parata railhead on 5 August, hauling to Nicosia. Company F was transferred to II Corps on 26 August. Company E had been attached to 82nd Airborne Division and continued with that attachment until 25 August, at which time it came under Army control, and was immediately placed on DS to QM, Seventh Army.

52nd QM Bn. (DUKW) landed on South Beaches with initial assault, and continued operation there under 1st Engineer Special Brigade until 19 August, at which time the Battalion was ordered to North Africa.

53rd QM Battalion (DUKW) participated in landings 10 July, with Company D attached to 2nd Armored Division and balance of Battalion to 1st Infantry Division staying with that attachment until 30 July, when they reverted to Army control. Companies A and D were on DS to 540th Engineers, operating ports of Termini and Torremuzo, until 25 and 28 August respectively. 67 DUKWS were withdrawn from this organization for shipment to Africa on 19 August, and were partially replaced by DUKWS transferred from the 52nd QM Bn.

Two companies of 54th QM Battalion (Trk) had arrived in Sicily on 26 July, balance of battalion arriving by the 30th. One company was immediately sent to Caltanissetta railhead, thence to Parata on 5 August and to Nicosia on the 8th. Balance of the battalion operated, beach and port supply points on the south coast, all under 1st Engineer Special Brigade until the battalion was transferred to Army control (replacing 1st Battalion 46th), arriving Palermo 29 August, with initial dispatches on the same night.

Arriving in theater 2 August and reporting for dispatch the following day, all of the 55th QM Battalion (Trk) operated at the port on local dispatch at Palermo, until 12 August, when companies A and B were sent to Tusa Railhead, Company A returning to Palermo on the 18th.

To meet emergency requirements for trucks, units other than quartermaster truck organizations have been called upon to furnish trucks. For the first three days of port operation at Palermo the Company D, 205th QM Battalion (GS) furnished twelve vehicles, and the 3rd Infantry Division furnished 25.

The gap between departure of the 46th (last port operation 1900, 26 August) and arrival of the 54th (first operation 1900, 29 August) was filled by securing 25 trucks from the 2nd Armored Division (Service Battalion) and 50 trucks from Field Artillery units of the 9th Division (60th, 26th, 34th and 84th Battalions).

Dump trucks for coal and bulk material movements at the port have been furnished by the 437th Engineer Dump Truck Company (eight from 12 to 14 August) and the 427th Engineer Dump Truck Company (ten from 29 August).

For movement of cases, timbers, poles and pipe which because of size could not be handled in 2-1/2 ton cargo trucks, equipment has been borrowed from Air Corps and Engineering units. Captured Italian flat bed trailers have been adapted and put into condition for use behind 2-1/2 ton trucks.

HISTORY OF HIGHWAY DIVISION

PHASE F - ORGANIZATION

1. STAFF ORGANIZATION: The Highway Division, Transportation Branch, G-4 was organized to function both as a staff and operating unit, with part of the staff and all of the operating personnel being supplied by the 6629rd Regulating Company (Prov), which is controlled by the Division. As indicated by the accompanying organizational chart the Division is divided into five sections, each with a specific functional responsibility. The officer personnel in each of the sections was allocated in accordance with operational requirements.

To assure efficient operation and to continuously control all highway operating agencies the Division was operated on a 24-hour basis, all officers being on call at any time of the day or night.

In general, the functions of the five sections were as follows:

a Movements Officer - Planning and execution of all "over the road" supply movements; Control of Motor Freight Dispatch Officers operating QM truck units in the field; Control of convoy movements on all moves over Army road nets and inter-corps movements.

b Traffic Engineer - Selection and designation of military supply routes; preparation of highway circulation plans; signing and sign maintenance of supply routes, dumps and supply points; coordination with Engineer, Provost Marshal, AMGOT and other agencies on matters pertaining to traffic control, traffic regulation and circulation plans.

c Administrative Officer - Office control and records; liaison with Highway Port Officer on Highway Port Operations.

d Motor Control Officer - Control of all QM Truck Units and availability of cargo vehicles for movement of all supplies; allocation of cargo trucks to Movements Officer and Highway Port Officer for movement of supplies in their respective operations. Handling of miscellaneous dispatch requests.

e Highway Port Operations - Operation of all motor freight transport from shipside to rail yard or to dump with complete control of movement of every cargo vehicle through pier supervision, dispatchers and port motor pool operation. Control of Highway Patrol.

2. HIGHWAY PORT OPERATIONS: Staffed by personnel of the 6629rd Regulating Co. (Prov.) all operations are under direction of the Highway Port Officer, who was also commanding officer of the Regulating Company. Actual operations were supervised by an Assistant Highway Port Officer for each of the two shifts, day and night.

A pier supervisory officer constantly circulated over the entire Port area, coordinating operations as a whole, and solving operating problems as they

arose, as well as supplying the Highway Port Officer with current information on pier operating conditions. Shipside supervisory officers control and superintend actual loading and dispatching of trucks, which was done by EM dispatchers. Supervisors anticipate requirements, and order trucks sufficiently in advance of actual need to accomplish a steady supply, minimizing standing time at shipside.

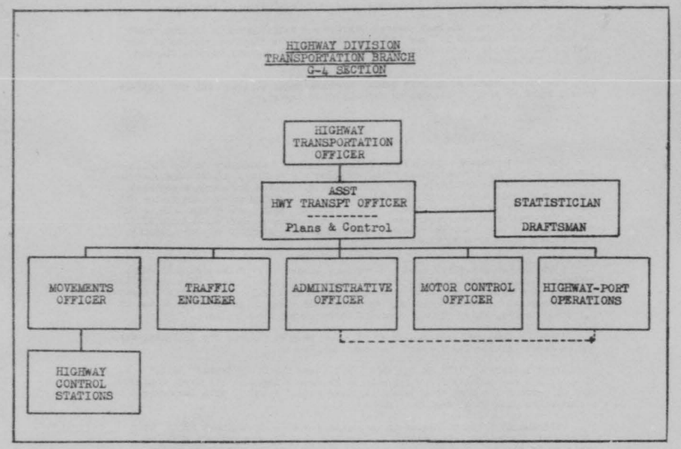
Orders for trucks at shipside were placed thru the Central Dispatching Office, and were there coordinated for relaying and actual movement from the Motor Pool. Routing of such ordersthru the Central office was necessary for smooth operation, particularly when "rationing" of trucks from the pool must be effected.

The administration and records section handled actual details of the central dispatching office, statistical compilation and analysis of dispatch tickets. Motor pool personnel dispatched trucks from the Pool, and coordinated operating matters with liaison officers of the truck organizations. Gate checkers verified dispatching of vehicles, and undue delays if any between shipside to gates.

A Road Patrol, serving directly under Highway Port Officer, policed operations outside of the Portaires, and , by furnishing information on unloading conditions to the Port Officer and his assistants, allowed anticipation and prevention of bottlenecks which might increase truck turn-around time.

SECRET

THIS PAGE IS DECLASSIFIED IAW EO 13526

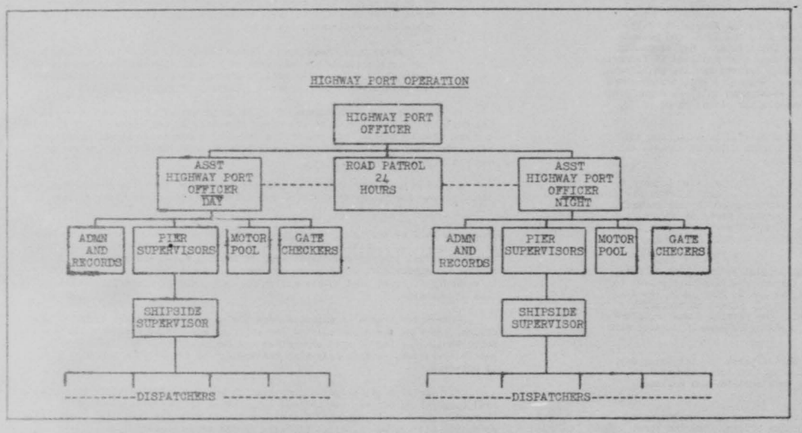


THIS PAGE IS DECLASSIFIED IAW EO 13526

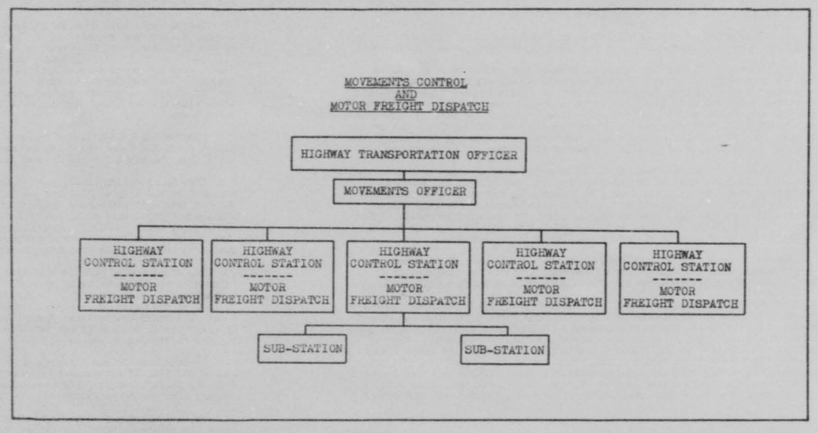
3. MOVEMENTS CONTROL: Movements control stations served the dual purpose of traffic control and dispatching. For traffic control purposes, the stations verify time schedule of convoys, coordinated movements where necessary, because of early or late arrival at check point, to prevent traffic conflicts. Where necessary, vehicles were checked to assure efficient use of cargo transport by limiting as much as possible "dead-head" operation. Organic convoys originating within Station territory were furnished road clearances by the Station, after coordination with the Movements Control Officer. Stations also served as liaison with Corps and Divisions using Army road net.

The dispatching function of Movements Control Stations included control of QM truck units in station area, provided transport for movement of supplies, supervised loading and dispatching of vehicles and formation and operation of convoys.

All movement information was cleared thru Movements Control Officer to adjacent control stations which were affected, assuring close traffic control of all convoy traffic on the Army Road Net.



Mobile sub-stations were located at important supply points which fed traffic into main control stations. By operating these mobile sub-stations it was possible to control convoy movements originating at out of the way points and assure a smooth flow of movements into the principal military supply routes.



PHASE G - MISCELLANEOUS

During the campaign the movement of military transport in the vicinity of towns and more densely populated areas was seriously handicapped by movement of animal drawn civilian vehicles on main supply streets and routes. The frequency of this interference and the resulting congestion made necessary some definite action to control civilian traffic. As a result of this continuing problem the Highway Division on 30 July prepared and recommended a set of traffic regulations for control of civilian traffic. The regulations were concurred in by the Provost Marshal, Engineers and AMEXT. Since the regulations were exclusively for civilian control they were published by AMEXT as "Avvisso No. 20", 4 August, and that agency made arrangements for enforcement by civilian police. In general, the regulations prohibited the use of military supply routes by carts and bicycles where alternate routes were available, limited speed of civilian vehicles, prohibited peddling on such thorofares and restricted civilians riding in military vehicles. In addition herded livestock was prohibited on such routes except for a minimum specified period.

In order to make most efficient use of cargo transport, during the campaign close liaison was maintained with the Provost Marshal for evacuation of prisoners of war from the front. Enclosures were located in close relation to main supply routes, and prisoners were moved back on vehicles which had moved supplies forward.

SECTION II

RECOMMENDATIONS

As a result of motor freight operating experience acquired in the TORCH operations and currently in the HUSKY operation, the Highway Division makes the following recommendations which it believes will facilitate planning on future operations and substantially increase efficiency of operation, both in initial and subsequent operational stages:

1. To assure adequate and concrete highway planning for contemplated operations in a new theatre, a thoroughly experienced highway planning staff of at least four officers should be provided to develop necessary planning, procure necessary supplies and form the nucleus of the staff and operating division upon inauguration of motor freight operation in the theatre.

2. Quartermaster truck battalions should be reinforced:

a. With sufficient driver personnel to provide operation of all vehicles on a two-shift, 24-hour basis from shipside to dump.

b. With 24' flat-bed 4-wheel trailers to be towed behind 2½-ton 6x6 cargo trucks - a minimum of five per company, for the movement of poles, pipe, timber, heavy cases and various other commodities which, because of size, cannot be transported in conventional 2½-ton cargo trucks.

c. With sufficient 4-ton wreckers and common 3rd echelon maintenance tools to allow a minimum of one company per battalion to perform its own repairs as a self-contained unit isolated from ordinary 3rd echelon maintenance facilities.

3. Prior to entering the theatre, adequate sign stock should be prepared to provide a rapid means of signing dump installations and local routes. Materials should be light in weight for easy handling and mounting, and accompanied by an adequate supply of maintenance equipment. In preference to prepainted signs, it is recommended that appropriate legend be prepared in the theatre to meet any conditions encountered.

4. At least four officers of the Highway staff should arrive in the theatre on D-day to be thoroughly familiar with the requirements of supply as they develop and to modify previously planned operational procedures, in order that operations may be smoothly organized as soon as motor freight movements under control of the Highway Division are instituted.

5. Adequate planning for efficient operation of motor freight transport under blackout conditions is of primary importance, and materials should be procured in advance to provide flourescent markings on signs and markings so as to assure some degree of night visibility.

6. For efficient port operation, a positive air raid signal, preferably of the visual type, to indicate "alerts" and "all clears" is essential to avoiding inefficiency through confusion. Efficient port motor freight operations cannot be maintained without such provision.

7. Provision should be made to inaugurate an adequate system of operational records as soon as motor freight operations are started.

8. Prior to entering the theatre all supply services concerned should have positive direction as to the selection and establishment of supply dumps in relation to efficient transportation operation.

4	Reports. a - Unit (1) Daily (2) Periodic b - To G-4 c - By Motor Control Section (1) Daily (2) Periodic
5	Cargo Vehicles requested from Seventh Army units.
6	Aid from G-4 Automotive Section.
7	Aids to Motor Control Section. ANNEXES "A", "B", "C", "D", "E", "F".

1. The "Motor Control Section" of Highway Division is formed to dispatch cargo vehicles for port operations, convoys, movement of supplies for the services, personnel moves, etc. The Port of Palermo is given first priority for vehicles, and any other dispatching is made according to the importance of the move.

2. It is understood that the "hoarding" of vehicles by this section is absurd, because tonnage and movements will pile up and would, at some future time, place a serious problem on our hands. However, certain policies have been made, and some requests for transportation are turned down. Some of these requests are listed here with explanations for their rejection, but the acceptance or rejection is up to the person who will dispatch the vehicle.

a. AMGOT. We often get requests from this organization for trucks to haul supplies for civilians, AMG personnel, and miscellaneous details. Except in extraordinary circumstances, these are refused because the AMG has control of all the civilian cars, busses, and trucks on the Island of Sicily. From all of these vehicles, even though it may place a burden on the civilians, it is believed that enough can be procured to supply the needs of that organization without hindering the operations of the Army.

b. Personnel. Because of the shortage of cargo vehicles on the Island, we have established the policy of making troops march to and from their destinations around Palermo. This is particularly true in regards to moving men to and from the staging area, the railroad stations, port, and stockade. We do, however, furnish transportation for the baggage and equipment of these men. (Many organizations to which we furnish transporation use some of it to carry personnel. The POW labor at the port is an outstanding example of this, but the trucks are out of our control, and the port is assuming responsibility of using cargo transportation for personnel, and still moving the required tonnage.)

c. POW. Prisoners march to the P of E for transfer to the United States, England, or Africa. They carry their own equipment.

3. Highway Form #1 (Annex "A") shows the form used to dispatch vehicles. The original is given to the organization furnishing the vehicles, and the representative of that organization signs the duplicate which is retained in our file.

a. Port. As was given in Par. 1, the port has first priority on vehicles. At 1500 each day, the port calls this office giving the vehicle requirements for the night shift of that date and for the following day shift. Organizations have their representatives in this office at 1700 to pick up the dispatch slips for the two shifts mentioned.

b. Miscellaneous dispatches are made during the day and vehicles are usually ordered by 'phone or messenger. When this is done by 'phone, no receipt for the request is obtained them, so a confirmation call is usually made.

c. Vehicles for over-the-road moves are dispatched by the Motor Control Section, but control of the movement is delegated to the "Movements" Section who coordinate the moves with other convoys over the official routes. Highway Form #2 (Annex "B") is the form used by the convoy commander, issued by this office, and returned by the convoy commander at the completion of the trip.

4. The reports delivered to and originating from this section are few in number and very simple. Information reports are made only on request.

a. Unit reports.

(1) Units under the control of the Highway Division submit a "Daily Vehicle Morning Report" for 2½ - T cargo trucks at 1000 each day. This form is shown in annex "C" and is self explanatory. Another form, Annex "D" prepared by the 53 QM Bn (DUKW) is the form made by that organization because of the two types of cargo vehicles - 2½ - T cargo trucks and 2½ - T amphibious trucks in use in that unit. The reverse of this form contains information pertinent to that unit, and as the one copy serves both that unit, and this office, it is accepted in lieu of our form.

(2) No other reports are requested on a regular basis. When a change of status of equipment occurs, a report is submitted, and we may also request a report of vehicles in Ordnance Shops, reasons for deadline vehicles, etc.

b. Motor Control Section.

(1) The Motor Control Section prepares a daily record of vehicles used the previous 24 hours by the Seventh Army installations (Annex "E"). The miscellaneous dispatches are broken down as shown by Annex "F" and the convoys and other pertinent data are also shown for record.

(2) Periodic reports are discussed above.

SECRET

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

5. When requests for vehicles are more than we can supply, and the requests are of sufficient importance, vehicles are drawn from the organic transportation of units of the Seventh Army, II Corps, and Prov. Co ps. These are requested for a specific length of time, and are returned to the organizations at the end of that period. This practice is not desired, and it is kept to a minimum, for Transportation Section units can generally supply the required vehicles.

6. The G-4 Automotive Section aids the Highway Division in many ways. As the Automotive Section handled the transportation prior to the formation of this separate section, they have much advice to offer regarding policies and operation. It gets periodic strength and deadline reports from each unit in the Seventh Army, and some of this information is used by us. It makes automotive inspections in unit areas, and gives advice to the unit on the truck operation, performance, and maintenance. And it is from the reports of that section, and the aid from it, that we request cargo vehicles from Seventh Army units to supplement our movements.

APPENDIX 2

OPERATIONAL PROCEDURE, MOVEMENTS CONTROL SECTION

1. At time of interview with Convoy Commander, or his representative, complete details concerning the convoy are recorded on form provided for that purpose. (Annex A).

2. Schedule is arranged setting forth speeds, halts, bivouacs, etc.

3. Schedule is then checked to see that there is no conflict with other schedules previously arranged.

4. If Corps Routes are involved it becomes necessary

   a. To inform Corps concerned of the move.

   b. To coordinate the move with any the Corps may have scheduled.

5. Maps, or strip maps, with route clearly indicated in crayon are issued on the basis of one (1) per march unit.

6. Convoy Authorization is granted by assigning convoy a number and completing "Convoy Auth. Form". (Annex B). This form clearly sets forth rules and regulations governing all convoys, and when completed, establishes specific regulation for the particular convoy in question.

7. Between the hours of 1800 and 2400 each day interested Movements Control Stations are informed of all details concerning convoys arranged for the next day.

8. Movements Control Stations will:

   a. Complete "Station Record of Movement" form. (Annex C).

   b. Complete "Daily Station Log" in duplicate (one for Hq) (Annex D).

   c. Report progress of all convoys to Hq, Movements Control.

   d. Report progress of all convoys to next station enroute.

   e. Report, investigate, and correct all irregularities.

   f. At specific times each day (0800 morning and 2000 evening) report strength to Headquarters. At this time communication is checked, clocks and watches will be synchronized.

9. Headquarters posts exact progress of convoys (on Convoy Control Sheet - Annex E - and later on bottom half of data sheet #1) and files completed data sheet when move has been completed.

10. Headquarters and Control Stations will endeavor to eliminate movement of vehicles not loaded to capacity.

I - ORGANIZATION

1. Your convoy designation is _____. (This number will be shown on the front of each vehicle)

2. Your convoy commander is _____.

3. You will place heavier loaded, slower moving vehicles at the head of your column.

4. Maximum number of vehicles per March Unit will be 20. Maximum number of March Units will be 5. Time Gap between March Units will be 3-5 minutes. Time Gap between Serials will be a minimum of 25 minutes.

5. With convoys of ten (10) vehicles or more an officer in a command vehicle will be in charge.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

II TIME AND SPEED SCHEDULE

1. Your Initial Point (IP) is_____.

2. The lead vehicle will pass IP at_____hours on_____19____.

3. Your convoy will conform to the following time table:

HIGHWAY CONTROL STATION	ARRIVAL TIME LEAD VEHICLE	DEPART TIME TAIL VEHICLE	REMARKS

4. Convoys of ten (10) or more vehicles will avoid stopping the whole column by sending a small advance party (including kitchen trucks when desirable) to check at all Control Stations on the assigned route(s) at least thirty (30) minutes ahead of the main body. Advance parties will thus be able to furnish requested information, receive instructions or schedules from Control Stations, and areas for bivouac, or escort.

III CONVOY OPERATION

1. Speeds:
   a. Speeds will be commensurate with safety at all times.
   b. Maximum speed on highways outside of city limits will be thirty (30) miles per hour during daylight hours and twenty (20) miles per hour during hours of darkness unless otherwise designated by military signs.

2. Density—Open country seventeen (17) vehicles per mile, i.e. a minimum distance between vehicles of one hundred (100) yards, to be maintained at all times. In cities and towns interval between vehicles will be retained and individual vehicles will reduce speed to required speed limits.

3. Flags—A blue flag will be carried on the lead vehicle and a green flag on the tail vehicle of each serial.

4. Guides—To aid in organisation of convoy at IP, to control movement of convoy through towns or over one-way bridges, or through intersections or other points of potential conflict, guides will be posted by Convoy Commander as needed.

5. Halts—Rests or halts for meals will not be made in towns, on bridges, defiles, curves, or with vehicles standing on the travelled portion of the roadway. Vehicle interval may be adjusted to meet exigencies of terrain characteristics on halts provided vehicles are never closer than seventy-five (75) yards one from the other.

6. Passing—No convoy will overtake another convoy proceeding in the same direction without specific authority shown in the Road Movement Approval.

7. Radio—Complete radio silence will be maintained except in an emergency.

8. Convoy Commanders will be responsible for discipline and policing of their convoys. Orders will be issued by Convoy Commander to prevent personnel from throwing any articles from moving vehicles.

9. Convoy Commanders may, at their discretion, clear highways of civilian vehicular traffic to the extent necessary to permit free passage of convoys.

IV SUPPLIES AND BIVOUAC AREAS

Current information concerning the availability of supplies, water points, bivouac areas, Ordnance units, First Aid Stations, and Hospitals can be obtained at Highway Control Stations or Highway Division, G-4, Seventh Army.

V VEHICLE BREAKDOWNS

Drivers of disabled vehicles will signal the following vehicles to proceed. Such vehicles will not be abandoned; they may be left under guard and must be reported to nearest Highway Control Station.

VI LIGHTS

1. Between sunset and sunrise all convoys will operate with "dim-out lights" and with marker lights lit.

2. Dim-out lights will conform to either of the following standards (AFHQ Cir. 59, 29 July 1943):
   a. Headlights will have the painted black-out shields as used in Great Britain.
   b. Headlights will have the face of the lense painted black with paint removed to allow for a crescent shaped space two (2) inches long and one-half inch high with top of space one (1) inch below center line of lense.

3. If vehicles are operated during an alert the marker lights will be lit.

VII AIR DEFENSE

In the event of Actual Air Attack, vehicles will halt at open interval along the side of the road and all suitable weapons will be brought to bear on attacking aircraft. Personnel not manning weapons will disperse and take cover.

VIII ACCIDENTS

1. In all cases of accidents the driver will immediately fill out the Drivers Report (Form No. 26) and Army Form A 3681 (Eng - It).

2. Form 27 - Investigating Officer's Report will be completed.

3. It will be the Convoy Commander's responsibility to see that the nearest Claims Office is advised through channels of all pertinent information. In the case of serious personal injury all possible assistance will be rendered and the facts reported in the most expeditious manner.

IX UNAUTHORIZED FIRING OF WEAPONS

Attention is directed to the fact that the careless and unauthorized discharge of firearms is a violation of the 96th Article of War. Personnel in convoy are enjoined from the unauthorized use of any weapon. Convoy, serial and march unit commanders will appoint the senior officer, non-commissioned officer or private in each vehicle to assume direct responsibility for the conduct of personnel in such vehicles and maintenance of discipline at all times.

MOTOR TRANSPORT DISPATCHING ORDER

To assure an accurate basis for statistical records and to provide necessary information for the control of all motor freight vehicular movements, a motor transport dispatching order is used. Each driver, upon his vehicle being loaded, is given this order in triplicate. One copy is picked up at the exit gate at the point of origin of the load and the order checked for correct destination; one copy is delivered to the officer or NCO at the dump to which the load is consigned; the remaining original dispatch order is receipted at the dump at the time of delivery of the load and is retained by the driver, being turned in to the Highway Division checker upon return of the driver and vehicle to the point of origin. Dispatching orders are collected periodically during each 24 hour period from the checkers and are sorted and tabulated in the Administration and Records office of the Highway Port Officer. These daily tabulations form the basis for all highway statistical records and reports.

A facsimile of the Motor Transport Dispatching Order is reproduced below to indicate the extent of information and data recorded thereon:

M. T. Dispatching Order

Driver must turn in receipted copy to port. Green copy to be retained by dump. If load is refused, telephone port for instructions for driver. If no telephone available, send driver back to port with explanation written on back of this ticket.

Quartermaster (Dumps 1-9 and 100-109 incl)

DUMP #9
Class III - On the east side of Highway #121 approximately 6 miles south of Highway #113. Distance from main port gate is approximately 11 miles.
ROUTE O - Highway #113 - Highway #121 to dump.

DUMP #101
Class I - On the east side of Via Amiro Giafar 0.7 mile south of Route O (Highway #113)
ROUTE O and #101 signs

DUMP #54
Air Engineer - On the north side of Via Lincoln (Route M) near the R.R. Station
ROUTE O-M to dump

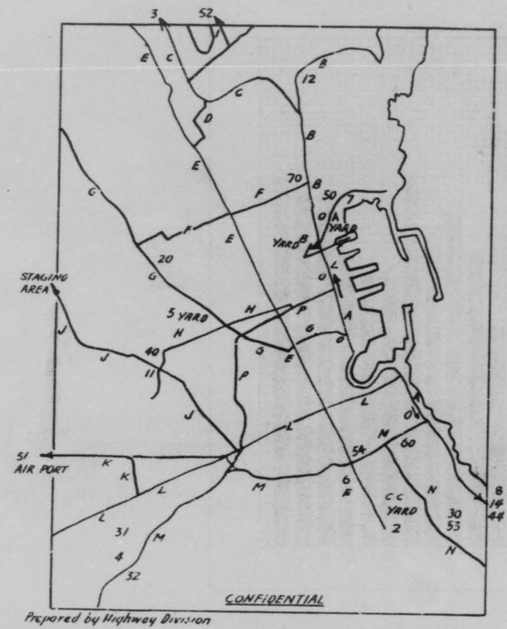
Medical (Dumps 60-69 Incl)

DUMP #60
All Classes - On the south side of Via Lincoln (Route M) near Via Duca Archirafi
ROUTE O-M to dump

Miscellaneous

DUMP #70
Organizational equipment - On the north side of Via Duca Di Verdura (Route F) west of Via Monte Pellegrino (Route B)

STAGING AREA
Route O-P-H-J or A-P-H-J to area



RAIL YARD A
East side of Via Cristoforo Colombo
ROUTE A or ROUTE O to yard

RAIL YARD B
West side of Via Monte Pellegrino
ROUTE A-B or O-B to yard

RAIL YARD C
West of Corso Dei Mille (Route N) south of Via Lincoln (Route M)
ROUTE O-M-N to yard

RAIL YARD L
North of Lolli Station. Entrance off Via Malaspina (Route G)
ROUTE A-P-H-G or O-P-H-G to yard

STOCKADE
South side of Corso Calatafimi
ROUTE O-L to stockade

TRAFFIC CIRCULATION PLAN

PALERMO 11 AUGUST 1943

H.Q. 7th ARMY, APO 758
Highway Division - Transportation Branch, G-4

12 August 1943

APPROVAL

The system of military routes outlined on the reverse side of this sheet has been approved by: Transportation Section G-4 and concurred in by the Provost Marshal and Engineer Sections, 7th Army, Commander Military Areas, and A.M.G.O.T.

PURPOSE

The routing system has been designed principally for the use of motor freight vehicles and convoys. Among the benefits to be derived from use of designated streets are: Assurance of direct access to all dumps, minimum interference by civilian traffic, good maintenance of the more desirable streets, decrease in number of "lost" trucks, and more efficient use of motor transport.

DIRECTIONAL MARKING

Traffic moving from the port to various dumps is directed by route signs with a letter designation and words "Dump Route". Traffic proceeding toward the port is directed by route signs with a letter designation and the words "Port Route". Where necessary, arrows are used in a vertical position to indicate straight through direction and in a horizontal position to show a turn to the right or left.

ROUTE DESIGNATIONS

The letters A to P (excluding "I") have been used to indicate the military routes. The letters have been assigned to the routes counter clockwise beginning with the north-south road along the port. For example, ViaFrancesco Crispi is "A" Dump Route". Via Monte Pellegrino is "B Dump Route", and Via Imperatore Federico is "C Dump Route". Only one letter is assigned to each route with the exception of the one along the port. In this case the letter "A" is used for northbound traffic and "O" for southbound traffic. This simplifies dispatching by always making the first route used "A" if the vehicle is to turn right out of the port and "O" the first route used if the vehicle is to turn left out of the port.

DUMP SIGNS

A series of numbers has been assigned exclusively to each service. All dumps are marked with signs giving the dump number. A dump sign has the word "Dump" on the top line, the service and class on the second line, and the dump number appears at the bottom of the sign.

JUNCTIONS

A sign reading "Junction Route" and the route letter is placed ahead of the intersection of routes to furnish advance notice of a junction with another route. For example, a driver proceeding along "B" Dump Route will find a sign reading "Junction RouteF" about 150 feet before the intersection with route F.

APPENDIX 16

REF: PP-4 C-P

COPY NO._____

Hq. Seventh Army
A.P.O. #758, U.S. Army
28 Aug. 43 1600B

ANNEX NO. 1 to ADMINISTRATIVE ORDER NO. 4

S. O. P. MOTOR MOVEMENTS

I PRINCIPAL ARMY TRAFFIC ROUTES:
The routes shown as principal supply roads, Par 4a (1) Administrative Order No. 4 this Headquarters, will be designated as Principal Army Traffic Routes. The movement of convoys of ten (10) or more vehicles upon these routes or while crossing these routes will be coordinated through Army Highway Control Stations.

II CORPS RESPONSIBILITY:
Coordination with and control by Army on these routes does not relieve Corps from the responsibility of march discipline and convoy policing of their own march units. Each Corps will be responsible for full control of motor movements on other roads within each Corps Area.

III ARMY HIGHWAY CONTROL STATIONS:
The following Army Highway Control Stations and substations will be established:

	Location	Date Open
1.	Palermo - 2 miles west of Jct Hwy 113 and Hwy 121	Now Open
1.A	Junction of Highway 113 and road to Cinisi near Terrasini	To be announced
2.	Agrigento - Junction of Highways 118 & 115	28 August
2.A	Licata - Junction of Highways 115 & 123	To be announced
2.B	Gela - Junction of Highways 115 & 117	To be announced
3.	Six (6) miles east of Termini Imerese Junction of Highways 120 & 113	26 August
4.	S. Stefano - Junction of Highways 113 & 117	26 August
5.	Trapani - Junction of Highways 113 & 115	To be announced

Additional Army Highway Control Sub-Stations will be established as required. Corps will be advised of changes and additions.

6. Army Highway Control Stations and Sub-Stations will be marked with Highway Signs at the site. Informational or directional signs will be placed strategically on the routes.

IV CORPS HIGHWAY CONTROL STATIONS:
Corps may utilize Army Highway Control Stations where feasible for regulation of intra-corps movements and may establish highway control stations upon corps controlled routes.

V MOTOR MOVEMENTS PROCEDURE:
1. Convoy commanders will be responsible for adherance to the following operational procedure prescribed, as well as any special instructions given when road movement authority is granted or those given by Army Control Stations encountered enroute.
2. Unit commanders or Highway Freight Dispatchers will not dispatch more than four (4) vehicles individually on over-the-road movements except in an emergency. Five (5) or more vehicles will be formed in convoy under a convoy commander.
3. The commanders of all convoys of ten (10) or more vehicles which involve movements upon or crossing the above routes or into VIII Army Area will contact the nearest Army Highway Control Station or Highway Division, Transportation Branch, G-4, 7th Army, before movement is made. When clearance has been arranged, convoy commander will be given road movement approval and instructions in written form where practicable.

VI CONVOY ORGANIZATION:
Convoy organization will be based on the following principles unless Convoy Movement Authority specifically alters any factor:
1. Maximum number of vehicles in any one march unit.....20
2. Maximum number of march units in any one serial.....5
3. Time Gap between march units.....3-5 minutes
4. Time Gap between Serials.....Minimum of 25 minutes
5. With Convoys of ten (10) vehicles or more an officer in a command vehicle will be in charge.

VII CONVOY OPERATION:
Convoy operation will conform to the following regulations unless Convoy Movement Authority specifically authorizes such change.
1. Speeds:
a. Speeds will be commensurate with safety at all times.
b. Maximum speed on highways outside of city limits will be thirty (30) miles per hour during daylight hours and twenty (20) miles per hour during hours of darkness unless otherwise designated by military signs.
c. The maximum speed on city streets will be twenty (20) miles per hour during daylight hours and fifteen (15) miles per hour during hours of darkness unless otherwise designated by military signs.
2. Density—Open country seventeen (17) vehicles per mile, i.e., a minimum distance between vehicles of one hundred (100) yards, to be maintained at all times. In cities and towns interval between vehicles will be retained and individual vehicles will reduce speed to required speed limits.
3. Flags—A blue flag will be carried on the lead vehicle and a green flag on the tail vehicle of each serial.
4. Markings—The Convoy Commander will be responsible that each vehicle is marked with the assigned convoy number. Instructions on marking will be furnished when Movement authority is granted.
5. Guides—To aid in organization of convoy at IP, to control movement of convoy through towns or over one-way bridges, or through intersections or other points of potential conflict, guides will be posted by Convoy Commander as needed.
6. Halts—Rests or halts for meals will not be made in towns, on bridges, defiles, curves, or with vehicles standing on the travelled portion of the roadway. Vehicle interval may be adjusted to meet exigencies of terrain characteristics on halts provided vehicles are never closer than seventy-five (75) yards one from the other.
7. Passing—No convoy will overtake another convoy proceeding in the same direction without specific authority shown in the Road Movement Approval.
8. Radio—Complete radio silence will be maintained except in an emergency.
9. Advance Parties—Convoys of ten (10) or more vehicles will avoid stopping the whole column by sending a small advance party (including kitchen trucks when desirable) to check at all Control Stations on the assigned routes at least thirty (30) minutes ahead of the main body. Advance parties will thus be able to furnish requested information, receive instructions or schedules from Control Stations, and areas for bivouac, or escort.
10. Convoy Commanders will be responsible for discipline and policing of their convoys. Orders will be issued by convoy commander to prevent personnel from throwing any articles from moving vehicles.
11. Convoy Commanders may, at their discretion, clear highways of civilian vehicular traffic to the extent necessary to permit free passage of convoy.

VIII SUPPLIES AND BIVOUAC AREAS:
Current information concerning the availability of supplies, water points, bivouac areas, Ordnance units, First Aid Stations, and Hospitals can be obtained at Highway Control Stations or Highway Division, G-4, Seventh Army.

IX VEHICLE BREAKDOWNS:
Drivers of disabled vehicle will signal the following vehicles to proceed. Such vehicles will not be abandoned, they may be left under guard and must be reported to nearest Highway Control Station.

X LIGHTS
1. Between sunset and sunrise all convoys will operate with "dim-out lights" and with marker lights lit.
2. Dim-out lights will conform to either of the following standards (AFHQ Cir. 59, 29 July 1943):
a. Headlights will have the painted black-out shields as used in Great Britain.
b. Headlights will have the face of the lense painted black with paint removed to allow for a crescent shaped space two (2) inches long and one-half inch high with top of space one (1) inch below center line of lense.
3. If vehicles are operated during an alert the marker lights will be lit.

SECRET

XI AIR DEFENSE:

In the event of Actual Air Attack, vehicles will halt at open interval along the side of the road and all suitable weapons will be brought to bear on attacking aircraft. Personnel not manning weapons will disperse and take cover.

XII ACCIDENTS

1. In all cases of accidents the driver will immediately fill out the Drivers Report (Form No. 26) and Army Form A 3681 (Eng - It).
2. Form 27 - Investigating Officer's Report will be completed.
3. It will be the Convoy Commander's responsibility to see that the nearest Claims Office is advised through channels of all pertinent information. In the case of serious personal injury all possible assistance will be rendered and the facts reported in the most expeditious manner.

By Command of Lieutenant General PATTON:

HOBART R. GAY
Brigadier General, GSC,
Chief of Staff.

OFFICIAL:

W. G. CALDWELL,
Lt. Col., A.G.D.
Adjutant General

     - a. Animals
     - b. Saddles
     - c. Miscellaneous Equipment

1. Planning and Preparation:

In anticipating the necessity of establishing adequate pack animal transportation for the Sicilian Campaign, an Assistant G-4 officer, Seventh Army, was assigned this duty in the latter part of June, 1943. Preparations in Africa consisted of receiving 200 Phillips Cargo Pack Saddles and 85 light riding saddles shipped from the United States. Near Ferryville, 109 horses and mules captured from the enemy were kept, but because of their poor physical condition and lack of shipping space, they were left to be sold to the public at auction. The Phillips Cargo Pack Saddles were later used in the Sicilian Campaign, 125 going to the 9th Division and 75 to the 3rd Division. The light riding saddles, plus some 200 Italian pack Saddles and other minor supplies, were left in reserve.

2. Sicilian Campaign Activities:

I. Procurement of Campaign Animals and Equipment.

By reason of the rough terrain bounded by the towns of Cefalu, Caltanissetta, Catania and Messina, about 4,000 pack animals were necessary for the completion of the Campaign. Animals used in this territory were captured from the Italian Army, bought, or rented from the civilian population. A small percentage was brought over from Africa with the respective units. Many civilian animals were commandeered by our soldiers along their route of combat. Units procuring civilian animals would have the civilian police call in the horses and mules in their town for the unit to select from. The unit requisitioning officer and unit Veterinarian, a civilian Veterinarian and town representative, along with the animal owner, were usually present at the time the sale or rental was made. A value was placed on each animal and a rental value of 50 Lire per day was paid the owner with the understanding that if the horse or mule were lost or killed, the agreed price, plus rental fee, would be paid or a like animal from our forces would be substituted. Average prices paid for animals are as follows:

Mule	$150.00
Horse	120.00
Donkey	40.00

Mares were $10.00 less than the price of male animals.

The animals were distributed by truck to the troops for combat and supply use. The average pack carried weighed between 250-275 pounds, consisting of water, rations, signal equipment and ammunition. In addition to the animals, the Allied Forces made use of many pack Saddles, carts and wagons. These articles of equipment were likewise secured from the Italian Army and the civilian population, paying $60.00 for carts or wagons and $40.00 for saddles. This equipment was also returned to the owners at the end of the Campaign.

II. Forage and Conditioning.

Generally speaking, at the outset of the Campaign the animals were in fair condition, weighing approximately 900 pounds on the average and standing 14 hands high. In this respect, they are similar to the Texas mule except they are a small or boned animal. However, due to hard use of the animals and also the lack of suitable forage, they lost some 30-50 pounds each during their 15 days use. There was a noticeable lack of suitable forage available for horses and mules. Oats, favo or mule beans, fieno hay, bran and native grass, both green and dry, and salt were used as forage. This was secured from the civilian population, the Italian police, and along the route of combat. Prices paid for forage are as follows:

Oats	$ .035 per kilo (2.2 lbs)
Favo Beans	.025 per kilo
Hay and straw	.01 to .02 per kilo

About 8 pounds of grain and 10 pounds of hay were fed to each animal per day when the forage was available. The favo beans were not considered satisfactory and the African Mules didn't like the wheat. There was also difficulty in getting forage and water to the forward areas and it was necessary to rotate the animals, that is, when some of the mules were hauling supplies, the others were being fed and watered at the mulehead.

III. Personnel.

Forces using pack animals and equipment were the 1st, 3rd, 9th, 45th, II Corps, Provisional Corps and the French Goums.

a. Mule Leader.

To operate efficiently, one mule or horse leader per animal is required. Certain personnel such as in the heavy weapons company can be used for this purpose, but additional personnel are required to lead animals which do not form part of the organic transportation. This is necessary in order not to reduce the combat strength.

b. Trained Personnel.

At least 4 pack Masters and one stable Sergeant should be assigned to a regiment which is about to take part in this type of operation. A Regimental Veterinarian is necessary for lengthy operations.

IV. Disposition of Animals.

With the end of the Campaign, every effort was made to return the animals to their former owners. The various owners painted identification numbers on their animals, or branded their hoofs to facilitate their return. Of the 4000 animals used, approximately 1500 were killed by enemy action. More were rendered unserviceable because of bad feet, saddle sores or bad physical condition. Many of which we have no record, were turned loose when they were of no further service to our troops.

3. Improvement Suggestions:

I. Size of Pack Trains.

In future operations, the pack animals should be sent out in groups of 10-12 to reduce the casualties from enemy action. A block and tackle carried with each group of animals to aid in crossing the more difficult terrain, would help.

II. Special Equipment.

Veterinarian kits and supplies should be issued and experienced horse-shoeing squads should be formed with each regiment.

III. Recommendations for Animal and Equipment T/O:

The following is a suggested T/O for a regiment:

a. Animals.

320 Mules
31 Riding Horses

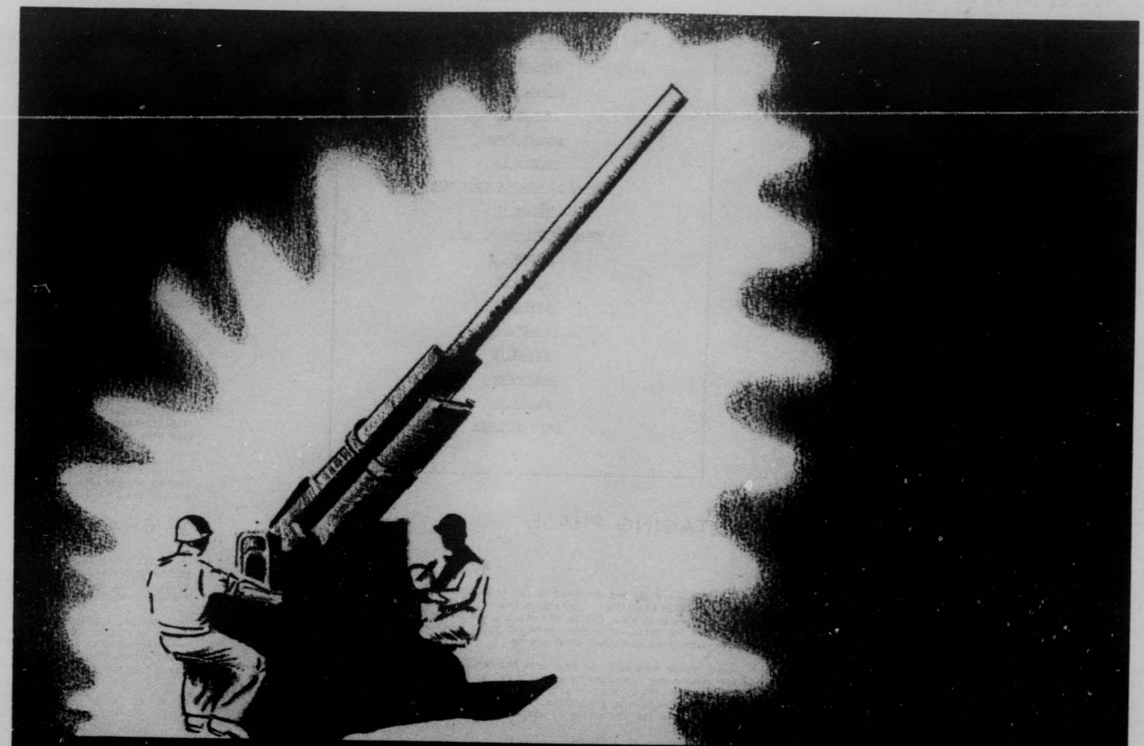
Distribution as follows:

Organic	Horses	Mules
Regt Hq	5	5
Bn (each)		
Attach Bn		10
Hvy Weapons Co	1	34
Rifle Co	1	5
Bn Hq	4	6
Total (Regt)	29	200
Administrative		
Service Train	2	180
	31	380

b. Saddles.

320 Pack saddles
31 riding saddles complete with saddle bags
30 litter saddles (top and not side type, i.e.) (French Goum Type)

c. Miscellaneous Equipment.



1 Halter per animal
1 Lead rope per animal
1 Feed bag per animal
1 Bucket per 5 animals
1 Grooming set per animal- brush, curry comb, hoofhook.

It is felt that these are minimum requirements and it is further urged that these provisions be carried into effect prior to embarkation if the operation is an overseas one, or prior to starting on a land operation.

REPORT OF THE ANTI AIRCRAFT OFFICER

I. REQUIREMENTS PHASE

Based on initial studies of the tactical plan ENSA - FISH - GROG - HOOK prior to 15 March 1943, a request was made to AFHQ by the Artillery Officer, I Armored Corps, Reinforced, for an allotment of a small number of Antiaircraft Artillery units. As the plan developed it appeared that further study was required. On 11 April, an Antiaircraft Artillery Officer was assigned to assist the Artillery Officer in revising his estimates. On 20 April a new request was made to AFHQ based on the new estimates for the maximum requirements. On 10 May 1943, it was mutually agreed upon by the Antiaircraft and Coast Defense Section, AFHQ and the Artillery Section, I Armored Corps, Reinforced to allot units to Operation Husky substantially as follows:

4 Regiments
8 Separate Gun Battalions
10 Separate Automatic Weapon Battalions
5 Separate Searchlight Battalions
10 Separate Airborne Batteries
2 Brigade Headquarters
6 Group Headquarters
1 Harbor Defense Battalion

Further study after revision of the original tactical plan to CENT- DIME - JOSS - KOOL showed no need for more units.

II. ATTACHMENT PHASE

At the conclusion of the Tunisian Campaign all AAA units nominated for HUSKY were either in staging area following arrival in Africa or protecting vital areas in Tunisia and Algeria. Since more units were required for the Operation than had been engaged in Tunisia, the additional units had to come from those newly arrived in the theater and still in the process of being equipped. In addition a proportion of the new units was required to replace units of the HUSKY troop list, still in tactical positions, prior to shipment for Sicily.

A list of units to be assigned First Armored Corps, (Reinforced) was prepared by AFHQ in conjunction with Artillery Section, First Armored Corps, (Reinforced), showing present employment, availability and dates on which units should be attached to Sub-Task Force or moved to staging area. A shortage of equipment was immediately apparent and priority list was given the Base Section in order to insure the proper units being equipped at the proper time. Constant checking by this Section was required to get units out of the staging area on time. Two Automatic Weapons Battalions which had been in active combat in Tunisia were also in the staging area at this time being equipped with self-propelled Guns. No units in the staging area were under the control of First Armored Corps, (Reinforced) at this time. All movements and attachments were made by AFHQ or Fifth Army, on recommendation of this Section. Many units could not be relieved as early as desired because organizations in staging areas were not being equipped as rapidly as planned.

Two considerations governed the sub-allotment of AAA to Sub-Task Forces. The first was consideration of AAA requirements for the combat elements. The second was the vital points, as ports and airfields, that were in the sector of each Sub-Task Force. As a result of careful study and estimated rate of advance, one Self-propelled Battalion, one Automatic Weapons Battalion and one Gun Battalion were given to each assault Sub-Task Force. Then because this would be inadequate for defense of vital objectives, a Regiment was given to JOSS as they had the only port. This would make available in Sicily, as soon as assault Sub-Task Forces were complete, four Gun Bns, four AW Bns, four SP Bns, one S/L Bn. It was expected this would be completed by D plus 8. This was not considered adequate, but was the best that could be expected with the limited lift available. Again based on a predicted rate of advance, the rate of flow of the AAA remaining under Army control was set up. This was combined, in the Artillery Section, with Field Artillery units and the combined list was then fitted in with lists of other sections.

The Army plan in brief for the initial stages provided the Sub-Task Forces with sufficient AA to protect their rear area installations pending the arrival of the 34th AAA Brigade on or about D plus 8. An AAA Group Headquarters was provided each assault force to plan and coordinate this defense.

With the arrival of the 34th AAA Brigade, necessary AAA units attached to Sub-Task Forces, except Self-propelled Battalions, needed for rear area defense were to be attached to the Brigade, the Brigade assuming responsibility for this defense. The 2626 AAA Brigade would remain in North Africa and supervise training, equipping, and shipment of units remaining in North Africa.

On approximately D plus 50, the 2626th AAA Brigade was scheduled to arrive. At that time the area of responsibility would be divided with the 34th Brigade on order from this Headquarters. The 8 AAA Group Headquarters would then assume responsibility for shipping the remaining AAA units to Sicily.

Recommendations

III. STAGING PHASE

Sub-Task Force AAA was attached to and joined Sub-Task Forces as rapidly as they could be made available. Amphibious training was conducted at the PAITC for as many units as possible. During the staging and loading for the assault, units scheduled for the follow-up convoys were set up to provide defense for Sub-Task Force concentrations and other vital points.

Force Troops were relieved from area defense in North Africa as rapidly as possible after D-Day according to schedule set up by AFHQ, based on our priority of shipment, and sent to staging area. All Force AAA units were under operational control of 2626 Brigade in Perryville. Units not immediately scheduled for shipment were deployed for protection of staging area.

IV. ASSAULT PHASE

For the initial assault operation the following AAA units were attached to Sub-Task Forces as indicated:

JOSS (Licata and two adjacent beaches)
106 AAA AW Bn (SP)
443 AAA AW Bn (SP)
436 AAA AW Bn
688 AAA MG Btry (AB)
689 AAA MG Btry (AB)
105 AAA Group
2 RAF Bln Detachments

DIME (Gela and two adjacent beaches)
105 AAA AW Bn (SP)
103 AAA AW Bn
107 (A & B AAA AW Bn
690 AAA MG Btry (AB)
691 AAA MG Btry (AB)
692 AAA MG Btry (AB)
693 AAA MG Btry (AB)
106 AAA Group
2 RAF Bln Detachments

CENT (Scoglitti and three adjacent beaches)
441 AAA AW Bn (SP)
400 AAA AW Bn
694 AAA MG Btry (AB)
695 AAA MG Btry (AB)
696 AAA MG Btry (AB)
697 AAA MG Btry (AB)
103 Barrage Balloon Btry (VIA)
107 AAA Group
1 RAF Bln Detachment

82nd AB Division
80 AAA AW Bn (AB) (Organic)

2nd Armored Division (Floating Reserve)
107 AAA AW Bn (less btries A & B)
433 AAA AW Bn

9th Infantry Division (In North Africa in Reserve)
Reported no lift available for AAA.

The AAA units were combat-assault loaded with the maximum number of weapons placed above deck in order to present concentrated AA fire points.

Beginning with the second assault wave, Self-propelled and MG (Airborne) units accompanied each wave, initial positions being along the beaches, with a depth of about 300 yards. As the towed and Self-propelled Field Artillery units moved inward, each sub-attached AA unit was diverted from vulnerable area defense to close-in vulnerable point defense of their primary objectives.

The barrage balloons were initially flown from the various landing craft during the early stages of unloading but were transferred to the beaches upon stabilization of the ground units. The 103 Barrage Balloon Battery was moved from CENT to JOSS on D-Day at request of the NAVY.

Although the aerial activity through D plus 12 was relatively light, except for the first three days, the AA units on beach and assault missions had over a hundred engagements, definitely destroying 18 planes in addition to preventing many others from accomplishing their assigned missions of bombing and strafing.

V. CHANGE OF DIRECTION - NORTH WEST

With the issuing of orders changing the direction of Seventh Army attack to the Northwest, it became apparent that Army would have to assume responsibility for AA defense of beaches, ports and airfields in the rear areas to free the Sub-Task Forces for forward movement.

Lacking a Brigade Headquarters, the 107th AA Group from II Corps was selected for the AA and CD defense of the Agrigento-Gela-Comiso areas. Specific VP's were indicated by Army Headquarters in the rear areas and in most cases specific units selected to defend them. All Sub-Task Force AA except SP Battalions was taken from the Sub-Task Forces and attached to the 107th Group for this purpose:

Attached 107th Group - South shore

107th AAA AW Bn
433rd AAA AW Bn
436th AAA AW Bn
400th AAA AW Bn (SM)
401st AAA Gun Bn
10 MG Batteries

VI. CHANGE OF DIRECTION – EAST

With the capture of Palermo, 22 July, and the cutting of highway 113, the rear area responsibility of the Army increased. The Commanding Officer, 62nd AAA Regiment, was charged with responsibility of AA and CD defence of Palermo and Boca di Falco airfield, and had the 105th AAA Group, with 2 Bns, attached. Two airfields were then opened at Termini Imerese, and the Commanding Officer, 105th AAA Group, was charged with the AA and CD defense of Termini Imerese harbor and nearby airfields. The attachments were as follows:

105th Group - Termini Imerese

214th Gun Bn
436th AAA AW Bn

62nd AAA Regiment - Palermo

2 batteries 401st AAA Gun Bn

107th Group - South Shore

401st AAA Gun Bn - 2 Batteries
400th AAA AW Bn (SM)
433rd AAA AW Bn
215th AAA Gun Bn
10 MG Batteries

II Corps

106th AAA Group
103rd AAA AW Bn
107th AAA AW Bn

1st Infantry Division

105th AAA AW Bn (SP)

3rd Infantry Division

443rd AAA AW Bn (SP)

45th Infantry Division

441st AAA AW Bn (SP)

2nd Armored Division

106th AAA AW Bn (SP)

With the arrival of the 34th AAA Brigade, 29 July 1943, the Commanding General, 34th Brigade was charged with responsibility for all AA and CD defense for the entire Seventh Army rear area. As additional AAA arrived they were assigned to areas according to priorities set up by XII Air Support Command for airfields and G-4 for ports and beaches, the latter being used along the north shore as the advance east continued.

When the 2626th Brigade arrived, 18 August 1943, the area of responsibility of the Seventh Army was split along a line running west from Enna to the west coast south of Marsala. Responsibility was given 34th Brigade for all VP's north of this line and 2626th Brigade for all VP's south of this line. The lack of AAA with II Corps was recognized by the attachment of certain units thereto. Shifting of units from Brigades to Corps took place as follows:

107th AAA AW Bn relieved from attachment to 107th AAA Group and attached to II Corps.

688th AAA MG Battery relieved from attachment to 107th AAA Group and attached to Headquarters Company, Seventh Army.

431st AAA AW Bn attached to II Corps.

694th and 695th AAA MG Battery (AB) relieved from attachment to 34th Brigade and attached to II Corps.

VII. D PLUS 38

Upon the completion of the Sicilian campaign in the Northwestern part of the Island around Messina, all of the AAA units with the exception of the 4 SP Bns, were relieved from Division attachment and attached to the two Army Brigades for ports, airfields, and other static defenses in the western half of Sicily.

VIII. RECAPITULATION

In Sicily	In Africa
2 Brigade Headquarters	0
5 Group Headquarters	1
2 Regt Headquarters	2
10 Gun Battalions	2
8 AW Battalions	7
4 SP Battalions	0
2 S/L Battalions	5
10 MG (AB) Batteries	0
2 BB Batteries	1

Reassignment of Army AA Units:

In preparing Fifth Army for a future operation the following units were released by Seventh Army on call:

2 Group Headquarters
2 Regt Headquarters
5 Gun Battalions
4 SP Battalions
7 AW Battalions
5 S/L Battalions
6 MG (AB) Batteries
2 BB Batteries (1 on loan only)

This left the following AAA units under Seventh Army for protection of one major port and 12 airfields:

2 Brigade Headquarters
4 Group Headquarters
2 Regt Headquarters
7 Gun Battalions
8 AW Battalions (2 still in North Africa 1 Sept)
3 S/L Battalions (1 still in North Africa 1 Sept)
4 MG (AB) Batteries
1 BB Battery

Rate of build up or estimated rate of arrival of units was based on an estimate of rate of advance of Sub-Task Forces and a balance between lift available and availability of units for shipment from North Africa. The following table is reproduced as the estimate that was first submitted.

The estimated rate of arrival as determined by the Sub-Task Force Commanders was as follows:

	Gp Hq	Regt Hq	AW Bn	SP Bn	90mm Gun Bn	S/L Bn	AB Btries	Total Bns
Cent - D to D plus 8	1	-	1	1	1	-	4	4
Dime - D	1	-	1	1	-	-	4	3
D plus 4	-	-	1/2	-	-	-	-	1/2
D plus 8	-	-	-	-	1	-	-	1
Joss - D	1	-	1	2	-	-	2	3 1/2
D plus 8	-	1	1	-	2	1	-	7
Kool	-	-	1/2	-	-	-	-	1/2
								19 1/2 Bns

D plus 14 and following, Force troops:

	Brig Hq	Gp Hq	Regt Hq	(By Bns) AW	Gun	S/L	Total Bns
D plus 14	1	1	-	3	1	1	5
D plus 18	-	-	-	1	-	-	1
D plus 22	-	-	1	2	1	2	5
D plus 30	-	1	-	-	2	1	3
D plus 45	1	-	1	1	2	1	4
D plus 60	-	1	1	-	2	2	4

Total Force Troops 2

Attached to Force Reserve:

Kool 1/2 AAA AW Bn.
9th Division 1 AAA AW Bn.

The actual rate of arrival agreed with the schedule set up with the exception that D plus 8 follow up brought those scheduled for D plus 4, successive arrivals being 4 to 8 days late

The arrival of Force troops was as follows; included are Sub-Task Force troops which were immediately placed under Army control:

	Brig Hq	Gp Hq	Regt Hq	SP Bn	AW Bn	Gun Bn	S/L Bn	AB Btry	Total Bns	Total Bns to date
D	-	3	-	4	4	1	-	10	11 1/2	11 1/2
D plus 8	-	-	1	-	1	2	-	-	3	14 1/2
D plus 10	-	-	-	-	-	1	-	-	1	15 1/2
D plus 20	1	-	-	-	-	-	-	-	-	-
D plus 28	-	-	-	-	-	1	1	-	1	16 1/2
D plus 31	-	1	1	-	2	3	1	-	7	23 1/2
D plus 36	1	-	-	-	-	2	-	-	-	25 1/2

Training: Initial training plans called for a course of instruction at Fifth Army Invasion Training Center (FAITC) plus a complete rehearsal of the planned landing by as many units as could be accomodated by the Center. This instruction was to include water proofing, loading on various craft and unloading.

Due to the amount of time required to work out various problems which appeared and also since so few units were available for amphibious training prior to the staging phase, only 4 AW Bns were given training prior to going to staging area. The Bns attached to Sub-Task Forces were given rehearsals with those Sub-Task Forces while the Army troops in general received little additional training. Water proofing alone was given each unit.

As far as amphibious training was concerned there seemed to be a lack of planning for getting towed guns off the beach during the assault phase. SP Guns came off in very good shape. Other phases of training are difficult to evaluate, but it is felt that units newly equipped with SP guns should have some target practice to familiarize themselves with the weapon. Also most AW Bns had had no firing since the close of the Tunisian Campaign or in some cases since the arrival from the states. Some Gun Bns had never fired with Radar Control. It is felt that if the caliber of the air opposition had been higher, less satisfactory results would have been obtained by the operation as a whole due to those deficiencies in training.

Recapitulation from D-Day to August 17 of firing at enemy planes:

	Total Rounds	Rounds Per Day	Total Planes	Rounds Per Plane
90mm	2037	50	5	407
40mm	13526	338	19	710
37mm	12243	308	24	510
50 cal.	241820	6040	2	-
			Total Planes - 50	

Above does not include 62 planes probably destroyed.

THIS PAGE IS UNCLASSIFIED

IX. CONCLUSIONS

In view of the lack of aerial activity, very few definite conclusions on AAA can be reached from the Sicilian Campaign. But the following are reasonable conclusions on amphibious operations, from this and the Torch Operation:

a. The relative Air Force strengths determine requirements of AAA.

b. No amount of Air Force can entirely eliminate enemy aerial activity.

c. With friendly air superiority, almost all gun targets will appear at night.

d. One SP or AW Bn cannot adequately protect a division. Two must be considered a minimum.

e. Field Artillery should have first priority in the division for AA defense as it has first priority for enemy air attack.

f. Overall first priority is shipping.

g. The question of attaching AAA to units defended or assigning missions has not been determined. Adequate AAA was not available to the Corps and Divisions to do more than protect field Artillery. The principle of assigning missions and keeping all under AAA control is considered correct.

X RECOMMENDATIONS

Allotment of AAA

The following are recommended allotments of AA:

Per Div - 1 Group Hq
2 AW Bns (1 SP)
1 Gun Bn

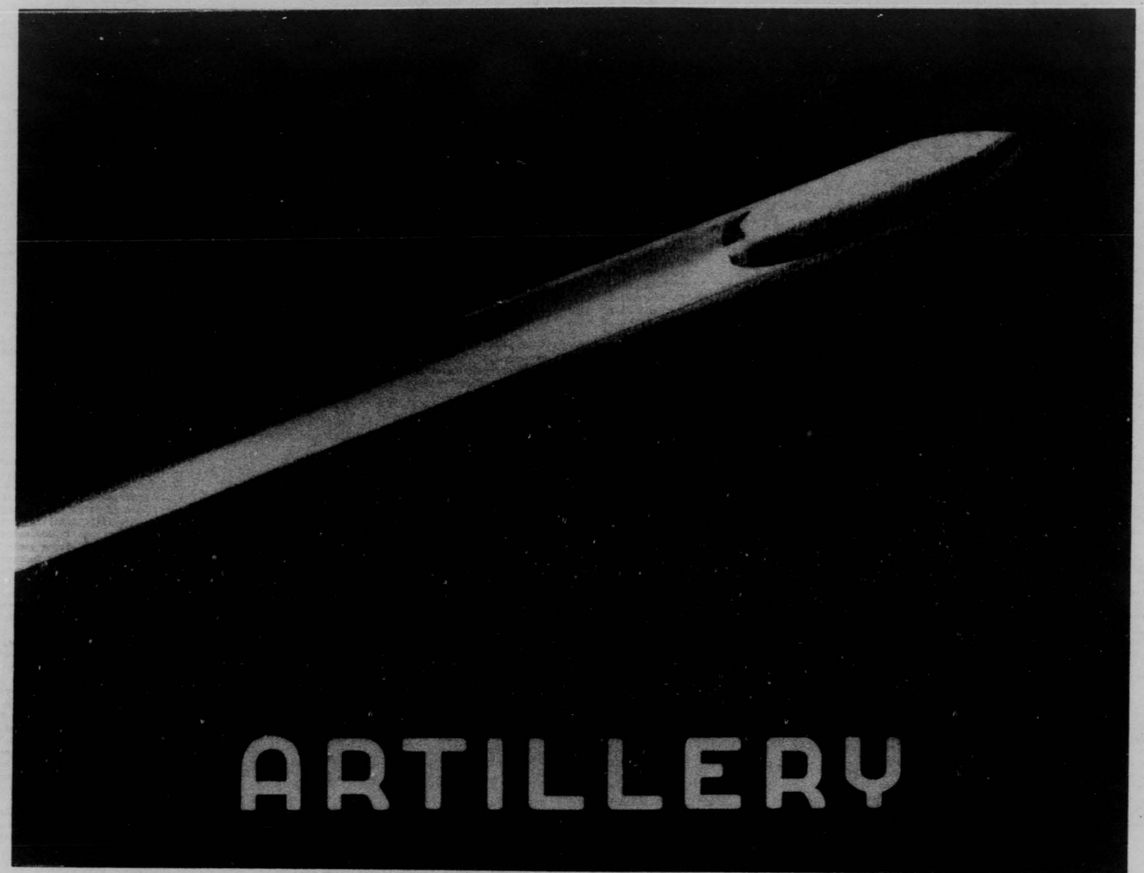
Armored FA Group - 1 AW SP Bn

Combat Command - 1 AW SP Bn

In the above no allowance is made for rear area installations including ports, rail yards, airfields, etc., which should be the direct responsibility of either Corps or Army for AA defense. The allotment of AAA to Corps will depend on the situation. It should not be less than one Group Headquarters with 2 AW Bns and 1 Gun Bn.

The AA and CD defense of all ports, airfields, rail heads, should be the responsibility of a Brigade or Brigades, under Army control.

A Liaison Officer from Air Headquarters should be present with the Army Air Support Command so the plans of all Air Force units can be known in advance.



Despite their constant employment, AAA units require training the same as any other units and plans for this must be continuous, expecially between operations.

AAA units with front line divisions require relief the same as the divisions do and replacement should be made to units available for this purpose.

M. B. THOMPSON,
Lieut Colonel, CAC,
Antiaircraft Officer.

REPORT OF THE ARTILLERY OFFICER

A. THE PLANNING PHASE

1. ARTILLERY SECTION:

At the beginning of the planning phase the Artillery Officer was also the Antiaircraft Officer and Anti-Tank Officer. He was assisted in the performance of these duties by the Assistant Antiaircraft Officer and Assistant Anti-Tank Officer. Tank units were also placed under the Artillery Officer. The Artillery Officer was responsible for the coordination of training of the Naval Shore Fire Control Parties and the preparation of the Naval Gun Fire Support Plan, Field Artillery Plan, Antiaircraft Plan and Coast Defense Plan for the operation.

The Artillery S-2 Section was responsible for the dissemination of intelligence matter and the preparation of S-2 estimates. Terrain studies of the beaches and adjacent terrain of the operation "HUSKY" were made from available documents and maps. This information was transferred in detail to overlays to the scale of 1/25,000 maps of the area. A Liaison Section of one officer and one enlisted man was established with the Photo Interpretation unit of Headquarters, I Armored Corps, Reinforced. A study was made of photo interpretation reports to evaluate targets of primary importance to subordinate Artillery units. Artillery targets were transferred to overlays to the scale of 1/25,000 maps of the area. A study of the organization, strength, and armament of German and Italian Field Artillery, Coast Artillery, Antiaircraft Artillery, and Anti-Tank Guns was made and distributed with the above mentioned data to subordinate Artillery units concerned with the operation. The Artillery S-2 Section was further charged with the distribution of special air photographs and mosaics required by artillery units.

The Artillery S-3 Section was primarily responsible for supervision of training of subordinate units. This was a difficult and delicate task, since most of the units were attached to Fifth Army training establishments for training. Therefore, frequent inspections were made to determine state of training and to give any possible assistance, but no training directives were issued and complete control was impossible. Arrangements were made to have as many units as possible take the amphibious, waterproofing, and transport quartermaster training at the Fifth Army Invasion Training Center. Also several tank destroyer battalions were attached to the Fifth Army Tank Destroyer Training Center for training. Records and charts were kept by the section showing location, strength, status of assignment and attachment, contemplated movements and sub-task force assignment of all field artillery, antiaircraft, tank destroyer and tank organizations which were to be in the operation. Assistance in obtaining bivouac areas and firing ranges was given to units, and the Artillery S-3 advised on necessary troop movements during the assembly of troops prior to the operation. The preparation of the Field Artillery and Antiaircraft annexes to the Field Order was done by the S-3 Section.

The Artillery S-4 Section was concerned primarily with giving all possible assistance to subordinate units in equipping themselves. Officers of this section made frequent visits to units to determine shortages and advise on securing necessary supplies and also kept in close touch with the supply agencies of the Base Sections. This assistance in securing supplies was especially valuable to newly-arrived organizations who were in need of much equipment and were unfamiliar with the supply proceedures in the African Theater. The S-4 was also concerned with ammunition supply plans and records.

A Counterbattery Section was established and organized in the Artillery Section, consisting of two officers and four enlisted men. The Counterbattery Officer was responsible for setting up a standard operating procedure for Counterbattery and the training of the section, none of whom, officers or enlisted men, had any previous counterbattery knowledge or experience. Counterbattery plans and orders were coordinated with the planning of the Sub-Task Forces. The Counterbattery Officer was also charged with the duty of coordinating Naval gunfire support with the Sub-Task Forces by means of Artillery Shore Fire Control Parties. The Section was prepared to function with Sub-Task Forces if so directed. An enemy battery file was maintained and coordinated with the Artillery S-2. Photo interpretation reports were studied for Counterbattery missions.

A letter to the Chief of Staff, I Armored Corps, Reinforced, 26 May 1943, requesting authority to organize an Air OP Section within the Artillery Section was approved. The Air OP Section was established with an authorized strength initially of two officers and eight enlisted men. The Artillery Air OP Section provided the necessary courier service between this Headquarters, Headquarters Sub-Task Forces and other subordinate units. The Artillery Air Section was responsible for maintaining accurate records of the strength and personnel assigned to the Artillery Air Sections of all subordinate units as well as the number and condition of airplanes and other air section equipment. The Air Section also coordinated the procurement of airplane parts and supplies for all subordinate units.

2. FIELD ARTILLERY:

Artillery units assigned to Headquarters Seventh Army for operation "HUSKY" were:

13th Field Artillery Brigade:
Headquarters and Headquarters Battery, 13th Field Artillery Brigade
17th Field Artillery (155mm Howitzer M1918 A3, truck-drawn)
178th Field Artillery (155mm Howitzer M1918 A3, truck-drawn)
36th Field Artillery (155mm Gun M1, tractor drawn)
1st Field Artillery Observation Battalion.
5th Armored Artillery Group:
58th Armored Field Artillery Battalion (105mm Howitzer M-7, SP)
62nd Armored Field Artillery Battalion (105mm Howitzer M-7, SP)
65th Armored Field Artillery Battalion (105mm Howitzer M-7, SP)
77th Field Artillery (Two battalions, 155mm Howitzer M1918 A3, truck-drawn).

The following additional Field Artillery units had been requested but were unavailable due to shortage of shipping:

18th Field Artillery Brigade (less 77th Field Artillery)
6th Armored Artillery Group
One Battalion Pack Artillery (less animals).

3. TANK DESTROYER:

Tank destroyer units assigned to Headquarters Seventh Army for the operation were:

1st Tank Destroyer Group:
Headquarters and Headquarters Company, 1st Tank Destroyer Group
776th Tank Destroyer Battalion
894th Tank Destroyer Battalion
899th Tank Destroyer Battalion
601st Tank Destroyer Battalion
645th Tank Destroyer Battalion.

4. TANK UNITS:

Tank units assigned to Headquarters Seventh Army for the operation were:
2nd Tank Group:
Headquarters and Headquarters Detachment, 2nd Tank Group
70th Tank Battalion (Light)
191st Tank Battalion (Medium)
753rd Tank Battalion (Medium)
757th Tank Battalion (Light)
756th Tank Battalion (Light)

5. ANTIAIRCRAFT:

In accordance with General Order #9, dated 31 July 1943, the Artillery Officer was relieved of his duties as Antiaircraft Officer and an Antiaircraft Officer was appointed effective 1 August 1943. A separate report of antiaircraft operation is being submitted by the Antiaircraft Officer.

B. THE OPERATION

1. FIELD ARTILLERY:

Beginning on D-Day, Field Artillery units were landed as follows:

"JOSS" Force (3d Infantry Division)

D - Day

62nd Armored Field Artillery Battalion.
1st Battalion (less one battery), 77th Field Artillery.
Battery "A", 36th Field Artillery.
Battery "B", 1st Field Artillery Observation Battalion.

D + 4

Detachment from Headquarters, 36th Field Artillery.
1st Battalion (less Battery "A"), 36th Field Artillery.
Headquarters 5th Armored Artillery Group.
58th Armored Field Artillery Battalion.
65th Armored Field Artillery Battalion.
Remainder 77th Field Artillery.

"SHARK" Force (II Corps)

"DIME" Force (1st Infantry Division)

D - Day

Battery "A", 1st Field Artillery Observation Battalion (plus detachment, Headquarters Battery).

D + 4

17th Field Artillery.
Battery "F", 36th Field Artillery.

"CENT" Force (45th Infantry Division)

D - Day

Battery "D", 36th Field Artillery

D / 4

1st Battalion, 178th Field Artillery.
Battery "E", 36th Field Artillery.

Headquarters and Headquarters Battery (less detachment), and 2nd Battalion, 36th Field Artillery, (less "D", "E", and "F" Batteries) arrived in Sicily 2 August 1943.

Headquarters and Headquarters Battery, 13th Field Artillery Brigade, arrived in PALERMO, SICILY, 13 August 1943.

178th Field Artillery (less 1st Battalion), and Headquarters and Headquarters Battery, 1st Field Artillery Observation Battalion (less detachment) remained in North Africa.

The D - Day landings of Field Artillery units was successful at all beaches. Notable features in the landings were as follows:

The feasibility of landing light, medium and heavy Field Artillery weapons early in the assault was proven. This filled a long-felt need, since early support was made available to the assault troops, saving the heavy casualties formerly associated with landings by unsupported Infantry. It was made possible by modern landing craft which made it unnecessary to wait for the capture of a port before landing heavy materiel.

The 105mm Howitzer M-7 (SP) proved a superior vehicle for landing operations. It was debarked in much as six feet of water and was able to come ashore under its own power. Being able to fire at any time, without the delay of going into position, it furnished immediate support as soon as it reached the beach. Its operation over soft sand was excellent, except that operation parallel to the water-line was not feasible, since sand worked into the tracks and threw them. The 3d Infantry Division Artillery, which had had previous training with armored artillery weapons, made excellent use of the M-7's of the attached 5th Armored Artillery Group, exchanging the towed guns of the Divisional light battalions for them. This enabled them to gain the advantage of the M-7 as a landing vehicle without disrupting the Regimental Combat Team organization by substituting a strange armored battalion for the organic Combat Team Artillery. The armored battalions came ashore with the towed howitzers of the Division and the weapons were exchanged as combat conditions permitted.

On D / 5, the 1st Battalion of the 77th Field Artillery and the 62nd Armored Field Artillery Battalion were relieved from attachment to the 3d Infantry Division and attached to the 82nd Airborne Division, which moved to the west on MARSALA and TRAPANI. The remaining Field Artillery units continued with the 3d Infantry Division in its attack northward on PALERMO.

On D / 21, PALERMO and the western end of the island having fallen, all attached Field Artillery with the Provisional Corps was released and attached to II Corps for the operations directed upon MESSINA. These units (1st Battalion 36th Field Artillery, 5th Armored Artillery Group and 77th Field Artillery) moved east and joined II Corps in the vicinity of ALIA. They were employed, with the remainder of the 13th Field Artillery Brigade, to support the advance of II Corps in its attack. The very heavy concentration of Field Artillery was an outstanding feature in the taking of the strong enemy position at TROINA. Also, the 58th Armored Field Artillery Battalion (at reduced strength, employing two four-gun batteries) participated in two amphibious operations of units of the 3d Division which made landings behind the enemy lines along the north coast of the island. On the second of these the eight M-7's of the 58th Battalion were instrumental in stopping a tank attack which threatened the entire landing force. In this operation the Battalion lost seven of its M-7's (the eighth one was damaged) and the men continued the fight as Infantry.

A Photo Liaison Section consisting of an officer pilot and an enlisted man was attached to the Photo Interpretation Unit of Seventh Army for the operation. Its mission was to secure Field Artillery information from air photograph interpretation and to forward this information directly to artillery units. It also received requests for special Artillery missions and transmitted them directly to the Photographic Squadron. During the early stages of the operation this unit was based at LA MARSA, TUNISIA. On D + 8 an advanced detachment (including the officer of the Photo Liaison Section) arrived in SICILY and established headquarters at PONTE OLIVIO airport. On D + 13 the remainder of the unit arrived in SICILY. Photos and photo interpretation reports were flown by the officer pilot to II Corps. A total of thirty-eight missions was accomplished. This service proved invaluable in the dissemination of vital artillery information, especially the locations of hostile batteries.

The Artillery Air OP Section was used extensively during the operation to provide air courier and passenger service. The Air Section frequently flew the Commanding General and his staff on missions incident to the operation.

2. TANK DESTROYER:

All Tank Destroyer units were held under Seventh Army control. The 601st and 645th Tank Destroyer Battalions were ordered to be prepared to move to SICILY on four hours notice at any time after D + 4. The remaining Tank Destroyer units were to be moved subsequently as need for them was forseen and craft were available. As the operation progressed, no employment was forseen for the Tank Destroyer units of sufficient importance to justify the diversion of craft for their movement. Therefore no Tank Destroyer units were brought to SICILY at any time during the operation.

3. Tank Units:

The 70th Tank Battalion (L) was attached to the 1st Infantry Division for the landing and was landed on D - Day with the "DIME" force. It subsequently was relieved from this attachment and was attached to II Corps, in which role it fought throughout the campaign. The 753rd Tank Battalion (Medium) was attached to the 3rd Infantry Division, landed with the "JOSS" Force on D - Day, and remained with this force until D + 21, at which time it was relieved and attached to II Corps. Elements of the Battalion participated in amphibious landings behind the enemy lines on the north coast with units of the 3rd and 45th Infantry Divisions. The other tank units were held in AFRICA on call; however, since no necessity for their employment arose, they were never sent to SICILY.

CONCLUSIONS

1. Probably the outstanding lesson for Field Artillery was the feasibility of landing craft, medium and heavy artillery materiel early in an assault, from modern landing craft. The 105mm Howitzer M7 (SP) proved to be one of the best non-amphibian landing vehicles of any arm. This vehicle was debarked in as much as six feet of water, but came ashore under its own power without difficulty. It was found that on a soft sloping beach, operation must be perpendicular to the water-line since travel parallel to water-line causes a thrown track due to sand banking up inside the track. Other types of Field Artillery materiel landed successfully on D-Day included the 105mm Howitzer M2 (towed), 155mm Howitzer M1918 A3, 155mm Howitzer M1 and 155mm Gun M1.

2. The 105mm Howitzer M7 can be fired with fair accuracy from the deck of an LCT prior to the grounding of the craft.

3. When the 105mm Howitzer M7 is employed, heavy supply and maintenance requirements must be planned for, since frequent repairs and parts are needed.

4. It is again emphasized that integrity of Field Artillery units must be maintained in order to secure the most effective fire support. When decentralization is necessary, units should revert to centralized control at the earliest possible time.

5. Survey must always be instituted in every position, even when good maps are available.

6. The Artillery Air OP has fully proven its effectiveness. Communication difficulties were encountered due to the short range of the SCR-610. A longer-range is needed.

7. Steps must be taken to reduce the shine of the fore part of the barrel of the 155mm Howitzer M1, since positions are revealed by the reflected light.

8. Better machining and finishing of the parts of the breech-block and firing mechanism of the 155mm Howitzer M1 are needed to prevent jamming and malfunctioning.

9. Both the 4-ton and 6-ton trucks have proved inadequate as prime movers for the 155mm Howitzer M1.

10. A stronger limber-lifting screw must be provided for the 155mm Gun M1.

11. Principles of Tactics and Technique of Field Artillery, as taught by Field Artillery School, have again proved sound.

RECOMMENDATIONS

1. That the utmost care be exercised to insure that only uniform lot numbers on projectiles, powder charges and fuses be issued. This is essential to effective firing.

2. White Phosporous smoke shell, which is to be replaced as a screening agent by the new HC-Base Ejection Smoke Shell, should not be completely withdrawn, since it has proved to have excellent casualty and incendiary effects, and has a very strong morale effect on the enemy. This last was testified to repeatedly by prisoners. It is therefore recommended that both HC-BE and WP continue to be provided for artillery units. Recommended percentages (of total smoke) are: HC-BE - 80%, WP - 20%.

3. Extensive enemy use of land mines in defensive and delaying operations has made it essential that Field Artillery units be equipped with mine detectors to avoid heavy personnel and material losses when occupying positions. Engineer personnel is normally not available for this purpose, since road clearance and other missions have a higher priority than clearing artillery position areas. Authority has been secured from SOS NATOUSA for the issue of mine detectors to field artillery units in this theater on the basis of one per headquarters battery and three per firing battery. It is recommended that Tables of Equipment be modified to allow these mine detectors for all field artillery units (including especially those in the US) to permit necessary training of artillery personnel in their use.

4. All artillery units agree on the desirability of longer range for artillery weapons. Since we have seen frequently out-ranged by German medium and heavy guns, longer-range materiel is needed for counterbattery.

5. It is essential that time shell furnished for the 155mm Howitzer be fused with the M67 fuse.

6. Elimination by rigid Ordnance inspection of all artillery weapons which do not have an expectancy of serviceability beyond the immediate campaign in prospect should be accomplished from both units and replacement stocks prior to shipment from staging area.

7. The training of more highly-specialized air photograph interpreters in division and higher photo interpretation units is essential to provide artillery units with proper photo interpretation.

/s/ John M. Willems
JOHN M. WILLEMS,
Colonel, Field Artillery,
Artillery Officer.

AIR ANNEX TO ARTILLERY REPORT

1. Changes in organic equipment, duties of personnel, and tactics of employment of the artillery air sections have gradually taken place within combat units as a result of operations in Tunisia and Sicily. So that these changes resulting from battle experience could be recorded and recommendations for changes in existing tables of organization and tables of equipment based upon practical knowledge could be formulated, a conference of combat experienced division, group, corps, and army artillery air officers was held at Palermo, Sicily, on September 3, 1943, attended by officers from the following units:

Seventh Army Artillery Air Officer (Sicily)
II Corps Artillery Air Officer (Tunisia and Sicily)
2nd Armored Division Artillery Air Officer (Sicily)
1st Infantry Division Artillery Air Officer (Tunisia and Sicily)
3rd Infantry Division Artillery Air Officer (Sicily)
9th Infantry Division Artillery Air Officer (Tunisia and Sicily)
45th Infantry Division Artillery Air Officer (Tunisia and Sicily)
5th Field Artillery Group Air Officer (Tunisia and Sicily).

The following are the lessons learned by these artillery air officers and their recommendations for necessary modifications in the present artillery air sections.

2. Lessons Learned:

a. Tactics.

(1) In the artillery battalion the principle of organic air observation has proven to be sound. The successful adjustment of artillery fire from the air is dependent upon teamwork built up between pilot, observer, and the artillery battalion as a result of intensive training together. Only one airplane has been required by the battalion. The reserve plane was rarely used by the battalion.

(2) The division artillery air sections used their two organic airplanes for adjusting artillery fire of the division, but it was also found in combat that numerous vital reconnaissance and liaison missions for the division other than artillery observation were demanded of the liaison airplanes in the division artillery section. Therefore, their airplanes were employed more for vital reconnaissance missions for both the division artillery and the division than for observation of division artillery fire. More missions were required than the two organic airplanes could possibly fly. All the division artillery commanders employed the reserve planes of the battalions at the division artillery field in order to accomplish the additional missions required and until airplanes are issued to the other arms and services for this reconnaissance employment it is necessary that no reduction be made in the total number of airplanes already assigned to the division artillery and to the artillery battalions.

(3) The group artillery air sections employed their airplanes in the same manner as division artillery commanders, using the battalion reserve planes at the group artillery field for additional reconnaissance and fire missions for the group artillery.

(4) The corps artillery air section did not adjust corps artillery fire because the radio communication was inadequate and because the Cub and Aeronca airplanes available were not capable of accomplishing that mission which would require flying several miles behind enemy front lines to observe corps artillery targets. No night flights were attempted because neither the Cub nor the Aeronca are suitable or equipped for this type of flying. However many vital reconnaissance missions were flown for the corps commander and the corps artillery commander.

(5) The army artillery air section did not adjust any artillery fire. However, several vital reconnaissance missions were flown for the army commander and his staff. The air section also flew a great number of important courier missions for all the staff sections of the army headquarters.

b. Technique.

(1) Forward observation methods of adjusting artillery fire from the air as now taught at the Field Artillery School have proven to be quick, efficient and sound.

(2) The technique of flying while observing fire conceived and taught at the Field Artillery School is not practical. Observation cannot be obtained by flying a few hundred feet over the battery position and adjusting the fire of that battery upon targets three or four thousand yards away because the targets cannot be seen from that distance and because our front lines and the enemy front lines are always indistinct and difficult to locate even when flying directly over them.

(3) It has been found necessary to fly up to and over the enemy front lines from altitudes of 500 feet up to 3000 feet in order to obtain observation required to accomplish the mission. Even then the observer had to have binoculars to locate the target. In many cases flights were made about one thousand yards off shore at an altitude of two thousand feet in order to adjust our artillery fire upon enemy targets several miles behind the enemy front lines, which adjustment by any other means would have been impossible due to terrain obstacles.

c. Communication.

(1) In general the 610 radio installed in the airplane has not been satisfactory because of its weight and its short range. A lighter radio of much longer range is required. This is especially true in medium and heavy artillery battalions.

(2) It was found necessary to provide additional radio communication for the artillery air section. A 610 radio installed in a 1/4 ton truck was used for ground reconnaissance communication and for liaison between the artillery command post and the battalion airfield. Another 610 radio installed on the 3/4 ton weapons carrier was necessary to communicate with the airplane while in the air and with the reconnaissance 1/4 ton truck.

(3) In order to maintain communication between the division artillery command post and the division artillery airfield a 193 radio was provided at the airfield to operate on the division artillery command channel. This radio was absolutely necessary because of the distance between the airfield and the command post and the lack of adequate wire communication. Two additional 608 or 610 radios installed on 1/4 ton trucks were necessary for liaison and ground reconnaissance purposes.

(4) A radio having increased range is vitally needed by the corps artillery airplanes. No missions were flown for either adjustment or surveillance of corps artillery fire because the 610 radio was inadequate. Two 610 or 608 radios installed in 1/4 ton trucks were also necessary to maintain communication between the artillery command post and the airfield and for ground reconnaissance missions.

(5) No radio communication was necessary for the airplanes of the army artillery section, or for ground reconnaissance and liaison.

d. Materiel.

(1) Airplanes.

(a) One airplane is sufficient for the battalion air section. The reserve plane was nearly always attached to the division artillery air section.

(b) The two organic airplanes and the three reserve planes of the battalions are sufficient to accomplish all group artillery missions.

(c) The two organic airplanes and the four reserve airplanes of the battalions are sufficient for the division artillery to accomplish all its missions.

(d) Four airplanes are required to fulfill the corps artillery missions.

(e) Eight airplanes were required for the army missions. The army section should also maintain a pool of about 20% reserve pilots and airplanes in order to provide rapid replacement for pilots and airplanes lost by the divisions in combat. While these pilots and planes are in reserve they could be used to fly the many courier missions for the army headquarters.

(f) In general the Aeronca (L-3-C) is not suitable for combat. The Cub (L-4-B) is barely satisfactory, but does not have sufficient power, performance, or weight carrying capacity to efficiently and safely accomplish combat missions. Because of this lack of power and light construction many minor crack-ups have occurred on the rough, short, and difficult fields encountered in Tunisia and Sicily. An airplane having increased horsepower, better performance, more speed, more rugged construction, and having luminous and accurate instruments is vitally needed. Both the Stinson (L-5) and the Interstate (L-16) airplanes incorporate these improved features.

SECRET

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

(2) Transportation.

(a) The battalion air section has found that an additional 1/4 ton truck is necessary for ground reconnaissance and liaison with the battalion command post. The half-track in the armored battalion air section does not have sufficient cargo capacity to carry all the section and individual equipment.

(b) The group artillery air section has found that three 1/4 ton trucks are necessary for reconnaissance, liaison, and radio communication. Three additional 3/4 ton weapons carriers and three 1/4 ton trailers are necessary to supply the battalion reserve planes attached to group headquarters and to carry kitchen equipment.

(c) The division artillery air section has found that three 1/4 ton trucks are necessary for reconnaissance, liaison, and radio communication. Two additional 3/4 ton weapons carriers and two 1/4 ton trailers are necessary to supply the four battalion reserve airplanes at the division artillery airfield. An additional 3/4 ton weapons carrier and 1/4 ton trailer are necessary to carry the air section kitchen equipment.

(d) The Corps artillery air section requires two 1/4 ton trucks for liaison and ground reconnaissance. Two 3/4 ton trucks and two 1/4 ton trailers are required to supply the four airplanes. One additional 3/4 ton truck and one 1/4 ton trailer are necessary to transport kitchen equipment. Three 2½ ton trucks with 1 ton trailers are necessary to transport section equipment, replacement spare parts, and supplies for the divisions. Another 2½ ton truck and trailer are necessary to recover and repair cracked-up airplanes for the divisions.

(e) The army artillery air section requires two 1/4 ton trucks for liaison and ground reconnaissance. One 3/4 ton weapons carrier and one 1/4 ton trailer are necessary to carry equipment for each two airplanes assigned to the army section. One 2½ ton truck with one 1 ton trailer is sufficient to carry the spare parts and equipment of the section . One additional 3/4 ton weapons carrier with a 1/4 ton trailer is necessary to haul kitchen equipment.

(3) General equipment.

(a) Each battalion, group, division, and corps artillery air section has found that observers must have binoculars.

(b) All air sections have found that kitchen equipment is absolutely necessary.

e. Personnel.

(1) Officer pilots have proven far superior to enlisted pilots because they are more dependable, better educated and more experienced in artillery.

(2) Officer observers who have been previously trained by their units have fired missions in a superior manner. Observers who have not been previously trained failed to accomplish their missions many times because they were not used to flying and were therefore unable to orient themselves, find the bursts, or locate the targets, and they were often too air sick, too inexperienced or too scared to even operate the radio satisfactorily. This necessitated the employment of officer pilots as observers in the battalions where the observers had not been previously trained. Regularly assigned observers should and can draw flying pay under the provisions of a War Department order dated August 5, 1943.

(3) Mechanics have been superior. They have been well trained by the Field Artillery School and much credit is due them for the performance of all the field artillery airplanes.

(4) New pilots have lacked cross country experience and have become lost on several occasions in Africa and Sicily as a result. Most of the enlisted pilot replacements are unable to read maps satisfactorily.

(5) No field artillery personnel has been seriously injured or killed in the Sicilian campaign as a result of airplane accidents. However, an air corps pilot, accustomed to flying heavy airplanes, crashed a commandeered Aeronca in the mountains of Sicily and was instantly killed.

(6) Three combat experienced air officers should be ordered to the Field Artillery School under the principle of rotation of key officers in order to explain to the school the problems encountered in combat and to help the school adjust its training to prepare pilots and mechanics for actual combat conditions based on experience rather than on theory. These officers should also become corps artillery air officers of units expecting to go overseas in order to properly train and equip the artillery air sections for combat.

f. Enemy action.

(1) Our planes have been attacked on nine different occasions by several enemy aircraft, but none were shot down. Standard evasive measures of rapid descent, contour flying, and weaving have been successful.

(2) Our planes were often attacked by antiaircraft and rifle fire, but none were shot down. Again standard evasive measures were successful in avoiding most of the fire. An airplane having increased speed and greater performance is needed to avoid antiaircraft fire when flying at low altitudes.

(3) Most of our success in the use of liaison airplanes is due to our air superiority. If the enemy should ever equal our air power or obtain air superiority a high percentage of losses of personnel and airplanes must be expected.

g. Supply.

(1) The supply of essential spare parts has been completely inadequate. No system of automatic supply of essential items of air corps equipment has yet been developed. Cubs and Aeroncas continually require many spare parts for dependable operation because they are not designed for rough combat conditions.

3. Upon the basis of these lessons learned in combat, the following tables of organization and tables of equipment for the air section of battalion, division, group, corps, and army are recommended:

Artillery Battalion Air Section

PERSONNEL	MAJOR ITEMS OF EQUIPMENT
1 1st Lt., Bn. Air Off., Pilot	1 Airplane, Liaison
1 2nd Lt., Asst., Bn. Air Off., Pilot	1 Truck, 3/4 ton, WC, w/w
1 2nd Lt., Observer	1 Truck, 1/4 ton, 4 x 4
1 T/3, Mechanic	1 Trailer, 1/4 ton
1 T/5 Mechanics assistant	1 Gun, machine , cal .50 w/mount
1 T/5 Chauffeur	2 Binoculars, pr.
	1 Radio, SCR 619 (airplane)
	2 Radios, SCR 610
	1 Mine detector
	1 Stove, for field range
	Sufficient equipment to maintain one airplane

Group Artillery, and Armored Division Artillery Air Section

PERSONNEL	MAJOR ITEMS OF EQUIPMENT
1 Captain, Arty Air Off., Pilot	5 Airplanes, Liaison
1 1st Lt., Eng Off, Pilot	1 Truck, 2½ ton, lwb, w/w
5 2nd Lts., Pilots	4 Trucks, 3/4 ton, W/C, w/w
1 2nd Lt., Observer	3 Trucks, 1/4 ton, 4 x 4
1 M/Sgt, Chief of Section	1 Trailer, 1 ton
1 Tech Sgt. Supply, Mechanic	5 Trailers, 1/4 ton
3 T/3 Mechanics (one per 2 ap)	3 Guns, machine cal .50
3 T/5 Mechanics, assistant (one per 2 ap)	2 Binoculars, pr.
1 T/3 Radio technician	1 Mine detector
3 T/5 Radio operators	5 Radios, SCR 619, one per ap
1 T/4 Cook	2 Radios, SCR 608
1 Basic, cook's helper	1 Radio, SCR 193
7 T/5 Chauffeurs	1 Kit, radio repair and tuning
	1 Range, field, complete
	2 Mess chests, officers
	1 Tent, CP complete w/pins and poles
	2 Tents, wall, large, complete w/flys, pins and poles
	Sufficient equipment to maintain five airplanes already authorised

Infantry or Motorised Division Artillery Air Section

PERSONNEL	MAJOR ITEMS OF EQUIPMENT
1 Captain, Div Arty Air Off., Pilot	6 Airplanes, Liaison
1 1st Lt., Div Arty Eng Off., Pilot	1 Truck, 2½ ton, lwb, w/w
6 Lts., Pilots	4 Trucks, 3/4 ton, W/C, w/w
1 Lt., Observer	3 Trucks, 1/4 ton, 4 x 4
1 M/Sgt., Chief of Section	1 Trailer, 1/4 ton, 4 x 4
1 Tech Sgt., Supply Sgt.	5 Trailers, 1/4 ton
3 T/3 Mechanics (one per 2 ap)	3 Guns, machine, cal .50 w/mounts
3 T/5 Mechanics, assistant (one per 2 ap)	2 Binoculars, pr.
1 T/3 Radio technician	1 Mine detector
3 T/5 Radio operators	6 Radios, SCR 619, one per ap
1 T/4 Cook	2 Radios, SCR 608
1 Basic, Cooks helper	1 Radio, SCR 193
7 T/5 Chauffeurs	1 Radio repair and tuning kit
	1 Field Range, complete
	2 Mess Chests, officers
	1 Tent, CP, complete w/pins poles
	Sufficient equipment to maintain six (6) airplanes.

Corps Artillery Air Section

PERSONNEL	MAJOR ITEMS OF EQUIPMENT
1 Major, Corps Arty Air Off., Pilot	4 Airplanes, Liaison
1 Captain, Corps Arty Eng Off., Pilot	4 Trucks, 2½ ton, lwb, w/w
4 Lts., Pilots	2 Trucks, 1/4 ton, 4x4
1 M/Sgt, Chief of Section	4 Trailers, 1 ton, cargo
1 Tech Sgt., Supply	3 Trucks, 3/4 ton 4 x 4 W/C
1 Tech Sgt, Repair	3 Trailers, 1/4 ton
4 T/3 Mechanics	2 Guns, machine, cal .50
4 T/5 Mechanics assistants	2 Binoculars, pr.
1 T/4 Cook	1 Mine detector
1 Basic, cook's helper	4 Radios, SCR 619, one per ap
2 T/5 Radio operator	2 Radios, SCR 608
9 T/5 Chauffeurs	1 Range, Field, complete
	1 Mess Chest, officers
	1 Tent, CP, complete w/pins and poles
	2 Tents, Wall, large, complete w/flys, pins and poles
	Sufficient equipment to maintain four airplanes already authorised by T/BA. Also extensive third echelon repair equipment.

The mission of this section is to provide artillery air observation for corps artillery fire, air reconnaissance for the corps commander, supplies for the division air sections, and third echelon repairs and maintenance for all the airplanes in the corps.

Army Artillery Air Section
(Organic)

PERSONNEL	MAJOR ITEMS OF EQUIPMENT
1 Major, Army Arty Air Off., Pilot	8 Airplanes, Liaison
1 Captain, Army Arty Supply Off., Pilot	1 Truck, 2½ ton, w/w
1 Captain, Army Arty Operations Off., Pilot	5 Trucks, 3/4 ton, 4 x 4
8 Lts., Pilots	2 Trucks, 1/4 ton, 4 x 4
1 M/Sgt., Chief of Section	1 Trailer, 1 ton
1 Tech Sgt., Supply	5 Trailers, 1/4 ton
4 T/3 Mechanics	3 Guns, machine, cal .50
4 T/5 Mechanics assistants	2 Binoculars, pr.
1 T/4 Cook	1 Mine detector
1 Basic, cook's helper	8 Radios, SCR 619, one per ap
8 T/5 Chauffeurs	1 Range, Field, complete
	2 Mess Chests, officers
	1 Tent, CP, complete w/pins and poles
	2 Tents, wall, large, complete w/flys, pins, and poles
	Equipment to maintain eight (8) airplanes.

(Replacement Pool)

20 Lieutenants, Pilots	20 Airplanes, Liaison
10 T/3 Mechanics	10 Trucks, 3/4 ton, 4 x 4, W/C
10 T/5 Mechanics assistants	2 Trucks, 2½ ton, w/w
12 T/5 Chauffeurs	10 Trailers, 1/4 ton
	2 Trailers, 1 ton
	2 Mess Chests, officers
	20 Radios, SCR 619, one per ap
	Equipment to maintain ten (10) airplanes.

The mission of the army artillery air section is to provide essential reconnaissance for the army commander and the army artillery commander, and to provide a 20% replacement pool of reserve pilots, mechanics, and airplanes for a total of one hundred (100) airplanes already assigned to the division, corps, and army artillery units in combat while flying courier missions for army headquarters.

TACTICAL OPERATIONS

PLANNING PHASE

During the planning stage of Operation Husky, the Chemical Officer, Force 343 (Seventh Army) faced three separate problems. (1) the employment of CWS troops; (2) Preparations for the Protection Against Chemical Attack of the Task Force; (3) Preparations for the employment of CWS munitions by all arms.

Employment of CWS Troops

Before decisions could be made relative to the employment of CWS units, these units had to be made available to the Force. In March arrangements were made which culminated in the movement of the 3rd, 83rd, and 84th Chemical Battalions (Mtz) from the United States to North Africa, and their assignment to the Force. The 2nd Chemical Battalion (Mtz) was scheduled to continue training in the States and sail later with the 45th Division. At the same time, the 69th and 78th Chemical Smoke Generator Companies, the 21st Chemical Decontaminating Company, the 12th Chemical Maintenance Company and the 63rd Chemical Depot Company, already in the North African Theatre of Operations, were earmarked for assignment to the Force. Of these units, the 21st Chemical Decontaminating Company was the only one that had been under the control of I Armored Corps, prior to the preparations for Operation Husky. The 12th Chemical Maintenance Company was assigned to Atlantic Base Section. The 69th Chemical Smoke Generator Company was assigned to Eastern Base Section. The 78th Chemical Smoke Generator Company was assigned to Headquarters Command, Allied Force Headquarters. These assignments and attachments were left undisturbed until it was actually necessary to move units into staging and mounting areas.

The 3rd, 83rd and 84th Chemical Battalions (Mtz) did not arrive in North Africa until 8 May - two months prior to D-Day. The procedure of staging and receiving organizational equipment consumed three weeks to a month. Thus, the battalions were not in a position to begin working with the divisions to which they were to be attached until 5 weeks prior to D-Day. As soon as each battalion was released from the Mediterranean Base Section Staging Area, it was attached to a Division and moved to the proper division area.

The 3rd Chemical Battalion (Mtz) was attached to the 3rd Infantry Division and moved overland by organic motor transportation to the vicinity of Bizerte. The 83rd Chemical Battalion (Mtz) was attached to the 1st Infantry Division and moved to the vicinity of Clemencecau, Algeria. The 84th Chemical Battalion (Mtz) was attached to the 9th Infantry Division and was moved to the vicinity of Nagente, Algeria. However, by this time, each of these divisions was preoccupied with the problem of re-equipping, of preparing Unit Alert Plans, of packing equipment, and of deploying subordinate units for embarkation. One company of the 83rd Chemical Battalion (Mtz) no sooner arrived in the 1st Infantry Division area than it was immediately moved again to join the 1st Ranger Battalion, 100 miles to the West.

Because of the late date on which the Chemical Weapons Battalions joined their respective divisions, there was little opportunity for combined training and for instructing Infantry regimental and battalion commanders and their staffs of the capabilities and limitations of the 4.2" morter. This was unfortunate - because it was, in effect, a new weapon, with which no infantry personnel in the North African Theater had had any experience.

At the time of the arrival of the Chemical Battalions (Mtz) in North Africa, only one of these battalions, the 3rd, had had any previous amphibious training. It had been hoped that it would be possible to fit the 83rd and 84th Chemical Battalions (Mtz) into the training program at the Fifth Army Invasion Training Center. Because of the time element, these battalions received only sketchy preparation for the problems of amphibious maneuver.

In the meantime, the Chemical Officer, Force 343 (Seventh Army) and the Chemical Officer, Force 141 (Fifteenth Army Group) were in frequent contact with the staffs of the divisions to which chemical battalions were attached. The object of this liaison was to familiarize division staffs with the correct employment of Chemical Battalions (Mtz). Particular stress was given to the possibilities of employing 4.2" morters to cover the assault landings, using techniques recently developed and perfected in the Amphibious Training Center in the United States.

While it was not possible to subject the Chemical Battalions to adequate amphibious training, opportunities for general training during the pre-invasion period were, nevertheless, not overlooked. Each of the battalions had been prevented from participating in training exercises for a considerable length of time, during which it had been alerted at its home station in the U. S., packed its equipment, moved to a staging area, embarked for overseas and been immobilized in the Mediterranean Base Section staging area in North Africa. Therefore, a request for a training allowance of 30 rounds per morter was requested from NATOUSA and approved. This was triple the amount that would have been available to the Battalions under existing allowances and provided an excellent opportunity to give all personnel intensive training in reconnaissance, selection and occupation of position, fire direction, and service of the piece.

Thus, the Chemical Battalions were able to embark, with personnel in good physical condition and with all men thoroughly familiar with their weapon. The only exceptions to this were replacement personnel - both officers and enlisted men, who joined the battalions from Replacement Pools just prior to embarkation, without adequate previous experience with the 4.2" morter.

During the period of training firing, a large percentage of defective White-Phosphorus-filled 4.2-inch shell was discovered. Investigation revealed that a portion of this ammunition had been loaded on transatlantic transports - in the bilges, and that, due to lack of a waterproofed package, the shell fuses had corroded. Arrangements were immediately concluded with SOS NATOUSA to inspect all 4.2-inch shell in Africa, to segregate defective rounds to improvise waterproofing for ammunition earmarked for the operation.

The 2nd Chemical Battalion (Mtz) arrived in Africa, combat loaded, with the 45th Infantry Division, to which it was attached on 25 June 1943. This battalion had undergone thorough amphibious training in the United States and had been fortunate enough to experience combined training with the Infantry units, which it would support during the operation.

CWS Service Units

During this phase, the CWS service companies that were to form part of the Force continued their activities, under the control of the commands to which they were attached. Commanding Officers of these units were ordered to report for instructions to the Corps or Division headquarters, under which they were to serve during the operation. In addition all these service units were contacted by the Chemical Officer or Assistant Chemical Officer, Force 343(Seventh Army) and oriented as to their future employment. The maintenance of the status quo, as far as service units were concerned, allowed SOS NATOUSA to make its supply dispositions with a minimum of disruption and, at the same time, allowed the units to gain experience in the same type work which they were to perform in Sicily. As the time approached for embarkation, and as the need for them to perform duties relative to the operation became apparent, the units were relieved of attachment to various commands and moved to proper staging and mounting areas. The 69th and 78th Chemical Smoke Generator Companies moved to Bizerte and provided effective area smoke operations over that port during the critical embarkation period.

Preparations for the Defense Against Chemical Attack.

Intelligence reports from Sicily revealed very little likelihood of the use of toxic chemical agents by the enemy during the operation. Nevertheless, certain measures were taken to prepare the Force for any eventuality. A series of Army Chemical Warfare Schools, to qualify as many unit gas officers and non-commissioned officers as possible for Division, Corps, and Army troops were conducted by Chemical Officer, II Corps. Similar schools were conducted in the Divisions. All units were equipped with full T/BA protective equipment. Because of experience in previous operations, in which it had been found that the Service Gas Mask was too heavy for assault forces, arrangements had been made to equip all personnel in the assault convoy with training type gas masks.

Preparations for the Employment of CWS Munitions.

Grenades, colored smoke, M16; grenades, hand smoke, (HC)M8; grenades, incendiary, M14; and grenades, frangible, M1(FS) were available to the force. Grenades, Smoke, (WP) M15, were sought vigorously but were not available for shipment from the United States. In order to provide a basis of issue for these grenades, a Basic Load table (Appendix I) was prepared, approved by the Chief of Staff, submitted to Headquarters Force 141 (Fifteenth Army Group) and approved for publication.

Plans for the procedure for ground-air identification involved, among other things, the use of colored smoke grenades. Tests were carried out, in conjunction with the Signal Officer and the Air Officer, to determine the effectiveness of these grenades. Orders from higher headquarters stipulated that only yellow smoke would be used for front line identification during daylight - and only yellow flares at night. A plan for the distribution of yellow flares, which the Ordnance Officer had obtained from British sources, was prepared and put into effect.

OPERATIONS PHASE

From D-Day until the cessation of hostilities in Sicily, the Seventh Army Chemical Officer had little to do with the operation of the Chemical Battalions (Mtz). The battalions were attached to Divisions and Corps as needed - and all tactical control was centered with the Commanding Generals of the Divisions and Corps. The Army Chemical Officer rendered all assistance possible to the Battalions, to enable them to accomplish their missions. However, for the most part, the responsibility of the Army Chemical Officer for the Chemical Battalions was one of supply of ammunition and replacement parts for the 4.2" chemical morters.

Chemical Battalions (Mtz).

Chemical Battalions (Mtz), equipped with the 4.2-inch chemical morter, were employed in operation HUSKY for the first time. A detailed account of the operations in which the three battalions which reached Sicily took part is to be found in the day to day journal of activities in this book. The 2nd Chemical Battalion (Mtz) saw more action than the other two units, disembarking with the 45th Infantry Division, as part of the CENT sub task force, the Battalion participated in all major encounters in which this Division was involved. The battalion advanced steadily from South Shore to North and then turned east to play its part in the final drive to Messina. When the 45th Infantry Division was relieved by the 3rd Infantry Division, the 2nd Chemical Battalion (Mtz) remained in the line, was relieved and attached to the 3rd Infantry Division, and continued to give effective support throughout the campaign.

The 3rd Chemical Battalion landed with the 3rd Infantry Division,

as part of the JOSS sub task force, encountered little opposition and was in the forefront of the advance to Palermo. As the eastward drive began to shape up, the 3rd Chemical Battalion (Mtz) was relieved and attached to II Corps. During this phase of the operations, the unit was sub-attached to the 9th Infantry Division for one week. However, during the time the Battalion was under II Corps control, it did not fire any missions but was used chiefly as a transportation unit. It is believed that the terrain traversed and the nature of the opposition in several instances were ideal circumstances for the use of both high explosive and white phosphorus shell, fired from 4.2-inch mortars.

The 83rd Chemical Battalion (Mtz) disembarked with the 1st Infantry Division and 1st Ranger Battalion, as part of DIME sub task force. This battalion saw sharp action in the first two days of land operations in the vicinity of Gela and exceeded every demand made upon it. The battalion, while still attached to the 1st Infantry Division, participated in the capture of Butera. Following the fall of this town, the 83rd Chemical Battalion was attached first to the 2nd Armored Division and later to the 82nd Airborne Division, for the advance along the south shore into western Sicily. The few targets which presented themselves during this advance were dealt with summarily by the 4.2-inch mortars.

The deployment of Chemical Battalions (Mtz) in the final stages of the operation is to be found on map, "Location of CWS Units - End of Sicilian Campaign, 20 August 1943."

In general the three Chemical Battalions (Mtz) had similar experiences during their first combat operation. Each was called upon, at times, to fire missions beyond capabilities and beyond its range. Each distinguished itself on every occasion its weapons were employed correctly. Each proved the devastating effect of white phosphorus as an anti-personnel weapon, as well as a screening agent. Each proved the effectiveness of the new HE-filled 4.2-inch chemical mortar shell - both against personnel and against emplacements. Each suffered to a certain extent because of the limited range of the present 4.2-inch mortar. Each found the present 4.2-inch mortar sight inadequate. Each experienced the need for a mortar with traverse up to 1000 mils, in order that rapid adjustment could be made without displacement. Each found the battalion too large for efficient operation.

But chiefly each suffered most seriously because of inadequate and improper T/BA transportation. The heavy transportation at present authorized the battalions is not suited for combat operations. Light vehicles such as trucks, 1/4-ton, 4 x 4 and trailers, 1/4-ton, when available to the battalions on a loan basis from the divisions to which they were attached, were the only satisfactory answer to this problem. (See Appendix II).

CWS Service Units

The CWS service companies were employed in Sicily almost exclusively in supply missions. A report of their activities is included in the Supply Section of this book.

The location of these units and their respective detachments is shown on map, "Location of CWS Service Units - End of Sicilian Campaign, 20 August 1943."

The 12th Chemical Maintenance Company, in addition to its supply function, performed admirably in effecting immediate repair work on 4.2-inch mortars for the Chemical Battalions (Mtz). This company was stationed at an advance ASP, and on two occasions took its repair equipment into the front lines to perform maintenance on mortar equipment. This was done in spite of lack of mobility of the unit. In the course of this repair work, certain necessary changes in mortar equipment were noted, particularly regarding the amount of replacement parts that should be made available. Elevating screws were frequently found to be bent. Base plates frequently cracked. Some unheat-treated barrels were found. The 83rd Chemical Battalion (Mtz) improvised a better sight for the 4.2-inch mortar, the standard sight being inadequate for battalion needs. In addition to mortar maintenance, the 12th Chemical Maintenance Company also continued to recondition 4.2-inch mortar shell and to repair, recondition and salvage CWS protective equipment, including gas masks, decontaminating apparatus, etc. The 21st Chemical Company (Decontaminating), on one occasion, was ordered to an advance ASP, to stand by for action, in the event that leaking gas-filled artillery shells were discovered.

Chemical Smoke Generator Companies

The 69th Chemical Smoke Generator Company arrived at Palermo shortly after that port had been opened. Because of the size of the port, it was decided not to attempt to produce an area screen with the single company. The 78th Chemical Smoke Generator Company arrived two weeks later.

In the meantime, a complete smoke plan had been drawn up and approved by the Anti-Aircraft command and all necessary construction work on smokepot ovens had been completed. Upon the arrival of the 78th Chemical Smoke Generator Company, area smoke screen protection was made available at the port of Palermo immediately. A test run was conducted, revealing certain weaknesses in the screen. These were corrected immediately, leaving Palermo harbor well protected against air attack.

The size of the port necessitated the use of Pots, Smoke (HC) M1, to supplement the smoke of the mechanical generators. Some difficulty was experienced in this regard because of the amount of work required to keep pots burning—due to their short burning time. Also, the Navy objected strenuously to the use of pots, because of the bright flash they produce when burning. Even ovens were not able to hide this.

Use of Smoke by Seventh Army

In general, it may be said that smoke was used to a greater extent by all arms in Operation Husky than it had been in previous operations. On some days both Division and Corps artillery fired as much as 35% smoke shell. Screens were used to assist in infantry attacks and were also used to obscure the enemy's observation of infantry preparations and deployment for attack.

The casualty effect of white phosphorus was used to excellent advantage by infantry mortars, artillery and 4.2-inch chemical mortars. It is interesting to note that the enemy apparently was unprepared for the large scale use of white phosphorus, and that the average enemy soldier appeared to be almost completely uneducated as to its effect.

The incendiary effect of white phosphorus also played a prominent role. On one occasion, a German infantry unit was forced to abandon a well prepared position, because of a large fire started in a wheat field by white phosphorus. On numerous occasions grass camouflage netting on fixed positions was set afire by white phosphorus, forcing the enemy to displace.

On one occasion the Chemical Officer, 3rd Infantry Division was called upon to screen an inlet and beach in a forward area. A supply ship was to be brought in at this point - under enemy artillery fire at the time. Plans were made to produce an effective screen, using Pots, Smoke, Floating (HC) M4 and Pots, Smoke (HC), M1. Materials and personnel to operate this impromptu smoke installation were assembled. However, the unloading point of the supply ship was changed and the screen was not employed.

Flamethrowers.

Flamethrowers were used on only one occasion, and that to burn out a wheat field, from which enemy infantrymen were resisting.

CWS Grenades

Colored smoke grenades were used on a large scale by some divisions - and on a very limited scale by others. In the final stages of the operation, the use of this munition was much more frequent than it had been earlier - due to greater familiarity with the procedures of ground-air identification. The attack order of the 3rd Infantry Division on one occasion prescribed that yellow smoke would be displayed by all forward elements for thirty minutes prior to the assault. Numerous suggestions have been made that a faster burning grenade, producing a heavier, more concentrated cloud of colored smoke, be developed.

Grenades, Smoke, (HC) M-8 were not found to be a useful munition by combat troops. This grenade is regarded as having little tactical value, because of the small amount of smoke produced and the absence of any secondary effect. Grenades, Smoke (WP) M15, causing casualty and incendiary effect, in addition to producing a heavy volume of smoke, were in demand, but were not available.

Grenade, Incendiary, (M14) was used in limited quantities only. The chief use of this munition was in connection with demolition work by the engineers.

Captured Enemy Material.

In the course of the campaign a vast assortment of enemy chemical warfare material was captured. This material included German and Italian gas masks of various types, spare parts for gas masks, protective clothing, decontaminating agents and equipment, flamethrowers, collective protector sets, German Lositan personnel decontaminant, British Protective Ointment (which had been captured and relabelled by the Italians), colored smoke grenades and signals, rocket smoke devices, incendiary grenades, rocket incendiary shells, irritant smoke pots and candles, large stores of Chlorsulfonic Acid smoke material, and a substantial quantity of liquid vesicant agents.

Among these liquid vesicant agents was pure Mustard, in bulk and in artillery shell, and a 50-50 mixture of Mustard and Phenyldichlorarsine. As soon as it was feasible, this material was assembled at two places - Base Ammunition Depot No. 1 at Cerda for Class V materials; and Class II Depot, Palermo, for Class II and IV supplies. Samples of every article believed to be of interest were sent to Chief, Chemical Section, Allied Force Headquarters, for study.

In each case a preliminary report was prepared by Chemical Officer, Seventh Army, to accompany captured material shipped to the rear.

CONCLUSIONS

1. General conclusions that can be drawn are:-

a. Chemical Battalions are an effective unit in support of Infantry.

b. There should be more combined training of all supporting units with the unit to which attached, and especially infantry battalion and regimental commanders should be instructed in the employment of 4.2-inch chemical mortars.

c. Many changes in T/O and T/E of CWS units are necessary.

d. Certain mechanical changes in 4.2-inch chemical mortars, accessories and packaging of ammunition are necessary.

e. The Unit of Fire and/or Day of Supply of certain chemical grenades needs to be revised.

f. There are tactical disadvantages in the use of the Flamethrower and the smoke pot indicating that further development is needed.

2. Details of these conclusions are brought out in the following recommendations.

RECOMMENDATIONS

1. That, when an amphibious operation is being planned, participating units be brought together for extensive combined training - in the same formations that will be employed in the operation itself.

2. That classes in the employment of Chemical Weapons Battalions and 4.2-inch mortars be instituted at the Infantry School for Battalion and Regimental commanders and staffs.

3. That the T/O and T/E for a Chemical Mtzd Battalion (Sep) be revised as indicated in Appendix II.

4. That whenever possible, each Chemical Mtzd Battalion (Sep) remain attached to one Infantry Division, and not transferred from one division to another.

5. That the following changes be made on the 4.2" chemical mortar, accessories and shell package.

a. Increase range to 4500 yards or make a special lightweight shell.

b. Ship only heat-treated barrels overseas.

c. Furnish an accurate sight, of simple design similar to the Italian 81-mm mortar sight, which will sight to flanks or rear.

d. Strengthen the elevating screw.

e. Increase traverse to at least 1000 mils.

f. Strengthen the base plate by heavily welding the Y-angle.

g. Pack 4.2" mortar shell in a water-tight package similar to the 105-mm Ordnance shell packing.

6. That further development work on the present issue flamethrower be discontinued and development directed toward the production of a one-shot, throw-away type flamethrower.

7. That the following changes be made in regard to chemical grenades:

a. Deliver as soon as possible in quantity, and include in the Basic Load of all combat troops, the Grenade, Smoke, WP, M15.

b. Discontinue issue of the Grenade, Smoke, HC, M8 for combat purposes.

c. Decrease the Basic Load of M14 Incendiary Grenades.

d. Make available a colored smoke grenade that will produce an im-

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

mediate thick clouds of colored smoke, and include them in the Basic Load of all combat troops.

e. Discontinue manufacture and issue of Smoke Frangible grenades.

8. That a longer burning smoke pot, with flash-hider, be developed for use in harbor smoke protection.

9. That Chemical Service Battalions, including four (4) Service Companies, and a Battalion Headquarters with Medical Detachment be organized and assigned, one per Field Army.

10. That Chemical Companies be renamed Chemical Service Companies, to perform all Maintenance, Depot and Decontaminating functions; that they be trained in the United States at the same Post as Chemical Weapons Battalions and that Separate Service Companies be authorized one (1) Warrant Officer for administrative work.

11. That the following change in T/E be made:

a. The 7½ KW generator of the Maintenance Company be mounted on a trailer.

b. Smoke Generator Companies be authorized welding equipment.

12. As all harbor smoke installations need two or more Smoke Generator Companies, Battalion Hqrs Detachments for S.G. Battalions should be authorized for each main Port.

13. That a Chemical Laboratory Company or section be assigned to each Task Force the size of an Army, for on-the-spot analysis of captured enemy munitions.

SUPPLY OPERATIONS

PLANNING PHASE

In the early stages of planning phase for Operation HUSKY, in March and early part of April, 1943, details as to exact troop strength, the maintenance plan and the overall supply plan were so uncertain that definite planning was not possible except for major items of equipment. These were requisitioned on the U.S. by the Chemical Officer, AFHQ, and included smoke pots for harbor protection, flamethrowers and flamethrower fillings, training gas masks to equip assault troops. The training gas masks were requested as a result of the lesson learned in operation TORCH when large numbers of service and diaphragm gas masks were discarded on the beaches by the troops due to their excessive weight and bulk. It was felt that with a lighter mask the individual soldier would be less likely to throw it away. Later events proved this supposition to be substantially correct.

Start of Planning.

At the end of March and early in April, various representatives of the supply section moved to Oran to work in close liaison with SOS, NATOUSA, in formulating and executing the supply plan for operation HUSKY. The CWS supply section moved to Oran about 20 April 1943 and immediately submitted the necessary requisition for the UGS-11 convoy, which would be the first convoy from the U.S. to supply Force 343 at Horrified. It was unfortunate that the CWS Supply Section had not been set up in Oran prior to this date as all other supply sections had been set up and were familiar with the supply plan and had established liaison with SOS, NATOUSA.

Logistical Data.

Logistical data necessary for preparing requisitions was lacking in the section upon arrival at Oran. This was corrected by the timely aid of the estimates section of MMS, CWS Section, who were extremely cooperative and gave us access to all their logistical data and aided materially with the preparation of requisitions.

"Phase"Requisitions.

After the first two convoy requisitions, work was begun on the "phase" requisitions. These requisitions were for the supplies to accompany the sub task forces on the assault, and subsequent follow ups. Each sub task force and each follow up required a separate requisition, with time to be laid down, and embarkation point to be laid down at, for each lot of supplies. Numerous inevitable changes in troop strength and units participating required additional phase requisitions on SOS, or changes on ones already submitted.

CWS Class II Restrictions.

Under the 3rd Outline Maintenance Plan, no CWS Class II Supplies were to be carried forward into Sicily, but such supplies as needed for maintenance were to be earmarked from North African Stores for the first twenty-one days, subsequent 21 day maintenance requisitions were submitted for UGS-11 and following convoys, each convoy with a 15 day interval, building up the reserve to a 30 day working level, supplies after that to be requisitioned on a 15 day basis only. These Class II supplies were to be held in North African Depots subject to call forward to HORRIFIED as needed. Shipments on convoys from the U.S. were not to be sent to HORRIFIED but unloaded in North African ports.

Later events proved the plan reasonably sound, as no gas warfare was encountered but it was proven that a small portion of this maintenance was needed, especially for the replacement of combat losses of gas masks, of which there were no replacements in Sicily for several weeks after the operation started. The only Class II supplies that reached Sicily in the early phases of the Campaign were maintenance parts for the 4.2-inch Chemical Mortar, maintenance for the flamethrowers and the extra training gas masks that were a component part of the assault packs prepared by the QM for beach maintenance.

CWS Class V Plan.

The restriction imposed by the maintenance plan on Class II supplies in no way applied to Class V, which includes grenades (chemical) of CWS issue, 4.2-inch mortar shell, smoke pots and floats, flamethrower fillings. Due to confused D/S and U/F figures on colored smoke grenades, white smoke grenades and incendiary grenades, maintenance factors and a Basic Load Plan was set up on these items. Later events proved these factors to be excessive, chiefly due to no use of the HC white smoke and incendiary grenades. Colored smoke grenades were used to a certain extent but not as extensively as planned.

CWS Service Troops.

For the handling of CWS Class II Supplies detachments of the 21st Chemical Decontaminating Company, 63rd Chemical Depot Company, and 12th Chemical Maintenance Company were allotted to the sub task forces. As to how the supplies were handled when over the beaches was a responsibility of the sub task forces and no definite plan was formulated until such time as 7th Army would take over the supply installations. As later proven, such a plan should have been formulated prior to departure for Sicily, as it was necessary to make such plans upon arrival in Sicily. In short, these plans as finally carried out, provided for handling of CWS supplies by CWS personnel in Ordnance ASP's. Results were very satisfactory.

Faulty Ammunition.

Complicating the supply of 4.2" mortar shell for the battalions was the discovery of bad shell, necessitating reconditioning and waterproofing of a large number at the last minute. Also, one shipment of shell was destroyed by explosion, necessitating replacement from already limited stocks.

Finish of Supply Planning.

Towards the end of the planning phase the phase requisitions were completed and only a few additional phase requisitions were necessary plus routine convoy requisitions upon PEMBARK. Most of the time in this latter period of the planning phase was occupied by coordinating the requipping of units alerted for operation HUSKY with SOS, NATOUSA and seeing that the chemical units participating secured full T/BA equipment of all types. Complicating this was the fact that SOS had frozen all stocks necessary to cover phase requisitions, leaving in some cases shortages of certain items which participating units had not received. Thus a lot of labor and time was necessary to release this material to units to bring them up to T/BA.

Supply Liaison.

Just prior to movement of the CWS Section officers leaving on D-Day convoy to embarkation point, one officer was left in Oran to act as liaison with SOS. One officer went to Biserte for liaison with ENS and one officer joined main headquarters of Force 343. Upon arrival of D-Day group in Algiers, liaison was established with MMS representative there, and with Chemical Officer, AFHQ, and supply problems on gas masks, smoke pots and grenades worked out satisfactorily. Liaison was also established with the units loading at Algiers and shortages checked. Upon boarding headquarters ship it was found that a considerable number of personnel were not equipped with the training gas masks. Necessary arrangements were made and then secured from MMS.

OPERATION PHASE

Initial Phase.

Upon arrival in Sicily, the responsibility of unloading supplies from ship to shore was, until taken over by the 1st Engineer Special Brigade, the responsibility of the sub task force concerned. At this time the CWS supply section of 7th Army exercised no direct control over the supply installations set up separately by the different Task Forces. Beach dumps were set up by the CENT force in the vicinity of Scoglitti and Vittoria, by the DIME force in the vicinity of Gela on Red-green beach and by the JOSS force at Licata. All of these dumps contained CWS Class II and Class V supplies.

Handling of the supplies by the sub task forces and establishment of dumps was done by the use of service troops allotted to these forces. In the case of JOSS force, prior to their departure from North Africa they set up what they termed a "Force Depot", which contained detachments from each service destined to arrive in Sicily shortly after the first landing. This group took over the establishment of all dumps and depots once the supplies had been landed over the beach. Their plan was very successful for handling CWS supplies. The CWS section of the Force Depot was a detachment of the 12th Chemical Maintenance Company.

The time interval between landing in Sicily and the taking over of all supply functions from the Sub-Task Forces was occupied by the CWS supply section in checking beach dumps and inland ammunition dumps, coordinating the supply of CWS Class V among the task forces, checking supply of 4.2-inch mortar shell to the Chemical Motorized Battalions and collecting and evaluating captured German and Italian CWS material.

Formulation of Supply Plan.

The 1st Engineer Special Brigade took over the operation of all beach dumps and ASP's, 17 July 1943, under technical control of 7th Army. Responsibility for supply by 1st Engineer Special Brigade was from ship to shore to forward depots. At this time plans were formulated with consent of Ordnance so that in each ASP there would be a CWS section for CWS supplies, to be operated by CWS personnel. For this purpose a detachment of 12th Chemical Maintenance Company was utilized at Gela. CWS Class V supplies in Vittoria - Scoglitti area were stored in Ordnance ASP's and later concentrated in the Gela - Licata area. A representative of the CWS supply section, 7th Army, was detailed on TD with the 1st Engineer Special Brigade for coordination of CWS supplies.

In as much as three chemical battalions were operating in three different directions from the South shore, it was necessary to set up a target for CWS Class V supplies to include 4.2-inch mortar shell for CWS sections of Ordnance ASP's at Caltanissetta, Agrigento, and Petralia. Targets were set up for Sciacca and Allessandria but were shortly cancelled due to tactical changes of the mortar battalions. The supply of 4.2-inch mortar shell in the Vittoria - Scoglitti area was utilized to support the 2nd Chemical Battalion (Mtz) attached to the CENT Force. All targets were submitted to the 1st Engineer Special Brigade for fulfillment. Shortage of transportation delayed the complete filling of all targets set up, but sufficient material did arrive at ASP's to fill tactical needs. (See Map, Chemical Warfare Ammunition Supply Points).

Expenditure Reports.

Expenditure reports throughout the action were of little or no value in estimating daily expenditures of CWS material. In some cases these were included in Ordnance expenditure reports but were incomplete.

Supply for North Shore.

Upon arrival at Agrigento a definite supply plan was formulated. The decision was reached that the Seventh Army would operate supply installations on the North shore and the 1st Engineer Special Brigade would operate existing supply installations on South shore including the ports of Porto Empedocle and Licata. Upon arrival at Palermo, plans were made by CWS supply officer and the Ordnance ammunition officer for the establishment of ASP #14 at Bagheria, ASP #13 at Terwini Imerse and ASP #15 at Campofelice. For operating the CWS section of ASP #14 one platoon of the 21st Chemical Company moved from the Vittoria area to Palermo and thence to Bagheria. This platoon established and ran ASP #14 for approximately one week until the arrival of an ordnance ammunition company. Upon arrival of a second platoon of the 21st Chemical Company at ASP #14, a detachment was moved to ASP #15 to operate the CWS section of this ASP. Normal flow of supplies to these two ASP's was by truck to ASP #14 and by rail to ASP #15. At the same time CWS Class V supplies were moving into ASP's #8 at Petralia and #12 at Caltanissetta from the South shore. The CWS section of ASP #12 was being operated at this time by a detachment of the 63rd Chemical Depot Company with the balance of the 63rd Chemical Company operating CWS sections of ASP's at Licata, and Agrigento under the 1st Engineer Special Brigade. The 12th Chemical Company (less detachments) was then moved to Nicosia to operate CWS section ASP #16. A detachment of the 12th Chemical Maintenance Company, arriving directly in Palermo from North Africa, established the CWS Class II Depot at Palermo and later, upon arrival of balance of 21st Chemical Decontaminating Company, moved forward to San Stefano and established CWS section ASP #17. Supplies for CWS section of ASP #17, consisting mainly of mortar shell and colored smoke grenades, were moved from the South shore by coaster. Due to crowded condition of ASP #17, these supplies were moved forward some 12 miles east of San Stefano and then later moved to vicinity of S. Agata where the CWS section of ASP #18 was established by the same detachment. (For Comparison of Expenditures of 4.2" Mortar Shell with build up of depot stocks, see Graph #1).

CWS Class II Depot.

During this period the CWS Class II Depot at Palermo, operated

by a detachment from the 21st Chemical Decontamination Company, was put in operation and supplies consisting of large quantities smoke pots, smoke floats, fuel oil and Fog oil were unloaded at Palermo and moved to the bivouac area of the 69th Chemical Smoke Generator Company. On 14 August an urgent radio from SOS NATOUSA called for 50,000 training gas masks to be shipped to North Africa for other operations. This necessitated the turning in of all training gas masks in the hands of troops and exchanging them for service and diaphragm masks. A "production line" was set up at the CWS Class II Depot to service, test and pack these masks for shipment to North Africa.

Concentration of CWS Class V Supplies on North Shore.

Just prior to the close of the campaign, a site was selected by Ordnance for Base Ammunition Depot #1, 9½ miles east of Palermo. A CWS section was selected and a detachment from the 21st Chemical Decontaminating Company was moved into the area. This location was soon changed to the vicinity of Cerda and the detachment was moved to the new area. Base Ammunition Depot #1 was selected as the concentration point for all CWS Class V supplies on the North shore and movement of supplies into it was begun about 19 August.

Liaison with Base Area Group

During the latter part of the campaign, representatives of the CWS section of the Base Area Group worked in the office of the Chemical Officer, Seventh Army, so that they would be familiar with the supply set up when they took it over from Seventh Army at a later date. At the same time a representative of the Base Area Group was working with the 1st Engineer Special Brigade on the South shore.

CONCLUSIONS

1. General conclusions that can be drawn from the operation are:-

a. CWS Supply planning operations started at a late date and with insufficient logistical data.

b. The plan for sending forward no Class II replacement supplies did not prove to be sound.

c. Certain changes in equipment and maintenance factors are necessary.

d. The "Force Depot" system as used by JOSS Force was successful.

e. The plan for CWS sections, with CWS personnel, in Ordnance ASP's was highly successful.

RECOMMENDATIONS

1. CWS Supply planning should begin at the same time as other supply sections.

2. Complete logistical data must be at hand.

3. Ship forward at least 5 D/S of Class II items for troops participating, to come in at least by D plus 15.

4. Requisitions for supplies to be shipped into theater must be submitted early enough to insure their arrival in time for distribution to troops.

5. Light weight gas masks are necessary, at least for assault troops. Should not exceed weight of present training gas mask.

6. Proper Day of Supply on chemical grenades should be used. Since operation HUSKY, data received from Office of the Chief, Chemical Warfare Service, gives proper Day of Supply.

7. Determine beforehand if troops intend to utilize weapons and supplies issued to them. Some items were carried, with no tactical plan for their use, such as flame throwers, HC Smoke and Incendiary Grenades. Division and Corps Chemical Officers should have full appreciation of tactical plan at earliest opportunity.

8. Formulate as early as possible a concrete supply and maintenance plan and have as few additions and changes to it as possible.

9. Have formulated beforehand a definite ammunition storage and forwarding plan. In the case of CWS Class V supplies, this should be worked out in conjunction with Ordnance.

10. The "Force Depot" system as utilized by the JOSS Force for handling supplies over the beach to dumps should be followed by Sub-Task Forces.

11. Insure sufficient transportation to be allotted for moving supplies forward.

BRUCE T. HUMPHREVILLE,
Major, CWS,
Chemical Officer

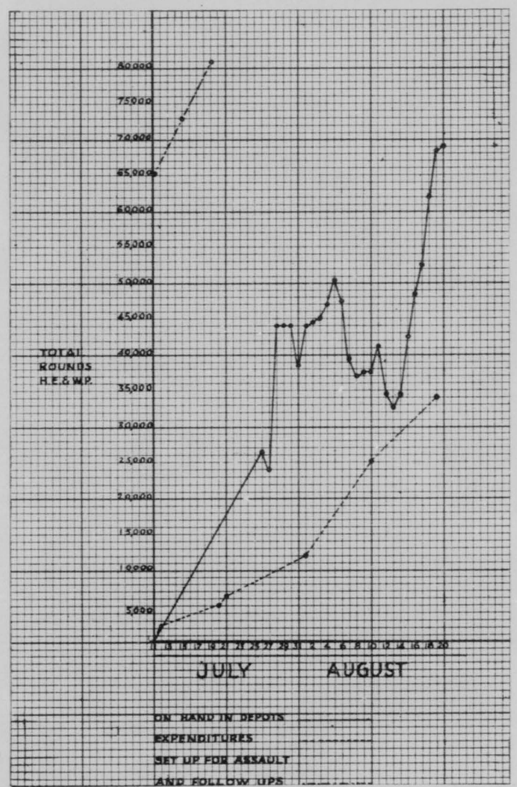
Recommended T/O for CHEMICAL REGIMENT

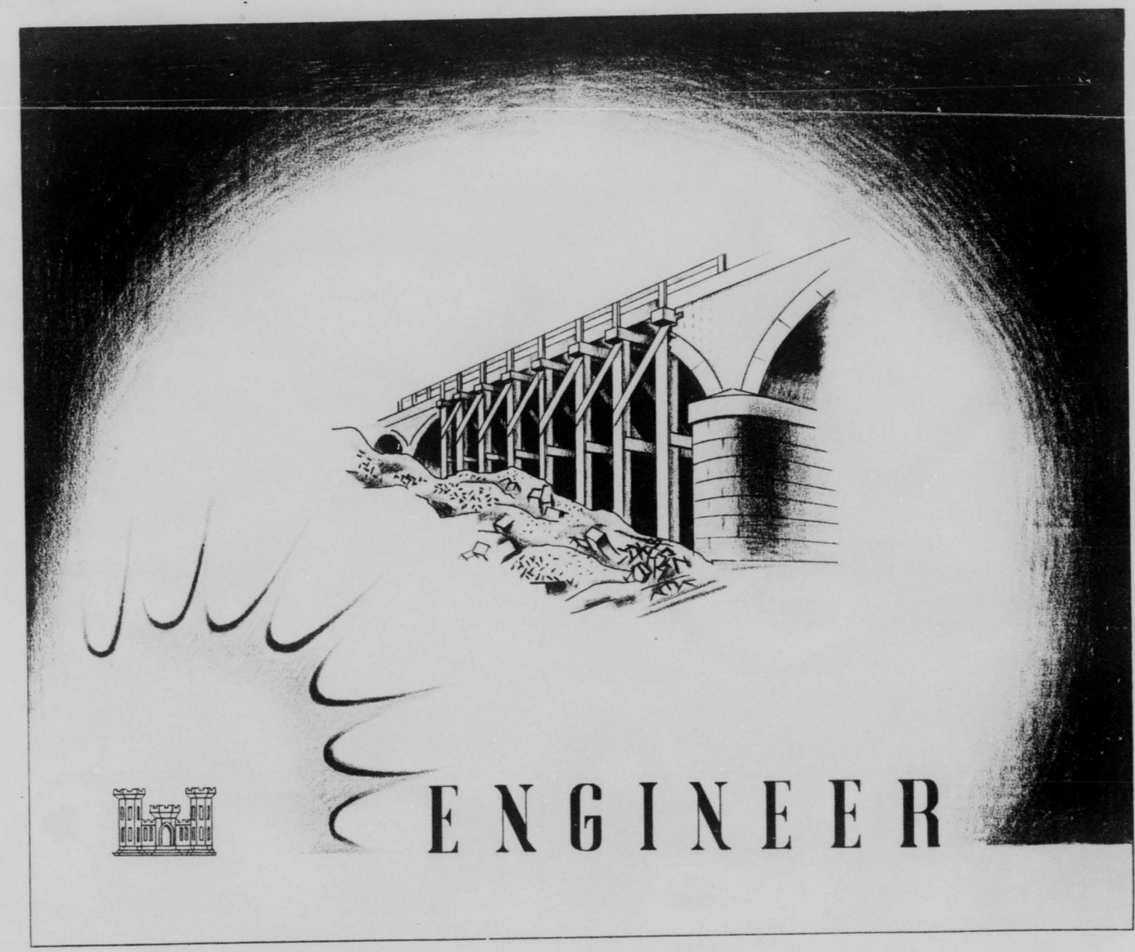


Headquarters Company — 6 mortars (no mortar platoon set-up)
Approx. 95 EM 4 Officers
Approx. 17 ½-ton truck & trailers
2 - 3/4-ton Weapon Carrier
2 - 2½-ton trucks
1 - 1-ton trailer

Battalion (3 companies)
Battalion Headquarters Detachement: Approx. 20 EM 5 Officers
Approx. 4 ½-ton trucks & trailers
1 - 3/4-ton Weapon Carrier

3 Weapons Battalions

Regiment (3 weapons battalions)
Regimental Headquarters Company: Approx. 120 EM 12 Officers
Approx. 6 ½-ton trucks & 4 trailers
14 - 2½-ton trucks
13 - 1-ton trailers
1 - Ambulance, 3/4-ton
2 - 3/4-ton C & R
2 - 3/4-ton Weapon Carrier
1 - Radio Carryall



The above is the recommendation of two Chemical Battalion Commanders. It has not been tried out, consequently figures are approximate.

Above is a graph showing the status of supply and rate of expenditure of 4.2 inch mortar shell in Operation HUSKY from D-Day, 10 July 1943, until the conclusion of the campaign in Sicily. H.E. and W.P. filled shell have been lumped together. Expenditures of the two types were approximately equal. All expenditures were made by the 2nd Chemical Battalion (Mtzd), 3rd Chemical Battalion (Mtzd), and 83rd Chemical Battalion (Mtzd), equipped with the 4.2 inch Chemical Mortar, M1al. Amounts of 4.2 inch mortar shell shown as set up for assault and follow-up convoys represents amounts set up for loading in North Africa on D, D plus 4, and D plus 8 convoys, plus amount loaded in U.S. by Cent Force.

ENGINEER

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

REPORT OF THE ENGINEER

I. INTRODUCTION

This report of the engineer activities during the Sicilian Campaign starts with the planning stage and carries through the operation to the 22d of August 1943, five days after the fall of Messina. During this time, fifteen different types of engineer units were engaged.

Plans were initiated on the 25th of March 1943 by the Engineer Section, I Armored Corps, organized according to the normal T/O, which provides six officers.

A considerable amount of detail is included in the first part which covers the planning stage. This is considered necessary because the success of any operation, in so far as higher headquarters is concerned, depends more upon the planning which preperes units to perform their role and insures the presence of adequate personnel and supplies when needed, than upon any other factor.

II. PLANNING STAGE

a. It was necessary to plan not only for all of the many and varied engineer functions in a combined operation, but also for the prompt repair of a major port and of the utilities of a city of 400,000. It was expected that all of these would have been subjected to our own bombardments as well as the demolitions and perhaps bombardments of the enemy. Also, it was necessary to insure the supply of water on an island that had no surplus even with only normal demands, and to insure the quick passage of our troops over roads in mountainous terrain crossed by a myriad of ravines and gullies.

b. The plans had to be made with a small staff without any indication of the development of the problem beyond the initial stage and involving supplies whose requirements had to be anticipated in many cases by upwards of 90 days in order to obtain shipment from the United States.

c. The first step in the planning was to set up the basis for planning. As little was known of the course of action after the initial assault, the following assumptions were made:

(1) Palermo would be taken by D / 8.
(2) Damage to the harbor and lines of communications would be severe. The Engineer would provide for all necessary repair and construction to include D / 60.
(3) Responsibility for the movement of troops and supplies at all beach heads would rest initially with each sub-task force commander.
(4) The 1st Amphibian Brigade would subsequently establish and service beach dumps and initiate repair of all ports used.
(5) Special engineer troops would be available to Sub-task Force Commanders for assistance in maintenance of lines of communications, clearance and laying of minefields, water supply, camouflage of supply installations, construction of bulk fuel storage, maintenance of lightering points. These troops and responsibilities would pass to Army by D / 14 or as soon thereafter as the occupation of the west end of the island was completed.

Based on these assumptions an engineer staff planning guide was made up by the Engineer while the members of the engineer section familiarized themselves with all available information on Sicily. The purpose of the guide was to control the planning to be sure it was coordinated, in accordance with policy and complete, and to outline the general solution desired. When compiled it covered some 29 subjects in 62 pages.

The staff then expanded this into the engineer task force planning guide by working out the details of the various subjects. These were consolidated and a copy of the detailed guide furnished each of the key members of the section to insure our complete coordination and to familiarize everyone with all the plans. The operation was changed from the west end of Sicily to the east end on May 19, requiring a complete revision of the guide. It was then briefed into a planning guide (Incl. #1) for general distribution among all the engineers of the task force to guide all the engineer planning to insure coordination throughout.

On May 29, the guide was presented to each Sub-task Force Engineer and on June 13 the complete Engineer plan was presented to the same group at a conference.

No. 13 - Pictures, Enemy Fortifications.

The annexes to the Administrative Order and to the Field Order were completed on June 15 and 18 respectively.

Training.

The problems involved during the training particularly included passage of natural and artificial obstacles in the water and artificial obstacles on and beyond the beaches during the assault, operation of supply installations for a large force over the beach for a period estimated at 60 days, and the training of Task Force engineer service units.

a. The assumed function of the Engineer of the Seventh Army in connection with the assault was to determine the type of obstacles likely to be encountered on the beaches, determine the best method of passing each, to insure that this information was passed on to the Sub-task Forces and incorporated in their plans and training, and to insure that the necessary supplies for the recommended method of assault were available for proper combat loading.

At the direction of the Commanding General, arrangements were made early in March and a program set up for a Company of the 36th Engineer Regiment to conduct experiments at Port Lyautey, French Morocco, to determine the best method for the passage of artificial obstacles in the water and on the beaches. This program was interrupted just as it was getting under way, by the movement of the 36th Engineers to Arzew with the 3d Division. No engineer troops were available to replace them until early in May when engineer units at the FAITC were made available to continue the experiments.

During the period, aerial photographs were continually studied to determine the development of beach obstacles on the beaches of Sicily and descriptions were obtained of beach obstacles employed by the Germans along the channel coast of Western Europe. From these an estimate was made of the probable obstacles that would be encountered, and passage of these obstacles was included in the program of experiments.

The experiments were completed the end of May, conclusions reached and recommendations passed on to each of the Sub-task Force Engineers including our estimate of the maximum obstacles likely to be encountered, the best method to overcome each obstacle, and information on how the necessary supplies would be set up to facilitate loading for the assault.

During this period, periodic checks were made on the assault training at the FAITC. These revealed that the obstacles then being used for the training were inadequate and it was not until the late stages of the training that adequate obstacles for proper training were included.

During May, experiments were also continued to determine the best method for unloading vehicles on shores screened by false beaches. There were two possibilities, either removing the false beach or providing a suitable connection between vessels grounded on the false beach and the shore. The possibility of blowing or dredging channels through the false beaches was investigated.

The Navy did not believe dredging early in the action was practicable and the possibility of dredging was eliminated by the Navy on May 26th. Experiments on blasting were conducted by blowing bars with bangalore torpedoes, explosive mats and bulk charges. These were completed on 18 May 1943, and while they indicated that this might be a possible solution, it was not considered a satisfactory one. In the meantime, the Navy was experimenting with steel pontoon causeways and the Army with the construction of hasty piers by a variety of means. The construction of the piers did not prove practicable. The Navy causeways appeared the logical solution if a practical scheme for launching them could be arrived at. Contact was maintained with the Navy in all experiments. Up to the end of May, no satisfactory solution had been presented, because the Navy desired to eliminate all towing if possible, although a satisfactory solution had been worked out by the C.B.'s in the United States prior to their embarkation for North Africa.

The result was that up to that date, no units had had any practice in unloading vehicles from grounded LST's. A report was made to the Commanding General to this effect, as a result of which a combined Army and Navy Board was set up on June 1st to decide on the proper solution to this problem as well as to other problems including the supply of bulk water from Navy craft to shore tanks.

A recommendation on the solution of the causeway problem which was nothing more than the procedure developed months before at Newport was made on June 5th, and from that date on, it was possible to give drivers practice in unloading vehicles from LST's over the causeways. Proficiency was reached in their use so that the first vehicles were generally unloaded in 22 minutes, although changes first had to be made in the ramp design.

A critical part of the training in the passage of obstacles was the program for mine training. Training in mines had been continuous in the I Armored Corps since December. From March until the units moved to the FAITC, arrangements were made to keep the quota of the I Armored Corps at the Fifth Army Mine School filled and to continue the unit mine schools within the Corps. The latter part of April, the methods of instruction at the Fifth Army Mine School and the FAITC were checked to be sure that their instruction was coordinated and in conformity with the ideas of the Commanding General, Force 343. During this entire period we were badly handicapped by a failure to procure sufficient enemy mines for training purposes, despite repeated attempts to do so.

b. The function of the Engineer, Force 343, in connection with the training of shore engineer regiments was to insure for the Commanding General that the training to maintain our supply was adequate. On June 3 the Commanding General of the 1st Amphibian Brigade was charged with the responsibility of training, equipping and organizing the shore units. The training was handicapped because training in invasion tactics was carried on at the Fifth Army Invasion Training Center over which this headquarters had little control.

A regular check of the training was made through periodic visits by members of the section and inadequacies were called to the attention of the Commanding General.

In determining methods of water supply, it was decided that the supply of water in bulk over the beaches would be desirable. On June 9 arrangements were finally made to equip twenty LST's to carry 10,000 gallons of water each. A standard procedure was outlined by the joint Army-Navy Board for the delivery of this water. Shore Battalions were equipped with canvas tanks and hose and were instructed in the method to be used. The actual operation proved highly successful.

c. A serious handicap in the training of engineer service units lay in the fact that many units were not available to the Task force until shortly

SECRET

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

before D day and in many cases not until after D day. Further, these units were spread from Oran in Algeria to Tunis and Bizerte in Tunisia. The only control that could be exercised over the training of these units was through personal contacts by members of the section to inform the Commanding Officers of the units that they would probably take part in an overseas operation in the near future, give them what very general idea of the operation was possible in view of the security requirements, and to assist them directly in the most important parts of the training, which were considered to be mine and camouflage training and water discipline.

Personnel.

During the planning phase the Army Engineer was considerably handicapped by the lack of an adequate staff. On April 7 a request was made for sufficient experienced officers to increase the staff from that of an Army Corps to that of a Reinforced Corps. The majority of these officers did not report until late in May, when the planning was practically completed. The Engineer Section of the proposed Base Area Group did not arrive in the theater until June 25, too late to do any planning.

In determining the engineer units necessary for the operation, the planning guide established a tabulation of all the missions the engineers would probably be called upon to accomplish during the first 60 days. Against this tabulation of missions a list of the necessary engineer units to accomplish each was set up, including a chronological transfer of responsibilities as the action progressed. From this list the requirements for engineer units for the operation were determined.

Supply.

It was necessary that our supply requirements for the operation be submitted to SOS on April 18, approximately 90 days before D day. It was extremely difficult to complete this list properly in the 3½ weeks between March 25th and April 18th. This lack of time and lack of knowledge of the complete tactical plan necessitated the requisitioning of equipment and supplies to meet all possible emergencies and thus resulted in some over supply.

a. Initially, the requirements for mine detectors was set up on the basis of the general directive of the Commanding General, Force 343. Later this had to be reduced and a T/BA which was approximately half again as large as that recommended to the War Department by AFHQ at the close of the Tunisian campaign, was submitted to the Signal Corps (See Recommendations on changes in T/BA).

On the 20th of June we received final assurances that the issue would be completed in accordance with the revised T/BA, but in many cases late deliveries prevented adequate training in the use of the instrument.

b. Special attention was given to the supply and loading of pest control materials in view of the fact that the operation was to be through a country noted for insect borne diseases.

c. On June 5 there was set up at each port of embarkation for each sub-task force a tactical stock pile consisting of the estimated maximum supply requirements of the task force engineers. This was done in order that they could draw on these stockpiles and insure the desired loading of the supplies they would require for the assault and for the first follow-ups. These included two Bailey bridges for each sub task force. A total of ten were available. Two were allotted each sub-task force for the operation, and the remaining four were kept in task force reserve. Recommendation for the shipment of these bridges was made as follows:

Date	Force	No. Bailey Bridges
D	Dime	1
D + 4	Dime	1
D + 8	Dime	1
D + 14	Cent	2
	Joss	2
	Task Force (Joss)	1
D + 20	Task Force	2

d. Another supply problem was the proper loading of bulk fuel storage supplies to insure that they could be readily located and identified to facilitate prompt delivery and to insure completion of the initial part of the installation by D + 8, the main portion by D + 12 and the balance by D + 20.

These materials were specially marked with two parallel red stripes around each box in addition to the regular engineer marking. One hundred and fifty percent of the estimated required supplies were ordered for the project. Efforts were made to have these supplies deck loaded in equal halves on two coasters due to arrive on D + 4 and for a member of the section to travel on one of the coasters with the supplies. This was not possible and the supplies were finally loaded on seven different ships.

e. In March AFHQ assumed the responsibility for the supply of maps. The initial requirements for maps were determined on April 1st on the basis of a tentative troop list. These requirements were revised and submitted to Force 141 on April 15th when more positive information on the troop list was available. On May 28th, the Division Engineers were informed of the map distribution plan under which Force 343 assumed responsibility for bundling the maps by regiments and for divisional troops, for delivery by June 26th. A request was made on the Sub-Task Force Engineers at this same time for their detailed map breakdowns.

The initial plan contemplated the completion of the delivery of all maps by June 15 to a breakdown depot that was to be established by Force 343 at Constantine. The map depot was established at Constantine on June 5th. On June 18th we were informed that the maps would not be available until June 29th (D - 11). This presented a very complicated problem to insure delivery in time, and yet maintain the necessary security. It required detailed information that was still not definite on the assignment of units to ships and craft that were spread from Oran to Bizerte and delivery to a variety of widely spread points while still maintaining the proper security. A.F.H.Q. agreed to make the breakdown and arrangements for delivery of the maps. The executive officer and both map officers of the Engineer Section were sent to Algiers and Constantine on June 24 to insure the proper execution of the plan. Maps were delivered successfully according to the following schedule:

June 29 - 30	To assault units embarking at Algiers and Oran.
July 1 - 2	To assault units embarking at Bizerte and Tunis.
July 2	82nd Airborne Division at Constantine Airport.
July 2	To Follow-up units embarking in Algiers.
July 4	To Follow-up units embarking at Bizerte and Tunis.
July 9	At Bizerte and Oran for units of 9th Division.

f. An important item, was to insure that engineer units were accompanied by adequate equipment. This created the problem of selling the idea that engineer operational equipment such as bulldozers, compressors and dump trucks are just as essential to the engineers if they are to accomplish their missions successfully, as are rifles to the Infantry and field pieces to the Artillery, a fact that is too often lost sight of. A special effort was made to insure that a policy was established to provide proper consideration for the loading of engineer equipment and a caution to follow-up on this policy was given to the Sub-task Force Engineers at the meeting on June 13th.

The Engineer Section moved to the Monrovia on June 29 (D - 11) but control was exercised over the issue of the maps until D - 9 and efforts were made to influence the training of Task Force units until D - 4 and their proper equipping up to D day.

III. OPERATIONS

A. General

Favorable comment on the work of the Engineers in the Sicilian Campaign has been made by the higher headquarters commanders. This has resulted principally from the work performed by the combat engineer units in maintaining lines of communication, and the clearing of mined areas. It has been in effect, a field day for engineer troops in that there has been a great deal of engineering work to be done, and in general, sufficient personnel and equipment available to accomplish the work efficiently. This applies not only to the combat engineers and the missions mentioned above, but applies as well to all engineer service functions performed under the supervision of Division, Corps and Army engineers.

A detailed narrative of the day by day operation of engineer units is not attempted herein nor is it considered necessary to repeat in detail the engineer reports of the various subordinate headquarters. Particular reference is made to complete reports already prepared by the Engineer, II Corps and the Commanding Officer 1st Engineer Special Brigade on the activities with which they have been more intimately connected. The report does, however, deal to some extent with all phases of engineer work and engineer supply, giving particular attention to those functions which have been of immediate interest to the Army Engineer.

B. Narrative

From the beginning, engineer activities followed quite closely the plan as worked out prior to D day. These activities began at H hour or shortly thereafter in the areas of all sub-task forces. Engineer units landed according to schedule and with few exceptions all engineer units were soon engaged in their normal role. Beach roads and beach dumps were immediately established in the vicinity of Scoglitti, Gela, and Licata so that unloading was proceeding satisfactorily on these beaches early on D day. All Engineer units landed were initially under control of the engineers of the sub-task forces. It developed however, that the division engineers were primarily involved in their normal combat missions and were not greatly concerned with the operation of the beaches and supply dumps. The Commanding Officers of the shore regiments, therefore, were in comparative independent control of their respective unloading operations until responsibility was assumed by the 1st Engineer Special Brigade on July 19.

Members of the Engineer Section were ashore at Licata and Gela on D day and thereafter maintained close liaison with the Engineer shore groups, and other engineer units in those sections.

Beginning on 12 July, daily situation reports were received from the Engineers of subordinate headquarters, and through these reports and frequent visits to the forward areas, the section was kept informed on the problems of all units. All information of importance was forwarded to Engineer, 15th Army Group in daily Sitreps. During the initial phases of the operation, to include capture of the bridgehead from Caltanissetta to Agrigento, engineer problems other than unloading over the beaches and through the damaged port of Licata, were not serious. Few bridges were destroyed and only occasionally were mined areas encountered. All beaches, however, were mined and some heavy equipment was lost before the shore engineers were able to adequately clear and mark safe lanes. Preparation of landing strips and the rehabilitation of airdromes was initiated on D-day by the combat engineers in the II Corps sector, and by the 815 Engineer Battalion in the 3rd Division Sector. Supervision of this construction was assumed by the Air Force Engineer during the first few days of the attack and was thereafter of little concern to the Division, Corps or Army Engineers. Preparation of bulk fuel storage facilities was started on 16 July at Gela. Complete details as to this work are included elsewhere in the report.

The engineer section of headquarters was established in Gela on 11 July. It remained there until 23 July when it moved to Agrigento. During this period, there were no engineer units directly under the control of the headquarters. Upon formation of the Provisional Corps for the advance on Palermo, 17 July, one officer of the Army Engineer Section was attached to that headquarters as Engineer liaison officer. No attempt was made to organize a Provisional Corps Engineer Section, with the result that the 3rd Division, 2nd Armored Division, and 82nd Airborne Division operated with little technical supervision from the higher headquarters during the rapid advance from Agrigento to Palermo. During this advance, however, no serious engineer problems were encountered. Comparatively few bridges were destroyed, and in only one or two cases did they result in noticeable delays in the movement of traffic. In many cases, the principal roads had been mined for demolition, but the rapid advance had apparently prevented the enemy from setting off charges and few craters were actually blown. Although some anti-tank and anti-personnel minefields were encountered, they were neither numerous nor extensive, and were not considered a serious obstacle.

During this same period, the II Corps moving north from Caltanisetta, was running into greater difficulty opening and maintaining lines of communication because of more extensive and thorough enemy demolitions. It immediately became evident that Bailey Bridges would be required in large numbers earlier than expected and necessary steps were taken by this section to procure them from Africa as soon as available shipping would permit. The II Corps was able, however, through the excellent work of the engineer combat regiments and battalions, to construct bypasses around demolitions in sufficient time so that the rapid advance to the north coast was not seriously impeded. In this sector the increased use of mines on all roads soon made the constant use of mine detectors necessary.

On 24 July, an Advance element of the Army Engineer Section arrived in Palermo for an early reconnaissance of the Port Area and all utilities. On the following day the remainder of the section arrived in Palermo. Plans were soon made for the port reconstruction which had been started by the 20th Engineer Regiment on 24 July, and also for the rehabilitation of necessary utilities. From that time on, engineer reconstruction work was accomplished by the various special engineer troops working under the direct supervision of Army Headquarters. Necessary coordination with AMGOT and the Engineer Section, Base Area Group, was accomplished. Several officers of this latter section were attached to the Army Engineer staff until the G.A.C. was organized.

The II Corps continuing its operations had turned east and had begun to advance toward Messina. It was apparent at once that the engineer problem from there on would be increasingly difficult. The enemy was accomplishing systematic demolition of all bridges on the principal routes, almost all roads were mined, and extensive anti-tank and anti-personnel minefields were encountered, particularly along the coast road. At this time, however, the Bailey Bridges previously ordered began to arrive and were immediately shipped to II Corps for use. In addition, the Army Engineer directed the transfer of approximately 16 D-7 bulldozers from the shore regiments of the 1st Special Brigade to the II Corps combat facilitated, and kept pace with the rapid advance to Messina.

Behind the Corps rear boundary, the 20th Engineer Regiment and 343rd Engineer Regiment shared road maintenance responsibility within the Army zone. Similar responsibilities were assumed by the 1st Special Brigade and the Provisional Corps within their respective areas. Additional work accomplished by these two regiments included the reconstruction of 6 railroad bridges, clearing of minefields, destruction of enemy mine stocks and miscellaneous construction work in and around Palermo. On 23 August, the 20th Engineer Regiment began the construction of trestle bridges, culverts and concrete fords at all demolished bridge sites on Route 113, between Palermo and Capo d'Orlando to insure passable routes throughout the rainy season. On 23 August, the 343rd Engineer Regiment began work on a similar mission between Capo d'Orlando and Messina and on the road between Capo d'Orlando and Randazzo. This assignment was the result of an agreement reached in conference on 14 August between the Engineer, 15th Army Group, and the Engineer, Seventh Army. On other principal routes, similar work is being accomplished by engineer units of subordinate headquarters and by civilians under direction of AMGOT and the Engineer, Base Area Group.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

C. Troops.

Inclosure #2 shows in detail the initial attachment and schedule for arrival of those units which eventually came under control of the Seventh Army Engineer. Adequate personnel was available to perform necessary tasks and at no time have any units been idle.

In general, each engineer unit was engaged primarily in the role for which organized. Perhaps the only real exceptions were the use of 1 Bn. of the 39th Engineer Regiment as combat infantry in the attack on Gela, and the 20th Engineers on a flank security mission during the early stages of the 3d Division attack.

D. Mines.

During landing operations, enemy-prepared beach defenses were found to contain large quantities of Teller and "S" mines, some of which were hooked in series with trip-wires and pull igniters. Although a large percentage of these mines were booby-trapped, the action of sand and salt water caused many to be inactive. The mining of prepared inland positions was similar, although in many cases large, carefully prepared, bulk charges and delayed-action charges were used in place of mines. In the Enna-Caltanissetta area, enemy mining was comparatively light. From Termini Imerese to Messina, along the coast, heavy mine belts around demolitions and road craters were encountered. Indiscriminate mining of road shoulders forced Division Engineers to sweep every road and shoulder thoroughly before opening to traffic.

During the operation, two new types of enemy mines were encountered, a German Wooden Box Mine equipped with a metal detonator and an improvised German mine made of a plastic explosive wrapped in paper or cloth tied together with a string and provided with a bakelite detonator. When buried below one inch of soil, neither type could be picked up with our mine detector.

In the lava beds of the Mount Etna area, the M 1 detector failed due to the metallic content of the soil.

On several occasions, captured enemy documents furnished timely information on deliberate minefields and enabled our engineers to wire in and by-pass these known fields. On D plus 1, at an Italian Regimental C.P., a map was discovered that contained exact location and number of mines prepared in the Vittorio-Gela beach sector. About 90% of the information contained was accurate. Engineer units were materially aided by speedy dissemination of this information. In the Milazzo area, a German F.W. from a Pioneer Regiment gave accurate information as to local minefields laid by his unit.

The 17th Engineer Battalion was equipped with four Scorpions mounted on M-4 Tanks which arrived at Licata on July 14. Due to the rapid advance, this equipment never received an adequate test under battle conditions. No trailers and prime movers had been provided for these units and movement over mountainous roads proved slow and tedious. Tests showed that Scorpions "walked" over twenty miles wore out their bogeys and were unserviceable. During the Orlando-Milazzo advance, these vehicles were attached to the 3d Division Engineer for aid in clearance of heavy minefields encountered. After the long road march, the Scorpions arrived in poor condition and were not repaired until too late for adequate trial under combat conditions.

E. Camouflage:

Prior to the operation, a new type of garnished net was ordered for all T/BA vehicles of the Forces. These nets were 100% flat garnished with 70% sand and 30% green garlands. The reverse side of the nets were sprayed to give a total 75% green tone. This gave two-way reversible nets suitable for either sandy or green terrain. Each vehicle was authorized one such net of adequate size and a dump of 250 large-size nets was established at each of three main beach heads. The latter were used for concealment of beach stores. These nets were most satisfactory. They blended excellently with the terrain and troops made maximum use of them. Prior to the operation, Base Sections had been requested to "tone down" all stores packed in finished white packing cases. Those cases that did arrive with dull earth colors added materially in the concealment of small stock piles.

For shore operation camouflage, one platoon of Co. B, 601st Engineer Bn., was assigned to each Sub Task Force. These platoons were to arrive on D plus 4 to aid the divisions in camouflage of dumps and installations. Due to change in plans, only one platoon arrived in time and worked with the 1st Division Artillery. The battalion was later assembled in the Palermo area.

Camouflage and track discipline was generally good, particularly the artillery concealment. Toward the end of the campaign, due to rapid movement and lack of enemy air activity, there was a tendency to relax in dispersion and track discipline. Our air superiority permitted some latitude with regard to concealment in the selection of dump sites.

Late in the operation, a dummy railhead was planned. This included a dummy extension of the railhead from San Stefano to Caronia, involving the erection of three dummy bridges, and the erection of a dummy dump at its terminus; though work progressed rapidly no indication was received of its effectiveness due to the rapid completion of the campaign.

F. Water Supply.

The water supply plan for operation HUSKY was generally well carried out from the landing until the final successful conclusion of the campaign. Water was brought ashore in five-gallon cans and pumped ashore from bulk transport for the first five days' operation. At one beach of the Joss force, 40,000 gallons were pumped ashore to canvas storage tanks by 1030 of D day. Dime beaches did not attempt to bring bulk water ashore early in the operation, but made use of this method after D plus 2 at the Gela beach. In most cases, organic engineers had developed local supplies shortly after landing and actually much of the water brought in was not needed. On the moves inland, the organic engineers clearly demonstrated their ability under normal conditions to supply water to troops to which they are assigned and little difficulty was experienced in developing local supplies. With few exceptions, all city water distribution systems, where combat had occurred, were crippled or put completely out of service by bombing or shell fire. Effort was made to use city supplies as little as possible because of the shortages already effecting the cities.

Water supply troops assigned to sub-task forces luckily were not needed early in the operation as only one company arrived on schedule. This company was of great assistance in operating water points for Army troops in the Gela area and later came directly under II Corps control and backed up the Corps on its drive across the Island and up the coast to Messina. The other two companies, arriving too late, reverted to Army control without being of any use to their sub-task forces.

Only one well was drilled early in the campaign at the Ponte Olivo Airport. Since that time, several wells have been drilled for hospitals and staging areas in the Palermo area.

Water Supply for Hospitals - The furnishing of water for the 91st and 59th Evacuation Hospitals developed into a major project. The city water supply was on only during daylight hours, whereas the overcrowded hospitals required 24-hour service. Initially, at the 91st, two 3,000-gallon canvas tanks were erected on the roof of an adjoining building, piped to the plumbing system and filled from tank trucks. This water supplied the night demand and carried through until city water was turned on in the morning. In order to make the hospitals independent of the city system, wells were drilled both at the 91st and 59th. A 25,000-gallon wooden tank was being erected on the roof to replace the canvas tanks and a pipeline was run to the 59th. The 40lst Engr. W.S. Bn. operated these installations on a 24-hour basis.

It is impossible to accurately tabulate the actual amount of water used in this campaign, but it is estimated that the consumption averaged well over 2 gallon/man/day rather than the 1 gallon/man/day as planned.

Distillation units proved of little value in this operation and could well have been left off the list of necessary Engineer Water Supply Equipment. Large quantities of water supply equipment were abandoned by the enemy. A great deal of this equipment was picked up by units for their own use. Strategic Engineering Studies, prepared and distributed by the Chief of Engineers, proved to be accurate and complete, were at times indispensible, and in many cases possessed more information than the natives themselves.

IV. CONSTRUCTION

A. Roads and Bridges.

In general, main roads in Sicily were found to be in excellent condition. Surfaces were black top or waterbound Macadam, grades and curves normally easy, widths sufficient to accomodate two-way military traffic. Towns and villages provided bottlenecks with sharp curves and narrow streets. Bridges and culverts were so constructed as to support all military loads. Considerable road repair machinery such as rollers and portable rock crushers were found in many localities and stock piles of crushed stone and asphalt were distributed throughout the lengths of all main highways in sufficient quantities to take care of initial repair.

Second class roads were usually in fair condition, but curves were of short radius, grades were steep and widths so narrow as to be unable to support two-way military traffic. However, in most localities, the network was sufficient so that these secondary roads could be used to excellent advantage by making them one-way and controlling traffic circulation.

During the Sicilian campaign, the Germans demolished approximately 130 highway bridges and cratered the roads in approximately 40 places.

The conclusions drawn during the planning stage that blown bridges could easily be by-passed in dry weather proved true. Division and Corps Engineers had little difficulty in constructing suitable by-passes and holdups were not serious. Army Engineers moving in to take over main supply routes to Corps rear boundaries found roads and by-passes in excellent shape for the most part. Initial work consisted in removing road blocks, widening bottlenecks, repairing road surfaces and improving some by-passes.

Second phase work consisted in making by-passes all-weather by either building culverts to take normal flow and paving the slopes of fills or construction of wooden trestle bridging. Of three bridges blown between Palermo and Trapani, the 17th Engineers constructed one trestle bridge and one deep-fill by-pass with culvert on the Palermo-Lercara Friddi-Agrigento road. The 20th Engineers were charged with the improvement of some 18 by-passes on Route 113 between Palermo and Capo d'Orlando while the 343d Engineers repaired some 21 by-passes from Capo d'Orlando to Randazzo and Capo d'Orlando to Messina.

When the swing to the eastward was made, it was decided that it would be extremely advantageous to be able to relieve the road traffic by transporting supplies eastward by rail as far as practicable. The railroad was operative as far east as Cefalu. Reconnaissance of the road from Cefalu to S. Stefeno revealed 4 blown bridges and 1 blown tunnel entrance with considerable track repair necessary.

Reconnaissance of the railroad east of S. Stefeno showed 4 bridges blown in the first five miles and a total of 7 in twenty miles. Gaps were long, and it was not considered feasible to repair the road east of S. Stefeno in time to be of use.

It was decided, therefore, to repair the railroad to a point one mile west of S. Stefeno and establish a railhead at that point. The location selected was a junction of main supply routes to the 3d Division along the coast road and the 9th Division along Route 117 and 120. It was estimated that 1,000 tons per day could be placed at the railhead (Incl. #7). The blown bridges were repaired using wooden trestle. Notable about the repair of one bridge was the use of some prefabricated trestle bents located in the shipyard at Palermo. Considerable time was saved by their use. Also noteworthy was the repair of one bridge by the use of the Bailey bridge for railroad with additional decking for motor vehicles. While not actually necessary for operation, one bridge was also rebuilt using wooden trestle. The repair of these bridges opened up use of the existing siding in S. Stefeno for use as railroad water point at that end of the run. Repair of the railroad and construction of the railhead was accomplished by the 20th Engineers in such time as to permit a train to be sent through on August 9th.

The railroad in the southern sector was operative from Licata and Agrigento to Caltanissetta and eastward to Libertinia where a bridge was blown over the Dittaino River. On the road northward from Caltanissetta to Termini Imerese a bridge was blown at Sciara. To permit shipment by rail from the South dumps to Palermo, it was thought advisable to rebuild this bridge. The gap was 96 feet long by some 35 feet high. Parts for a prefabricated, bolted, sectionalized Austrian railroad bridge had been located near Roccapelumbe. The 343d Engineer G.S. Regiment was assigned the job of rebuilding this bridge using the Austrian Bridge. With no instructions and only a line drawing, they proceeded to solve the intricacies of erection and completed the structure in 7 days, permitting a train to cross on August 22d.

With the occupation of all airfields in Sicily by the NAAF, it became necessary to supply some 500 tons per day at Gerbini. The 343d Engineer G.S. Regiment was assigned the task of rebuilding the bridge at Libertinia using a double-double Bailey bridge to cross a 35-foot gap. This was accomplished in three days, the first train crossing on August 28th.

Through coordination of the Engineer, 7th Army, and AMGOT, provincial road authorities were put to work on the main highways for normal repair and maintenance and for permanent reconstruction of damaged bridges.

B. Bulk Fuel Storage.

Original bulk fuel storage plans called for the construction of two 5,000 bbl. tanks for V-100 gasoline at Gela with pipelines to Ponte Olivo and Comiso Airfields and two 1,000 bbl. tanks erected at each field. Some 20,000 bbl. storage for V-80 was also contemplated at this location.

Construction was started with levelling of the tank site on the afternoon of July 16 and tank erection commenced on July 17 with the arrival of materials. The first 5,000 bbl. tank, the eight miles of pipeline to Ponte Olivo and three 4-inch pier to Port, storage lines of approximately 2,000 feet each were completed and tested by July 21. This was accomplished in spite of the fact that one-third of the Pipeline Company was not disembarked until the night of July 18; that all connections, flanges, etc., had to be improvised because these critical items had not been shipped; and that such materials as did arrive were badly scattered along the Gela beaches, requiring a large percentage of the Company's time collecting the necessary parts for the installation.

Between July 21 and July 28, sufficient additional materials arrived to permit the following construction.

a. Two additional 5,000 bbl. tanks at Gela.
b. Twenty-two miles of pipeline to Comiso with three pumping stations.
c. Rehabilitation of Comiso storage and erection of an additional 1,000 bbl. tank.

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

The latter installation was not completed until August 5, due again to lack of materials.

With the rapid movement of the action westward, it was decided to change the location of the V-80 storage to Porto Empedocle. Existing storage of some 1600 bbls. was rehabilitated, an additional 5,000 bbl. tank erected and pipeline to pier constructed by July 31. This storage was later augmented by the Navy turning over two additional tanks totelling some 7,500 bbls. which were not needed for diesel.

The Agente Generale Italiano di Petrolio installation in Palermo was found to be in excellent condition, except that the main pumping station had been demolished by the enemy. Rehabilitation work was started on August 2, with civilian labor under Army supervision, and completed on August 9 after additional Pipeline Company personnel had arrived. Approximately 52,000 bbls. of gasoline storage and 23,000 of diesel storage was made available. A diesel tanker discharged into the installation on August 10.

To provide V-100 storage for Boccadifalco Airport, an additional 5,000 bbl. tank was erected at the Agente Generale Italiano di Petrolio farm and approximately one mile of pipeline laid to the airfield.

C. Port Reconstruction.

1. Gela - Initial port reconstruction was confined to the Port of Gela. A 200 ft. gap had been blown in the pier some 400 ft. offshore preventing use of the pier for vehicle unloading. The initial plan was to use a standard 175 ft. section of pontoon causeway with armored treadway ramps at either end to bridge the gap. When it became known that additional causeway was available, this plan was discarded in favor of utilizing the causeway as an entirely separate pier to a new beach exit road alongside the existing concrete pier. Two 175 ft. sections were joined, making a total length of 350 ft., the onshore section was beached as solidly as possible by bulldozer and a wooden ramp attached, the whole section being fastened by chain and cable to the existing concrete piers. Two additional 175 ft. x 14 ft. pontoon sections were secured to make a causeway 175 ft. x 28 ft. and fastened to the first sections at the offshore end to make an L-shaped structure. Because of a sand bar at the offshore east end of the causeway, LSTs were limited to a single birth adjacent to the existing pier. LCTs could use the additional pier space. To accomodate more LSTs, the pier was changed as shown on Inclosure #10. The new beach exit road was constructed of pierced plank matting. This work was done by the 1st Engineer Bn.

The Navy C.B.s constructed the pontoon causeway while the 531st Engr. Regt. removed underwater debris.

2. Licata - Porto Empedocle: No major repairs were necessary at either Licata or Porto Empedocle.

3. Palermo - The port of Palermo was badly damaged by operations of Allied aircraft. There was no attempt at deliberate demolitions. The entire area was covered with bomb craters and debris of surrounding buildings and port buildings. Considerable damage was done to quays and berthing spaces. The railroad pier was covered with burned-out cars and torn-up track. Many hulks were sunk at the piers.

Repair was initiated by the 20th Engineer Combat Regiment on July 23, the day after the capitulation of the city. The first consideration was to provide berths for LCTs, LSTs and coasters and ramps for DUKWs. Removal of debris, filling of craters, levelling of pier areas, and preparation of port exits received first consideration. Steps were cut in existing masonry piers to accommodate the ramps of LSTs. After initial repair was completed to permit docking and unloading wherever berths were available, ramps were constructed over sunken vessels and the superstructure removed to provide additional berthing space.

Later improvements consisted, in general, of improvement of the port area, removal of damaged structures, laying water lines to each pier, removal of minor underwater obstacles and general repair. No long-term program of repair was contemplated.

The 343d Engineer G.S. Regiment took over from the 20th Engineer Combat Regiment on August 1st and were relieved on August 11th by the 1051st Port Construction and Repair Group upon their arrival. The 540th Engr. Regt. (Shore) did some work in the area confined mainly to cutting ramps for LSTs.

The chronological record follows:

July 23 - Reconstruction commenced.
July 26 - First LCTs arrived.
July 28 - Coasters arrived.
July 29 - 1st Train from port.
Aug. 1 - 9th Div. LSTs and XAPAs arrived. 343d Engr. G.S. relieved 20th Engr. Combat Regiment.
Aug. 11 - 1051st Engineer Port Construction and Repair Group relieved the 343d Engineer G.S. Regiment.

D. Other Construction.

Upon capitulation of the city of Palermo, the establishment of 7th Army Headquarters in that city and the creation of main dumps in the vicinity, the work requests poured in. Bivouac areas were necessary, buildings required for headquarters, billets, storehouses, laundries, bakeries, ordnance maintenance shops, all needed repair. There was an immediate demand for power and utilities. Evacuation hospitals set up in unoccupied buildings at the Poly Clinic Hospital required screening, revision of plumbing and water supply.

Main supply routes were established throughout the city from port to dumps, and streets were opened up, cleaned of debris, craters filled, and work started on permanent repair. There were some 40 major breaks in the water system and a great many more in the sewer system which had to be repaired. The power situation was critical, as there was only sufficient water in the power reservoir for 30 days' supply and thermal plants capable of feeding the 70 KW grid at Palermo and Empedocle were damaged by bombing and not operational.

Main Supply Routes in Palermo - Initial clearing of the main supply routes was accomplished by the 540th Engineer Combat Regiment. The 343d relieved the 540th of this responsibility and remained in charge of the work until the 6625th Base Area Group assumed control. Prisoner of War labor, under troop supervision, was used to great extent. An officer of the 343d was placed in the position of Street Commissioner and reactivated the municipal bureau in charge of street repair and maintenance. All work was done under direct supervision of this officer and priority established for repair of Main Supply Routes with civilian routes a secondary consideration. For these later repairs, the Army aided by furnishing dump trucks to the civil authorities. In addition to street repair, the work of repairing sewers and water mains was coordinated and expedited.

Power Plants - The power company officials were immediately contacted upon establishment of 7th Army Headquarters in Palermo and all power operations came under control of the Engineer, 7th Army. The officials made a reconnaissance of the power system accompanied by an officer of the Engineer Section and a complete report on the system obtained with estimates of materials and time required for permanent repair. Immediate repairs to distribution lines were initiated and crews started on the work of cleaning up the thermal plants. Materials were made available to permit utilization of the remaining water in the reservoir by pumping to the outlet. With arrival of the 1090th Engineer Special Utilities Company, the rehabilitation of power plants at Palermo and Porto Empedocle was placed under their control. Instead of the stipulated two months required for repair, the Utilities Company promised operation of the Palermo plant by September 1st and the Empedocle plant shortly after.

Steps were taken to get small diesel power plants at Gela, Trepani, Licata, Caltanissetta and Racalmuto into operation to supply local power needs and permit cutting these cities off the 70 KW grid.

Staging Area - The largest project was the construction of a 15,000 man staging area. This project was assigned to the Base Area Group under supervision of the Engineer, Seventh Army. Maximum use was made of captured material. The basis of design was a tent camp with semi-permanent kitchens, mess sheds, bath houses, pit latrines, dispensaries and administration buildings.

V. SUPPLY

A. General - Little difficulty was experienced in meeting our needs for essential supplies. The situation was considerably aided by the availability of a large amount of captured enemy materials. In the case of equipment, however, some items proved lacking and others were not available in the necessary numbers. A recommendation regarding the necessary changes in T/BA is included under "Lessons Learned".

B. Critical Items - Two items proved to be critical, Bailey bridges and bulldozers.

The loading of the Bailey bridges for the assault and follow-up convoys was not properly supervised, with a consequence that items loaded on any particular ship did not provide complete units. The situation was aggravated by the fact that the ships were landed on various beaches widely dispersed and often on beaches other than those for which they were scheduled. Consequently, it was a tremendous problem to assemble the bridges in complete units and to have them available according to the original schedule.

To correct this situation as quickly as possible, two complete bridges were requested to be delivered in Licata already truck loaded on LSTs. These arrived in fine style, although in Palermo, instead of Licata, and were moved directly from the port to the bridge site without delay. Later on, deliveries of Bailey bridges on coasters arrived in good shape, so that there was an ample supply on hand in the forward dumps when the campaign closed. An additional ten were in reserve, five being enroute when the campaign closed.

Bulldozers - The R-4 angledozer proved inadequate for the work required of it and had to be replaced by heavier D-7s and D-8s. Fortunately, several of our units already had some of these heavier dozers, but the attrition by mines became high and aggravated the situation. This condition was relieved by pooling and by transfers between units, including aviation engineers, who were most helpful and cooperative.

C. Loading of Supplies - The rapid accumulation of supplies from numerous widespread sources and the lack of detailed information on ship arrivals and departures prevented a comprehensive plan for the loading of engineer supplies.

D. Operational Beach Dumps - Previous to mounting the operation in Africa, one platoon of the 462d Engineer Depot Company was broken up into detachments and attached to the Shore Regiments of each force.

Since the Cent force was mounted in America, its detachment was assigned to the Dime force. Initially the Engineer beach dumps on the Cent beaches were operated by personnel of the Shore Regiment. Considerable confusion occurred on the beaches and in the dumps of the Cent force, much equipment was scattered and considerable time elapsed before it could be consolidated and inventories made. This demonstrated conclusively that the Shore Regiments need the help of trained Engineer Depot personnel.

Supplies stored in the beach dumps consisted solely of Class IV tactical supplies. These beach reserves consisted of tools, lumber, demolition supplies, field fortification supplies and camouflage materials. The amounts proved adequate. Stock records maintained consisted of a simple listing of items and quantities on a sheet of writing paper. As items were received or issued, quantities were erased and new entries made. To provide a record of supplies used, all supplies issued were listed on a tally out showing receiving unit and quantities drawn.

About D / 5 new dump sites were selected which were closer to the main road net and more accessible to the ports which by that time were taking the bulk of the tonnage unloaded. New dump sites were picked at Gela and Licata and later at Porto Empedocle. The beaches at Scoglitti were closed out because of lack of port facilities. The new dump sites were picked with the thought in mind that they would be more or less semi-permanent. It was necessary, therefore, to pick areas that would permit a great deal of expansion. No covered storage space was available in any of the suitable areas and since it was not contemplated that Class II supplies would be stored in any of these dumps none was constructed. The stock records were set up on regular stock cards and tally in's and tally outs were prepared for incoming and outgoing shipments.

A definite need for certain Class II items developed in the earlier phases of the operation, particularly in Artillery fire control and calculating sets. A special small mobile stock of Class II items should accompany an early follow-up in depot vehicles. About D / 12 some Class II supplies began to come into the dump in Gela. Because of the lack of covered storage space and insufficient personnel to run a separate warehouse, it was necessary to evolve an efficient and safe system of handling these supplies in open storage. Boxes of Class II supplies were opened, and inventoried, numbered and a careful record kept of box and contents. The boxes were nailed up and stacked according to number. As each item was posted to the stock record, the corresponding tally in number was also posted. With the above system it was possible to look up any item on the stock card and determine the quantity on hand and its location in the dump.

E. Operational Base Depot - On D / 12, the remainder of the 462d Engineer Depot Company arrived in Licata. The company was sent immediately to Palermo to open a base depot. An excellent site was selected in Palermo with rail siding, twenty acres of open storage space, seventy-five thousand square feet of brand new, camouflaged warehouse space and additional motor vehicle sheds sufficient to accomodate the 469th Engineer Maintenance Company.

The depot company had about four days to prepare the depot for stock during which time an orderly and efficient depot was established.

Stock records were kept on improvised cards about 8" x 12" with space for the nomenclature and unit, and columns for dates, voucher numbers, receipts, issues and balance. The regular tally-in and out procedure was used.

F. Operation of Engineer Supply Section - In order to fill requisitions received from the front, it was necessary to have in the Engineer office an up-to-date and accurate record of stocks available in the base depot and each of the dumps. This was accomplished by daily change of status reports from the depot and each of the dumps. These status reports listed only those items on which there were any issues or receipts during the twenty-four hour period and gave the old balance, amount received, amount issued and new balance. The new balances were posted to stock cards in the Engineer Office which showed in separate columns the balance in the depot and each dump. The above procedure greatly facilitated supply.

G. Engineer Maintenance - The fact that numerous makes and models of mechanical equipment are issued under a single nomenclature, combined with the necessity of ordering three months in advance of need, made the maintenance of complete stocks of spare parts in the Base Area depots impractical. A requisition for spare parts sufficient to maintain the equipment of units tentatively assigned the Force for a period of six months, was submitted to SOS NATOUSA during the last week of May, for delivery to North Africa by 15 August 1943.

SECRET

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

In order to bridge the gap between D day and the arrival of the convoy, the third week in August, two steps were taken:

1. Units were reminded to carry their complete allotment of organizational first and second echelon spare parts. It was expected that this would carry them until the arrival of the 469th Maintenance Company on D + 30.

2. The 469th Engineer Maintenance Company was required to carry in their organic vehicles all available additional stocks of spare parts which were to be amplified by early deliveries on coasters of the necessary items not available by the time of their departure in order to provide sufficient maintenance of all equipment within the force for an additional 90 days.

Lack of shipping in the first convoys practically nullified preparations listed as step 1. Many vehicles carrying spare parts were assigned low shipping priorities because they were considered non-operational. Step 2 did not work out satisfactorily because too broad coverage was attempted. The carrying of large stocks of spare parts for equipment constantly in use to the exclusion of parts for equipment not likely to see hard service would have worked more satisfactorily.

Often, after equipment had been destroyed by mines, units made a partial cannibalization for parts which they did not actually need at the time. This deprived the Heavy Maintenance Company, which completed cannibalization of these units, the supply of which was often critical.

Bowl pins on bulldozer blades broke frequently during heavy service. A large number of bulldozers were damaged by enemy mines. The most usual damage occurred on the tracks and the rollers, although in several cases the under part of the engine was ruined and in other cases the final drive assembly and the frame legs were blown to pieces. The stock of many of the parts involved was limited because of the size of the parts, and the only solution to this handicap on the battlefield is cannibalization.

Considerable difficulty was had with flat bed trailers on tires, tubes, rims, wheel bearings, and brake parts. In many cases, the damage was due to the inadequacy of the vehicle for its mission; however, numerous failures of 16-ton trailers loaded with D-7 tractors indicated that many of them were caused more by mishandling than by inherent weaknesses. Below recommended air pressure in tires and excessive speeds caused most of the failures.

Magnetos, engine starters and spark plugs as well as oil and air filters, fan belts and hydraulic oil pumps for hydraulic bulldozers and graders have a high premium. Hydraulic lines on bulldozers and road graders, clutches on graders and the main clutch on bulldozers are easily broken.

H. Handling of Captured Engineer Equipment.

In the southern area, one officer from the Engineer section of the 6615th Base Area Group was detailed to reconnoiter the southwestern part of island for the purpose of locating and inventorying enemy Engineer material. This officer visited every major town and covered all of the main road nets. A list of supplies, location and organization or persons controlling them, was compiled. It was found that the Civil Affairs Officer in each town was one of the best sources of information on supplies, both military and civilian in any locality. Supplies which were found unguarded were reported to the nearest unit commander or the local Civil Affairs Officer and guard requested.

Due to the shortage of truck transportation, it was not possible to haul all of the material located into Engineer dumps. A great deal of this material was disposed of by sending units needing supplies directly to the captured material rather than drawing from the Engineer dumps. Material for which there was an immediate and continual need was hauled into the Engineer dumps as fast as transportation facilities permitted.

Lists of captured material were furnished periodically to the Engineer, Seventh Army, giving the location, quantity and condition of captured material. These lists were used for filling requisitions.

In the vicinity of Palermo, a great deal of enemy material was captured in warehouses that were needed for storing American supplies, and consequently had to be moved into the Engineer Depot. Wherever practical, captured supplies were left in their original location and placed under civilian or military guard. Material was then issued direct to using units. Priority in moving was given to those supplies for which there was an immediate need. All enemy dumps reported on situation reports from Army units were listed, and were later investigated and inventoried.

Mechanical equipment such as cement mixers, generators, air compressors and similar equipment were brought into the depot and reconditioned by the 469th Engineer Maintenance Company and put to work on port reconstruction, utilities work and often issued to units rather than American equipment. The 105ist Port Construction & Repair Group and the 1090th Engineer Utilities Company had not received their T/BA equipment from North Africa, and they were equipped almost entirely with captured equipment. Almost all equipment captured was in excellent condition. With the exception of searchlight units, very little of the mechanical equipment had been sabotaged.

The salvage of captured searchlights and sound detection equipment was turned over to the 62d C.A. This organization hired several civilian searchlight experts and was able to get several units in operation.

Large stocks of pioneer tools were captured in Palermo. Although of poor quality and not altogether satisfactory as substitutes for T/BA tools, they were of great value for prisoner of war labor. About 1,500 shovels and 1,000 picks were captured, most all of which were issued.

I. Fiscal.

The extensive repair, particularly in the Palermo area, and the operation of the Engineer Depot, required the employment of a large number of civilian laborers. These employees were paid according to the wage rates established by the Commanding General, Seventh Army, using an eight hour work day and a 48 hour week. They were paid time and a half for all overtime in any one day and were paid weekly.

It was also necessary to expend funds for the purchase of necessary local supplies.

VI. REAL ESTATE

The real estate section began functioning in Palermo on July 26.
The original objective of the section provided for a central agency for control in the requisitioning of real property to be taken over for the use of 7th Army and attached units. A directive published prior to the operation provided for the acquisition of real estate by the unit desiring the property followed by a requisition submitted by the unit concerned. However, in order that all records of property could be kept in a central office, the Engineer assumed this function. This central office requisitioned all property required by 7th Army units in the Palermo area and acted as a clearing house for all requests of subordinate units.

An effort was made to collect sufficiently detailed records to assist in setting up fiscal records if and when payments are to be made and to provide necessary data to a probable claims commission in order to facilitate adjustments of claims against the Army. To do this, it was necessary to have records as to dates of occupation and vacating property, condition of property before and after occupation and complete and comprehensive inventory of all movable property on the premises upon occupation and when vacated.

The personnel of the section consisted of two officers, one clerk and one interpreter. A card file was set up to include (1) properties requested but not requisitioned (2) properties requisitioned but not vacated, and (3) properties vacated. A work sheet was set up on each property in which the Army had any interest. The work sheet included in chronological order any matter of importance pertaining to that specific property. All allied papers were attached to the work sheet to form the complete file.

A total of approximately 225 requisitions were completed and 150 requests were being processed when the Base Area Group took over.

Difficulties were encountered due to lack of available public records, and looting of public and private property by civilians prior to occupation by allied forces.

VII. MAPS

A. Map Supply and Distribution.

1. Distribution prior to the landing.

The map depot was established at Constentine by the two map depot detachments June 5. Bulk maps for initial issue to troops and for Army reserve began to arrive at the map depot immediately. However, in the early shipments, coverage was by no means complete even for the initial assault area. Complete coverage did not arrive until after June 25. This made the work of making the initial breakdown extremely difficult. With the help of the Survey Directorate, AFHQ, the breakdown to units was made and delivery to ships and staging areas was begun on D-11 only and completed on D-1, four days prior to sailing. Delivery of maps to assault units was completed D-8.

The initial issue to troops covered only the area of the initial objectives. Small map depot detachments were attached to each division to carry a 20% replacement for the initial area and division coverage for the immediate areas beyond. These detachments were to consolidate and their stockage was to be reinforced by a bulk reserve shipment by D plus 4.

The maps arriving with the units mounted in America were slightly different in coverage and in some cases in edition than those provided by Survey. These units were therefore given a supplementary issue to make up for this difference in the initial assault area. Reserve stocks remained on the ships to be unloaded on the far shore.

2. Distribution during the operation.

After the landing, the operation moved so rapidly that remapping became necessary by D plus 5. At this time, consolidation of the depot detachments and stocks had not as yet been made and the stocks unloaded with the 45th Division were just being collected in dumps behind the beaches. It was only by the extreme efforts of all concerned that the units were mapped in time.

During the succeeding days, two depots were set up in Gela, but the depot detachment's transportation did not arrive until early in August. The Army continued to map the divisions, but because of lack of transportation, it became necessary for divisions to call at the depot for bulk issues. Soon after the Army Headquarters was established in Palermo, the Map Depot moved there.

A critical situation developed when the drive turned to the East toward Messina, and the II Corps was heavily reinforced, particularly with artillery. The units were operating in a comparatively confined area and new units were moved in suddenly without warning. A temporary solution was affected by providing the II Corps Engineer with a stock of 500 copies of all sheets within the area of projected operations. It was planned because of the indefiniteness of the situation to reinforce those with bulk deliveries as the need arose. This became necessary when the 9th Division was attached to the Corps, and it became necessary to fly the additional maps over from North Africa.

3. Maps Supplied.

a. Small Scale maps: GSGS 2758, 1/M. Colored topographic strategic map.

b. Intermediate Scale: GSGS 4230, 1/250,000 (Army Air). In seven sheets this colored map gave fairly good detail. However, it was little used although suitable as a roadmap and available in quantity.

c. Medium Scale: GSGS 4164, 1/100,000. This was a multicolored map of good accuracy, and it was the largest scale map having complete coverage. It was widely used as a situation map, road map, and topographic map.

GSGS 4229, 1/50,000. This map had a brown monochrome base with blue grid and stream and red road overprints. It was used by all arms as a basic map. The fact that complete coverage was not available was a distinct disadvantage. The map was of good accuracy both in detail and contour.

d. Large Scale: GSGS 4228, 1/25,000. This map was printed in the same style as GSGS 4229 except that the grid appeared in the base color. Complete coverage was not available. It was widely used by all units whenever coverage existed.

e. Map Substitutes: Series AF - No91 Photomap 1/25,000. This covered the initial assault area only, was poor in quality and had blank areas in many sheets due to inadequate air cover. It was not used to any appreciable extent.

Beach Mosaic, 1/10,000. This photomap showed the area of assault beaches only. Of fair quality it was used by some troops on the initial landing.

f. Special Maps: Roadmap, 1/500,000. This was a hastily compiled multicolored road map. Lacking in detail, its advantage lay in showing the island in one chart. It was not gridded, which proved to be a disadvantage.

Roadmap, 1/200,000. This map was issued to the 45th Division before embarking in America. A multicolored map in three sheets, it showed great detail and was easily read. It proved a very desirable map, although available only in limited quantities.

Water Resource overprint, 1/100,000. This overprint showed all known and probable aqueducts and wells, and was invaluable to water supply and engineer units.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

Town Plans: Plans of nine principal towns were available, including a photomap plan of Gela. Town plans proved indispensible and the photo town plan proved an adequate, though not a preferable substitute.

Defense overprints were provided for defended portions of the coastline. These were used in last minute planning and in some cases in the assault.

4. Map Depot Personnel.

In order to effect the map distribution two map depot detachments, each of one officer and twelve EM were hastily formed early in June. These units proved inadequate both in organization, personnel and equipment.

B. Employment of Topographic Units.

1. Survey Sections.

1st Survey Section of the 62d and 66th Engineer Topographic Cos. (Corps) were available during the operation. Control available in the area was extremely scarce and confined principally to the primary triangulation nets.

Because of the scarcity of known control, the Engineer Survey Platoons were attached directly to the Artillery sections of II Corps and 3d Division respectively. Early in the operation, an attempt was made to provide artillery with survey tied to basic control. The advance soon became so rapid, however, that survey could not keep pace and was given up temporarily. Fortunately maps proved of sufficient accuracy for use as firing charts.

After the fall of Palermo, both survey platoons were attached to II Corps Artillery. At this point, the front was somewhat stable and survey was resumed. Survey was confined almost entirely to fourth order triangulation from short bases tieing to recovered map and control data when possible.

2. Photomapping and Reproduction Sections.

The 62d Engineer Co. was assigned directly to II Corps and worked under their direction throughout the campaign. The 66th Engineer Co., less the Survey Platoon, was assigned to Army and operated from North Africa. It was employed in printing defense overprints and filling gaps in map stocks.

Early commitment of the 66th to the printing of defense overprints, which it was planned to prepare in North Africa until D plus 12, prevented the unit from being transported to the Island in the early stages. Later, shipping became a premium and the unit never reached Sicily. However, several times the unit was required to print maps to be flown to Sicily.

3. Photo Interpretation.

Prior to the operation, the Engineer requested that an engineer photo interpreter be assigned to the engineer section. This officer did not arrive and on July 17, at the engineer's request, an officer was attached from 15th Army Group for this purpose. During the operation, this officer remained with the G-2 photo interpretation unit at Ponte Olivo airport. All sorties flown were interpreted for engineer intelligence daily and the reports dispatched each morning to Corps and Army by sub plane. The reports included the location of river crossings and defiles, enemy demolitions and the possible work required for bypassing, and the location and photography of minefields.

The reports, although received regularly by the Corps Engineer 48 hours after the flight and although accurate as to location and extent of demolition, were of little actual value to Army, Corps, or Division engineers. In practically every case the reports reached Corps and division after more accurate ground reconnaissance had been made. The estimates of work required varied greatly from actual practice. The location and plots made of two minefields were found to be accurate and proved of assistance in lifting the fields although in both cases they were in rear areas.

VIII. CONCLUSIONS

A. Planning -

1. An adequate staff must be available immediately to permit the detailed study of all possible needs. For an operation of this size organized with a Base Area Group as an integral part of the command, an Engineer staff for a reinforced corps is adequate if supplemented by a few key members of the Base Area Group and, for short periods of the planning stage, for detailed technical advice, by liaison officers from special engineer units. Requirements for troops and supplies needed in a planned operation must be based upon a reasonable amount of experience and knowledge of the responsibilities of the various organizations as well as the capabilities of the various troop units, their personnel, and equipment and the supplies required to permit efficient operation in the field.

2. Critical items of Engineer Class IV Supply require at least ninety days between requisition and delivery. The mission must be defined in ample time to complete plans whose execution demand these items.

B. Training -

1. Complete coordination must be effected between the Army and the Navy early in the plans and training period. Such coordination can best be accomplished by the creation of a joint Army-Navy board organized for a sensible and amicable solution of mutual problems.

2. Experimentation must be completed prior to the commencement of the training period, or failing that, be conducted by troops other than those involved in the operation. By this is meant primarily, innovations in landing methods, passage of obstacles, and related subjects.

3. The training program preparing troops for active operations must not be interrupted or interfered with by numerous demonstrations that disrupt training schedules involving both services and take valuable time from training periods.

4. Components of beach groups must be assembled early to permit the coordination necessary for efficient operation. Even under the best of conditions, considerable confusion on the beaches during early stages of the landing is inevitable. Each component, regardless of size, must be properly trained and adequately controlled to insure its efficient functioning as part of the beach group. Sufficient time, therefore, should be provided to properly establish standard operating procedures, and develop necessary teamwork. This applies particularly to Military Police who are to control traffic across mined beaches.

5. Realism in training is essential regardless of the risk to personnel and equipment. Unless some attempt is made to reproduce enemy action and erect obstacles likely to be encountered, any training will fail in the principal aim of preparing each soldier to meet any eventuality.

6. Mine training, including the operation of the detectors, must be given to all branches of the service. The greatest menace of mine warfare is the mental fear it creates. Familiarity with mines will soon dispel this fear. In addition, proper training of other branches in mine detection and removal will eliminate the unreasonable demands now being made on engineer troops to accomplish this often simple mission.

7. Care in the placing of obstacles, particularly barbed wire, in front of well camouflaged fortifications is important. We encountered many exceptional examples of camouflage of fortifications, but in many cases the value of the camouflage was lost because the locations were given away by the barbed wire around them and by lack of track discipline.

C. Loading of Supplies -

1. Control of the loading of personnel, supplies and equipment should not be too greatly decentralized. It is true that division of the parent force into numerous commands places initial responsibility upon sub-task force commanders, which should permit to a certain degree his absolute decisions as to loading of personnel and supplies. The possibility of assumption of control at an early date by the higher headquarters, however, demands adequate control to insure proper arrival of troops and supplies based on the overall picture. The advisability of the task force retaining a small part of the shipping space provided each sub-task force until all last minute requirements are known should be considered to provide for unexpected late demands on the task force as a whole.

2. Loading of items of a complicated or highly technical nature must be supervised by personnel capable of identifying parts and who realize the necessity for orderly placement on shipboard. For instance a Bailey bridge lacking an essential part might better remain on the dock in a base area than take up valuable space on a transport.

3. Prime movers and trailers must be loaded on the same craft with the equipment they move. Valuable time is lost in the preparation of beach roads and dumps if the tractors of shore regiments are used as prime movers in the unloading of LCTs and LSTs.

D. Landing -

1. Engineer personnel with mine detectors or personnel trained in probing (a ramrod is good in the sand) must precede vehicles coming ashore. Mines were encountered on practically all beaches, and valuable equipment was lost because of a failure on the part of beach groups to properly provide for their removal prior to the arrival of motor equipment.

2. Adequate traffic control personnel and a large quantity of signs should be landed early. Considerable confusion must be expected in the landing of large numbers of vehicles and quantities of supplies on an unfamiliar beach. This confusion can be eliminated and traffic channeled to follow mine cleared lanes only by proper signposting and control of traffic.

3. Centralized control of unloading and the consolidation of supply dumps should be effected at the earliest possible moment consistent with tactical needs, even preceding the assumption of command by the Task Force.

4. Beach markers must be simple. The extensive use of Dukws has particularly made this mandatory. Flank markers to define the limits of the beach, landing point markers and road exit markers for vehicle and Dukw drivers are all that are required.

5. Beach groups should operate in support of Sub-Task Forces rather than under assignment or attachment. This is necessary to eliminate a great deal of interference on the part of staff personnel with the operation of the beach units.

6. Better means should be provided to insure control of shipping off shore. Supplies carried on the ships are needed by the units ashore, and the points to which they are delivered should be determined by those for whom the supplies are intended. Otherwise, as in the past operation, supplies will often be landed distant from the point where they are required.

7. In the unloading of supplies the Dukw has proved an exceptionally fine piece of equipment and has accentuated the importance of bulldozers on the beaches early in order to properly construct the necessary roads, and it has also made the sleds previously used by the shore units obselete.

E. Operations -

1. Sufficient transportation should be furnished the engineer headquarters section to permit close liaison and supervision of the varied and widely separated engineer works.

2. Photo interpretation by a trained officer is of great value in the planning of combat engineer work in the forward echelons. Although photomaps have not been received with complete favor by the combat elements, information that has been provided units daily from interpretation of aerial photographs from an engineer point of view by an expert has been of value in giving advance information on minefields, sites for possible demolitions and defensive installations. This necessitates early and continued coverage. Minefields must be picked up when or shortly after they are laid and before action of the weather eradicates the traces. They should be reported prior to the time advance units enter the area to be of special value. The report of probable demolition sites together with a description of possible bypass sites delivered well ahead of the front line would be of value in planning. To receive the full value of the report, photographs of the site must be in the division engineer's possession, although they need not show the actual demolitions.

3. It should be made clear to civilian agencies with the task force that they must work thru the task force engineer as long as operations require.

4. All personnel should have a greater appreciation of the value of maps. Unreasonable requests for maps during the operation probably resulted because initial issues were generous, giving the impression that maps were available to be expended as desired.

5. Subordinate unit commanders must be made to appreciate their responsibilities in supervising the inventories of the contents of private properties they occupy.

F. Organization -

1. An organization trained in the nomenclature, care, transport and erection to handle the Bailey bridge as a heavy ponton company does the ponton bridge is highly desirable. Perhaps the same unit could be trained to perform this dual mission, depending on the terrain encountered. This has been made the subject of a separate communication to higher headquarters and will not be covered here. A recommended T/O is attached as inclosure #3.

2. There is a definite need for a mobile map depot company or similar organization. One of the most vital functions of the engineer during the operation has been the supply of maps. The volume, because of the unexpectedly large number of troops concentrated in a small area, has been tremendous. In many instances additional personnel was required to assist the small map depot detachments in the sorting, packaging and issue of maps. In addition, with a rapidly moving force, the map supply must be mobile so that maps are steadily available when and where called for. A recommended T/O is attached as Inclosure #4.

G. Supply and Equipment -

1. All major items of engineer equipment must accompany units on their initial landings or on an early convoy thereafter. Engineers require their specialized equipment to accomplish normal missions of road repair, and the

SECRET

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

construction of bypasses and bridges. Lack of this equipment obviously reduces the efficiency of these units, and further, may make it impossible to perform the role for which organized. It is difficult to sell the idea that engineers are just as impotent to fulfill their mission without their equipment as would be artilleryman without their field pieces. This applies particularly to angledozers, trailers and prime movers.

2. Bailey bridges should be available early in the operation in terrain the nature of Sicily. Upon the ability of the engineers to rapidly bypass or repair demolished bridges depends the rapid progress of the artillery and other equipment and of the operation as a whole. Since the rate of progress cannot be accurately predicted, this can be just as essential in the early stages as at any later time. Adequate facilities to accomplish this mission should be available from the beginning.

3. Additional end pieces for Bailey bridges should be provided in this type of terrain. This need is obvious when it is realized that the greater number of bridges erected have been in lengths of less than the bridge unit of 120'.

4. Services must be informed at the earliest possible date of available ship tonnages for supplies on each convoy.

5. A special small stock of Class II Items should accompany an early follow-up in depot vehicles.

6. Our present T/BAs do not provide adequate equipment to meet the present day demands for speed.

H. Engineer Maintenance. -

1. The greatest over-all benefit can be derived from equipment wrecked on mines if units are prevented from extracting parts other than those actually needed at the time and are required to report such equipment promptly to the maintenance company for cannibalization.

2. Provisions should always be made for at least a detachment of units equipped with repair and shop trucks with loose tools to accompany the equipment on any move. Otherwise, even locked tools will be pilfered.

3. The components of echalon sets are sound, but provision must be made to supply all the parts necessary to complete each set.

IX. RECOMMENDATIONS

A. The immediate assignment, upon receipt of first planning directive, of the complete engineer staff plus key personnel of the Base Area Group, if the latter is to be an integral part of the command.

B. The early creation of a joint Engineer Army-Navy planning board.

C. The early assemblage of the components of beach groups, regardless of size.

D. Realism in training.

E. Adequate mine training for all branches of the service.

F. Bailey bridge training for all engineer combat and general service units.

G. The limitation of decentralization of the loading of personnel, supplies and equipment.

H. The supervision of loading of technical engineer equipment and supplies by engineer personnel.

I. The simple ship loading of prime movers and their trailers.

J. The early loading of engineer personnel with mine detectors.

K. The centralization of control of unloading and consolidation of supply dumps at the earliest possible moment.

L. Simplification of beach markers.

M. The operation of beach groups in support of, rather than under sub-task forces.

N. The supply of aerial photos covering the Division route of advance well ahead of the front lines.

O. The organization of Bailey Bridge Companies.

P. The organization of Engineer Map Depot Companies.

Q. The loading of all major items of engineer equipment with the unit.

R. The provision of additional end pieces for Bailey Bridges.

S. The changes in T/BA enumerated in Inclosure #11.

GARRISON H. DAVIDSON,
Colonel, C. E.,
Engineer.

I. ASSUMPTIONS

1. This plan will probably have to be modified depending on the availability of shipping.

2. It is assumed that the tactical operation will develop into four phases as follows:

a. 1st Phase, D to D plus 8. Assault to capture a bridgehead extending roughly through Ragusa, Vizzini, Caltageroni, Mazzarino, and Campobello.

b. 2d Phase, D plus 8 to D plus 15. Extension of bridgehead by western assault force of Kool force to include Agrigento and Porto Empodocle.

c. 3d Phase, D plus 15 to D plus 30. Movement to north by Cent and Dime to protect the left flank of the British in their advance on Messina.

d. 4th Phase, after D plus 30. Final reduction of western part of Island.

II. MISSION

1. In addition to their normal missions, engineer units will be assigned the following:

a. Operation and improvement of beaches and initial ports.

b. Repair of a coastal crash-landing strip, two airfields and an inland landing strip.

c. Construction of bulk fuel storage.

2. During the initial phase, all engineer missions must be accomplished by engineer troops of the D and D plus 4 convoys under supervision of the sub-task force commanders (engineer).

3. When Task Force 343 takes contro, the 1st Special Brigade

3. When Task Force 343 takes control, the 1st Special Brigade will function as the Task Force Supply Agency between the shore line and the division dumps except for the supply of water and maps.

4. The Engineer, Force 343, will assist in this by the repair, clearance and maintenance of the lines of communication between the rear boundaries of subordinate units and the line of dumps established by the 1st Special Brigade which initially will be near the beaches.

III. TROOPS

1. The Engineer Section, I Armored Corps, Reinf., will be organized as follows:

ENGINEER
Col. Davidson

EXECUTIVE
Lt. Col. Chambers

ADMIN.	MAPS	OPERATIONS	SUPPLY	CONSTRUCTION
Lt. Van Aken	Major Webster	Maj. King	Major Gaynor	Lt. Col. Eller
	Lt. Lee	Maj. Miles	Capt. Hilleke	Communications Man
	Photo Interpreter	Capt. Trygg		
		Lt. Rogers		Utilities Man

2. For the operation and improvement of beaches and ports, all engineer units of the beach group will operate initially under direct control of their respective task-force commanders (engineers). They, and the necessary engineer service units, will pass to control of the 1st Special Brigade when all supply activities are taken over by the Commanding General, Force 343. Additional service units will be under the control of the 1st Special Brigade upon arrival. These include:

a. 437th Engr. Co. (D.T.) (less 2 Plat)
b. 462d Engr. Co. (Dep) (less 1 Plat)
c. 343d Engr. Regt. (G.S.)
d. 469th Engr. Co. (Main)
e. Det., 6th Engr. Plat. (F.F.)
f. 2657th & 2658 Map Dep. Det. (less Det.)
g. Co. "B", 601st Engr. Bn. (Cam) (less 4 Plat)
h. Det., 8th Engr Plat. (F.F.)
i. 401st Engr. Bn. (W.S.) (less 3 Co)
j. Hq & Hq Co., 105lst Port Repair Co.
k. 1090th Spec. Utilities
l. 402d Engr Bn. (W.S.)
m. 387th Sep. Bn. (Cld)

3. When Task Force 343 assumes control, the following units will revert to its control for combat operations.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

a. 20th Engr. Regt. (C)
b. 401st Engr. Bn. (H.S.) less det.
c. 4 Plats., "B" Co., 601st Engr. Bn. (Cam)
d. 66th Engr. Co. (Topo) (less Survey Plat.)
e. 175th Engr. Regt. (C.S.)
f. 427th Engr. D.T. Co.
g. 376th Sep. Bn.
h. Co. "A", 85th Hwy Ponton Bn.

4. The following installations should be captured intact by the respective sub-task forces and preserved.

a. Railways

(1) At Licata - Sheet 271 (940340) 1:100,000
Depot and water and workshops adjacent thereto.
Priority.

(2) At Comiso - Sheet 276 (535165) 1:100,000
Depot, Water, and Workshops.

(3) At Canicatti - Sheet 267 (860820)
Depot, Water, and Workshops.

b. Thermo electric generating stations

(1) Coal.
Porto Empedocle - Sheet 271 (555585)
10,000 KW.

(2) Diesel
Agrigento - Sheet 271 (630570)
1020 KW.

Gela - Sheet 272 (220300)
260 KW.

Licata - Sheet 271 (940340)
175 KW - 2100 volts.

c. Bridges

(1) RR bridge at Licata - 0.5 km. S.E. station over F. Salso.

(2) Highway bridge at Licata - 100 yes upstream from RR bridge. Over F. Salso.

(3) RR bridge 3.3 kms. East of station at Ragusa.

(4) Highway bridge - Ragusa-Modica road, 3-1/2 mi. from Ragusa.

(5) RR and highway bridges over F. Gela about 1 mi. East of Gela. Sheet 272 (236297).

(6) Highway bridge over F. Ippari at Vittoria.

IV. CONSTRUCTION PLAN

Policy.

The policy of Force 343 for construction will include only those works which are considered absolutely essential for military needs. Because of limited shipping lift methods of construction must be used which will require the maximum use of available local material and minimum use of materials and supplies which must be shipped in.

Construction common to all Sub-Task Forces.

The normal Engineer missions are common to all sub-task forces. These include

1. Repair and maintenance of lines of communication.

2. Field fortifications and beach defenses.

3. Prisoner of war inclosures.

4. Construction of limited covered storage for perishable supplies.

A limited amount of materials and supplies for these operations have been set up to arrive at an early date including bridging, sand bags, wire, pierced plank for improvement of beach roads, tentage for depots and a limited amount of railroad material.

Local materials will be used to repair the roads but a small amount of bridging will have to be taken to repair some of the critical bridges that may be destroyed. In general, streams may be crossed without the bridges by detouring, using natural fords, or cutting the banks down. It is estimated that the JOSS force will need about 160 feet of bridging, the DIME force about 430 feet, and the CENT force about 280 feet with an average depth of about 15 feet.

The following are specific missions assigned each sub-task force. They will be relieved of these responsibilities when the 1st Special Brigade or the Aviation Engineers can take over.

Shark Force Special Construction.

1. Repair of airfields and landing strips.

a. As soon as captured to repair the runway at Comiso airfield or construct a substitute runway to be available for operation not later than D plus 8.

b. As soon as captured to repair the runway at Ponte Olivo airfield or to construct a substitute runway to be available for operation not later than D plus 8.

c. When taken, to construct a landing strip at Biscari landing field.

2. Repair of jetty at Gela.

a. The existing 1050 feet jetty should be repaired as soon as is possible for use in unloading vehicles from LSTs and to accommodate a shallow draft tanker.

3. Bulk Fuel Storage.

a. The requirements for aircraft and vehicle gasoline will exceed 1000 tons per day. To relieve the congestion of the beaches and the necessity for handling gasoline in cans bulk fuel storage and pipe lines to the Ponto Olivo and Comiso airfields will be constructed as soon as possible.

b. On D plus 4 sufficient materials will arrive to erect 1 - 5000 bbl. tank at or near Gela and to complete the pipe line to Ponte Olivo with the erection of 1 - 1000 bbl. tank at that point to accommodate a shallow draft barge by D plus 8. The pipe line to Comiso will be well under way by D plus 8 and construction of the necessary 3000 feet submarine line will be started on D plus 4.

c. By D plus 12 an additional 5,000 bbl. tank should be ready near the port and an additional 1,000 bbl. tank at Ponte Olivo and 2 - 1,000 bbl. tanks erected at that airport, the pipe line should be completed to Comiso. This will provide approximately 14,000 bbl. storage for V-100 gasoline.

d. It is anticipated that by D plus 20 additional storage of 20,000 bbl. will be completed for V-80 gasoline.

e. For this construction the 2602nd Engineer Pipe Line Company will be available on D plus 4.

f. The following is the schedule for tanker arrival at Gela. It is based on the availability of 2 - 6000 bbl. barges, 1 - 750 ton tanker, 1 - 1000 ton tanker and 4 - 3000 ton tankers.

Size of vessel	Cargo	Arrival Date	Destination Hour
6000 bbl.	V-100	D plus 8	0001
6000 bbl.	V-100	D plus 10	1800
750 T.	V-100	D plus 12	1800
1000 T.	V-100	14	1200
3000 T.	(V-80 - 18,000 bbl. (V-100 - 9,000 bbl.	16	0001
750 T	V-80	18	0001
1000 T	V-80	19	0001
3000 T	V-80	20	0001
750 T.	V-100	D plus 21	1200
3000 T	V-80	23	0600
1000 T	V-100	24	1800
3000 T	V-80	26	0001
750 T	V-100	28	0001
3000 T	V-80	29	0001
1000 T.	V-100	31	0001
3000 T	V-80	32	1200
750 T	V-100	35	0600
3000 T	V-80	36	0001
1000 T	V-100	38	0001

Joss Force special construction.

1. Repair of the Port of Licata.

a. It is doubtful if the use of the Port can be denied to LST by enemy demolitions. Ramps can be constructed from the existing quay or the pontoon causeways used to the port shore area.

b. The quay should be repaired as soon as possible including the roads and railroad within the port area and leading from the port.

c. Materials for this repair work including lumber, track and turnouts will be made available at an early date. For temporary repair local materials should suffice.

2. As soon as captured to repair landing strip at airfield in the vicinity of Licata.

Kool Force special construction.

1. There is a possibility that the Kool Force will be responsible for initial reconstruction of the port of Porto Empedocle.

2. LSTs with causeways will be able to utilize this port until temporary repairs can be made so that existing quays can be used by coasters. Roads and railroad repair within the port area and leading from the port should be commenced as soon as possible.

3. Materials and supplies for this work will be made available at an early date but local materials must be relied on for temporary repair.

Later Construction prior to the fall of Malicious.

1. Communications.

a. No extensive road construction is anticipated. Work will be limited to maintenance and sufficient local materials should be available to meet most of the demands with a small amount of binder required to be brought in.

b. Standard guage railways will be repaired as soon as possible, but demolished bridges must be passed by earth embankments and improvised trestles in the early phases. Railway water facilities must be restored.

2. Utilities.

a. Utilities will be repaired only insofar as is necessary for essential military needs and maintaining sanitation.

b. Water for military purposes will be supplied by the early development of local sources.

c. Electricity will be furnished by unit equipment.

3. Shelter.

a. Depots. Wood frame, tarpaulin covered warehouses will be provided only for supplies that would be damaged by exposure. It is estimated that 20 - 20' X 100' structures will suffice.

b. Lumber will be provided for flooring hospital tents only. Existing facilities will be used insofar as is possible.

c. No troop housing will be provided except by use of local facilities with a minimum of reconditioning. Latrines, kitchens and bath facilities only will be constructed when the situation becomes stabilized enough to permit.

d. Initially, there is no contemplated construction other than previously outlined. For bakeries and laundries mobile equipment should be used. All existing structures will be utilized to the fullest extent.

Initial Construction after the fall of Malicious.

Upon capitulation of the island the first phase of reconstruction includes hasty and temporary repairs to port installations, roads and railways, water supplies, sewers and utilities. This will be carried out in accordance with our original plan drawn up when we were the Western Task Force assigned the mission of capturing the west end of Horrified, modified as required by the existing situation. Materials and supplies for the execution of the original plan have been requisitioned.

Second phase construction.

This will include the following in the priority shown:

1. Highways including bridges.
2. Hospitals.
3. Depots, troop shelter and service installations.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

Repair and maintenance of main roads on Horrified as lines of communication for military needs only is contemplated. No construction of new roads is planned. Construction of hospitals includes flooring and screening of ward hospital tents and the use of existing buildings where available with a minimum of revision. Covered depots will be standard 20' x 100' warehouses and will be limited to those required for perishable supplies. Requirements for troop shelter are based on providing screened kitchens, bath houses and latrines and a minimum of headquarters buildings. Such service installations as require to be housed will be constructed but only after maximum use of existing structures has been made.

Supplies have been requisitioned for the following projects to provide equipment and material thru D plus 120. Supplies for projects beyond D plus 120 will be requisitioned about D plus 15 or D plus 30.

Highways
Bridges
Hospitals
Housing and service installations
Sanitation including pest control
Water Supply
Fire fighting
Utilities
Demolition
Camouflage
Equipment
Rigging

LABOR

1. All civilian labor will be hired and paid by the using Arm or Service.

2. Labor will be hired by direct negotiation and not through any labor agency, labor organization or labor service.

3. Contracting for construction, etc., will be accomplished in the usual manner, provided, such contracting is not in violation of par. 2 above and it has been determined that the Enemy State is not a party to the contract, either directly or indirectly.

4. Prevailing wage rates will be paid but in no case will the maximum rates of pay, as published in the price list, be exceeded without prior approval of the Fiscal Officer, Force 343.

5. Revised and detailed pay rates schedules will be issued at the earliest practicable date.

6. Pay periods will not be longer than on a calendar week basis, Sunday through Saturday, except to provide for emergency conditions.

7. Payrolls will be paid by Class B Agent Officers.

PROCUREMENT OF REAL ESTATE

"Real Estate" includes lands, buildings and all forms of immovable property.

"Enemy State Property" includes all property owned, controlled or administered by any State at war with the United States, and also property of companies, institutions or bodies in which any such State has any substantial interest or over which it exercises substantial control."

The following provisions will govern the acquisition of all real estate on Horrified by units of Task Force 343.

1. How procured. - D plus 5 to D plus 30

a. By immediate occupancy, in the event of urgent necessity, leaving question of rent to be determined by G-4, Task Force 343.

b. By informal written agreement between the Unit Purchasing and Contracting Officer and the owner when ownership has been definitely established. This informal written agreement will follow the form outlined in Section III, Par. 5b, AR 30-1415 and will be prepared in triplicate, one copy being furnished the owner of the property, one copy retained by the disbursing officer paying the account and one copy forwarded the Engineer, Task Force 343.

After D plus 30

c. By procurement through the Engineer, Task Force 343, utilizing the requisition form for convenience. Requisitions should show specific requirements, location (where necessary, including map reference), and details of improvements or modifications, if any, to adapt the property to the purpose for which required. The Engineer, Task Force 343, should be consulted if extensive alterations involving the expenditures of large amounts of critical materials be required. Compensation to be determined by G-4, Task Force 343.

2. Purpose. - Since all initial accommodations for troops will be tented, buildings will not be requisitioned for billeting troops.

Buildings will be acquired for storage of supplies liable to deteriorate by exposure to the elements.

3. Conditions. - All rentals or acquisitions of real property are subject to the following conditions: (FM 27-10)

a. No property of the Enemy State will be purchased or paid for.

b. Where the ownership of the property is unknown, or doubt exists as to whether it is public or private, it shall be treated as public property until ownership is definitely settled.

c. Property of municipalities and of institutions dedicated to religion, charity and education, the arts and science, even when Enemy State property, shall be treated as private property (FM-27-10).

REPORT REQUIRED. A report, designed to protect the United States Government from any unjust claims arising from the occupancy of all real estate, grounds as well as buildings, will be required on all property occupied. This will include all the following information.

REAL ESTATE ACQUISITIONED

_____ (Date)

Date occupied: _____. Occupied by: _____
Description, location and area of premises: _____
_____
Purpose for which used: _____
_____
How acquired: _____
Name and address of owner: _____
_____
Monthly rental: _____. Has lease been executed? _____
Is Copy attached? _____
Condition upon occupancy: _____
_____
_____
Improvements required: _____
_____
Improvements completed: _____
_____
Cost of improvements, if accomplished by U.S. _____
Condition upon vacancy: _____
_____
_____

Reports will be as complete as possible and will be submitted to immediate headquarters where they will be consolidated and forwarded through channels to reach this headquarters as soon as possible after the occupancy of the real estate.

After D plus 30, this headquarters will be notified, in advance, of the date any property is to be vacated.

FUNDS. Funds will be made available to each sub-task force engineer. The amounts and the fiscal procedure will be the subject of a separate memorandum.

SUPPLY PLAN

D to D plus 8

Class II: BGT sets plus selected items including a tactical stockpile.

Class IV: Selected items for specific projects.

After D plus 8

Class II: Normal supply in 21-day increments every 15 days until 4-day reserve is established.

Class IV: Sixty-day supply in even increments in consters from North Africa in anticipated order of requirements which may be varied for special items on demand and by convoy from the United States. Additional sixty-day supply to arrive in two equal increments D plus 90 and D plus 105 by convoy from the United States.

Initially, sub-task force commanders are responsible for their own supply. When supply activities are taken over by the Commanding General, Force 343, the Commander, 1st Engineer Special Brigade will be responsible for the execution of all supply plans within the theatre of operations.

V.

Water to be provided on the basis of one gallon per man per day. Sufficient supply on this basis for five days operation to be brought in five gallon cans or by the Navy in bulk.

Sources of water are available to sub-task forces as follows:

Force	5 Gal. Cans	Bulk-LSTs	Local (g.p.d.)
Cent	7,400	30,000 (3)	497,000 Vittovia aqueduct 1,000,000 Springs-S Croce Camervina
Dime	13,000	50,000 (5)	*367,000 - Gela aqueduct 252,000 - Gela river wells
Joss	17,500	90,000 (9)	150,000 Licata aqueduct Salso River
Kool	7,500	30,000 (3)	----------

* A spring of 79 gpm has been reported at Berdia but not confirmed.

A limited number of 2,000 gal. distillation units are also available.

Five gallon cans to the above total have been ordered to the ports of embarkation where they will be filled by the S.O.S. base section.

The decision as to how many 5 gallon cans will be taken and whether any distillation units will be included rests with each sub-task force commander.

Organic engineers will perform their normal functions including the necessary development of water sources.

The 401st Engineer Water Supply Bn. will develop water supplies in the rear areas, including decontamination of sources and boring wells. It will furnish water in 750-gallon tankers to division and corps water points and to beach groups as required.

If later operations entail the movement of two forces in opposite directions, it is planned to attach one lettered company to each and to leave the balance of the battalion to supply service troops in the rear area.

The 402nd Engineer Water Supply Bn. will be on call in North Africa to supplement the work of the 401st if the demands become too great.

ENGINEER INTELLIGENCE

The procedure for providing the artillery with engineer map information and for producing up to date collated maps will be as follows:

Prior to D day.

a. Personnel - A team will be set up in the vicinity of La Marsa Airport. It will consist of:

1. G-2 photo interpreters.
2. One Artillery counterbattery officer.
3. One Engineer officer with the photomapping platoon of the 66th Engr. Co. Top.

b. Mission - This team will have the primary mission of furnishing the Artillery counterbattery officer with the map coordinates in terms of the British Grid, of targets selected and located by him with the aid of the photo interpreters on the photos. It will have the secondary mission of keeping up to date a collated trace so that collated maps may be printed on short notice.

c. Photo Procedure - G-2 will be responsible for obtaining photos. Initially, at least two sets of photos will be prepared, one set to be used by the interpreters and one set by the Engineers in order to speed up the process of restitution. After these

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

photos have been furnished the priority of printing and delivery of additional copies by G-2 will be as follows:

1. 1 set G-2 Division requesting the sortie
2. 1 set G-2 Corps concerned
3. 1 set G-2 Army
4. Additional selected prints as desired by the original requesting agency.
5. All other requests.

One set of photos will immediately be given to G-2 interpreters who will interpret, plot and annotate them. They will then be given to the counterbattery officer who will select the targets he desires. The photos will then be given to the engineers who will give the counterbattery officer the coordinates of the target. These coordinates will be obtained by restituting from the map as described in FM 6-40, and it is understood that with the facilities available they cannot be more accurate than the maps we are using. The counterbattery officer will then handle the data as he sees fit.

The other set of photos will immediately be given to the engineers who will plot the photo on the map and immediately select and restitute at least three control points. When the annotated photos arrive the engineers will then plot the target and read the coordinates.

If only one set of photos are received it will go to G-2 interpreters and then the engineers in turn who cannot plot and restitute the control points until they receive the annotated prints. This will of course slow down the procedure.

After the counterbattery information has been given to the Artillery, the engineers will plot all annotated data on a trace of the 1/25,000 map. This will be done daily. Upon call from G-2, the engineer will print editions of collated maps.

II - D to approximately D plus 12

No change except that requests for sorties will be radioed back to La Marsa using available channels. Pilots will be briefed by their own air corps people, but our G-2 will insure the presence of a representative to guard against misunderstanding.

G-2 will also have a man available where the prints are made to determine before they are dry whether they are suitable and whether the sortie will have to be reflown.

No prints or map grid corrections can be furnished units prior to D plus 12.

III - After D plus 12

a. Upon the establishment of a G-2 photo interpretation section in the vicinity of an airfield on Horrified, probably Ponta Olive, the same type of team as described in I above will be set up using the 62nd Engr. Co. Top. in place of the 66th Engr. Co. This company will have leapfrogged and moved to Horrified in the early phases to enable it to begin operations by D plus 12.

b. G-2 will handle the requests for sorties directly with our reconnaissance squadron.

IV - Ground Control

a. On D and D plus 4 the Survey platoons of the 66th and 62nd Engr. Cos. will land on Horrified with the missions of:
   1. Surveying in corps artillery points for Joss and Shark.
   2. Obtaining sufficient supplementary control points to enable a radial line plot to be made to determine map accuracy.

b. This control data will be assembled at the 62nd Engr. Co. which will establish the survey center and make the control point.

The information found in this plot will then be incorporated in the restitution process. At the time that the annotation begins on Horrified the 62nd Engr. Co. will also assume responsibility for preparing collated traces and maps until the 66th Co. can arrive on Horrified, at which time the 66th Co. will serve Joss and Kool and the 62nd Co. Cent and Dime.

MAP PLAN

A. The Engineer Map Plan for Operation Husky provides the following issues for each Sub-Task Force.

1. Initial issues.

a. To the Sub Task Force Engineer for troops covering their area of initial operations, to be delivered in bags destined for the following lower units:

(1) An Infantry Regiment
(2) Division Artillery
(3) All other divisional troops and Divisional Headquarters.
(4) Each Regiment not part of a division.
(5) All other Sub-Task Force Troops.

(Categories 3 and 5 will have to be broken down by Engineers of the Sub-Task Force.)

b. To airborne units coverage of the areas of Joss and Shark.

c. To the 9th Division coverage of the area of immediate operations of Joss and Shark.

d. To Headquarters II Corps and Headquarters I Armored Corps complete coverage.

e. To Artillery Headquarters Force 343 covering extra artillery units and AA MAPOG maps.

f. To the Navy of sheets requested by them.

2. Reserves.

a. Sub Task Force - A limited reserve to be carried by the sub-task force engineer so that he may immediately provide for unforseen contingencies. This consists of complete coverage of Horrified in the following scales and quantities per division:

1/100,000 - - - 100 copies
1/250,000 - - - 200 copies

b. Beach Reserve - A beach reserve carried by the Map Depot Detachment attached to each sub-task force. This consists of:

(1) 20% of the initial issue in 1. a. above.
(2) 200 copies of 1/100,000, 1/50,000 and 1/25,000 sheets covering the area of anticipated subsequent operations of each sub-task force.

3. Stocks.

a. Coverage of the balance of the island in all scales to be stocked half in the main depot on the island and half in North Africa.

B. ISSUE.

1. On D - 14 - The Engineer, Force 343, will deliver initial and reserve issues to the Engineers of the Sub-Task Forces on D minus 14. In the event that all maps are not available to 343 in time to allow breakdown and delivery by D minus 14 partial deliveries will have to be made after that date.

A Map Depot Detachment will be attached to each Sub-Task Force on D minus 14. This detachment will consist of:

Dime and Joss - 1 Officer, 4 E.M.
Cent and Kool - 4 E.M.

2. D - 7 to D - Between D minus 7 and D day a map depot will be established at Bizerte to hold reserve stocks and serve reserve troops. Prior to D - 7 the depot will be at Constantine.

3. D day - On D day the map depot detachments will form emergency depots at the beaches on which they land.

4. D plus 4 to D plus 8 - Between D plus 4 and D plus 8 they will consolidate and form two depots in two towns within the beach head. One Depot will serve Cent and Dime, one will serve Joss and Kool. These depots will be reinforced as soon as possible by reserve stock held in Africa and will be moved as the situation indicates.

5. It should be noted that maps will be delivered in rolls of fifty, each roll being coded. It is contemplated to furnish each sub-task force engineer with a code list.

6. Attached are the following tables and indices:

a. Breakdown units and bagmarking

b. Quantities of sheets in unit bags.

c. Assortment of sheets for each distribution with indices.

ANNEX 2 - LANDING SCHEDULE

Incl. #2

Final Pre-D-day Plan For

Debarkation of Engineer Units

Unit	D	D plus 4	D plus 8	Follow Ups
CENT - 45th Div:

ENGR. SECTION SEVENTH ARMY

ANNEX 10

RECOMMENDATIONS – CHANGES IN T/BA

1. Combat Engineer Battalion

TRANSPORTATION

Motorcycles – 3 additional – The number of motorcycles now issued (and it is understood the new T.E.s cut them out altogether) are not sufficient. During the Sicilian Campaign, those we had were invaluable due to the inadequacy of our radio communications and to the continual sabotage of our telephone lines. They are also necessary for the prompt dissemination of information such as captured documents, particularly minefield layouts and photo-interpretation reports that are valueless unless placed in the hands of combat troops immediately. The additional motorcycles are required for battalion headquarters to insure communication with the lettered companies as well as with higher headquarters when radio and telephone service are not available and to provide the necessary convoy control on the march.

1/4-ton Trucks – 2 additional – Prompt and continuous reconnaissance is vital, and adequate control of convoys to insure proper discipline is essential. The present allowance of light vehicles is not sufficient to enable the companies to properly perform these important missions. Also, the 3/4-ton C & R is often too unwieldly for both purposes, especially over difficult terrain and narrow roads.

Two additional 1/4-ton trucks are necessary for headquarters company as follows:

a. One for the combined S-2 and S-3 Sections of the battalion headquarters for their reconnaissance work. At present transportation permits sending only two reconnaissance parties from the battalion at the same time. This is not enough.

b. One for the battalion executive officer who is charged with the control of the battalion convoy when it is on the march and now has no transportation.

3/4-ton W.C. – Nine additional – Each company requires four vehicles of this size. In combat there were continuous demands for small mine detector parties to operate on missions distant from the company. At present, no adequate transportation exists, and the use of a dump truck as a substitute eliminates the dump truck from construction projects and compels the mine detector party to use a vehicle which frequently is not sufficiently mobile over difficult terrain. The fourth vehicle is necessary for supply and motor maintenance.

HEAVY EQUIPMENT

Angledozer, D-7 – One D-7 Angledozer with 20-ton trailer and prime mover must be authorized per battalion. The R-4 Angledozer proved too light in Morocco, Tunisia and Sicily for much of the work. Throughout all of these campaigns, it has been necessary to supplement the bulldozing equipment of the combat battalions with the heavier D-7s in order to accomplish the mission.

1 Shop Truck, General Purpose – Present day operations place a tremendous premium on availability of heavy engineer equipment, especially in the forward areas. To repair this equipment quickly when necessary, and to maintain it properly, the general purpose shop truck is necessary. It is believed that this item of equipment was inadvertently omitted when T/E 5-16 was published.

COMMUNICATIONS

Radios – The problem of proper communications within the combat battalion has been complicated by the speed with which modern operations move and the resultant wide separation of units. Constant communication must be insured between division headquarters and the battalion and between battalion headquarters and the companies.

The following is considered the proper allowance of radio equipment:

SCR 193 or 506 – 5 additional – These sets are necessary in place of the one 284 now authorized, two for battalion headquarters and one for each lettered company. SCR 506 would be more satisfactory because of preset requency channels.

SCR 511 – 2 additional – Eleven of these walky-talky sets are necessary, two for battalion headquarters and three for each line company to insure communications by the battalion with its reconnaissance parties and proper control by the companies over their platoons.

Note – SCR 593 – The twnty-seven of these now authorized are sufficient.

GENERAL EQUIPMENT

Mine Detectors – The present T/BA of mine detectors is entirely inadequate. Mine detectors should be issued on the basis of twelve per lettered company and six per H & S company. The extensive use of mine warfare by the Germans has placed a great premium on this item of equipment. Its use may be limited in future operations if the Germans develop the use of the wooden and plastic non-metallic mines we encountered. However, adequate provision must be made for this item of equipment for use against metallic mines of which there must be a large supply. The present detectors should be improved by waterproofing the coils, strengthening the fragile parts and providing a more shock-absorbing case.

Compasses – 12 additional – Four compasses of an improved type are necessary per lettered company. The laying of minefields and the accurate and prompt report of enemy fields requires a compass better than the present lensatic compass. A compass such as the British Mark III should be issued in addition to the lensatic compasses now authorized.

Shower Units (32 head) – One unit would be desirable per battalion. Units have been improved in this force using distillation units for heating purposes. This proved to be of great value in providing divisions with bathing facilities during periods when they were out of the line.

Binoculars – 10 additional – 10 are necessary in place of the present 6 per headquarters company, and 6 per lettered company in place of the present 4. The requirement for binoculars has been increased because of their need for aircraft identification.

2. Armored Engineer Combat Battalion

TRANSPORTATION

1/4-ton Trucks – 3 additional – The total number of 1/4-ton trucks should be increased by three, and the type of trucks should be changed. At present, forty-six Amphibian trucks and eleven plain trucks are authorized. The amphibian trucks should be reduced to four and placed in headquarters company, and the plain trucks should be increased to fifty-six on the basis of eleven in headquarters company, ten in each lettered company, four in the bridge company and one for the medical detachment.

M-3 Half Track – Some of the half tracks, in the company maintenance section, should be changed to 2½-ton trucks with winch. The total number of half-tracks is now forty-six. Seven of these should be replaced with 2½-ton trucks with winch.

Ambulances – 2 additional – The two M-3 half tracks of the medical detachment should be changed to ambulances to provide a total of three.

Communications

SCR 510 Sets – All SCR 510 sets should be replaced with SCR 528 sets, to be issued on the basis of five per lettered company, two in the bridge company, and six in the headquarters company.

HEAVY EQUIPMENT

D-7 Angledozers – Each battalion should be equipped with one D-7 Angledozer with 20-ton trailer and prime mover. The same remarks as under the combat battalion apply.

Cranes,-truck mounted – 1 additional – The present 8-ton 4 x 4 crane authorized for the bridge company is too light and should be replaced by 8-ton 6 x 6 truck-mounted cranes, and an additional crane authorized.

GENERAL EQUIPMENT

Mine detectors: The same remarks as for Combat Battalion apply. The basis of issue should be 12 per lettered company and six in headquarters company.

Shower Unit: (Same as for Combat Battalion.)

Compasses: (Same as for Combat Battalion.)

Binoculars: These should be increased on the same basis for the Combat Battalion.

3. Combat Engineer Regiments

TRANSPORTATION

Motorcycles – 13 additional – As in the combat battalion, there is a definite need for more motorcycles for messenger work and convoy control. It is recommended that these be available on the following basis: Two per lettered company, two per battalion headquarters, and three for H & S company.

1/4-ton Trucks – 2 additional – The same remarks as for the combat battalion applies for the combat regiments. The new T/Es correct the present deficiencies, for the lettered company but two additional trucks should be allotted to the H & S company.

3/4-ton W.C. – As for the combat battalion, the present allotment is not sufficient, but the deficiency is corrected by the new T/Es.

Ambulances – 1 additional – One is not sufficient. The allowance should be increased to two.

Heavy Equipment – D-7 Angledozers – 3 additional – Heavier angledozers are as essential for the combat regiment as for the combat battalion. In addition to the present R-4s, three D-7 angledozers with 20-ton trailers and prime movers should be allotted to each combat regiment.

Motor Patrols – 1 additional grader – The allowance of motor patrols should be increased. Work is often assigned on a battalion basis and an additional road grader would have been of tremendous value. It is recommended that the allotment be increased to two per regiment.

COMMUNICATIONS

Radios – The present authorization of radios is not adequate. There is no radio provided for the company headquarters nor for the platoons of H & S company. It is recommended that radios be issued in the following basis:

SCR 193, or 506 – 2 per regimental headquarters, 1 per battalion and 1 for each lettered company headquarters; the SCR 506 would be more satisfactory because of preset frequency channels.

SCR 511, one per platoon – – – –	20
SCR 593, one per squad of lettered company –	54

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

Field Telephones - It is recommended that fifteen field telephones, together with four-five cord switch boards, be issued per regiment, so that adequate telephone communication in companies, battalions and staff sections will be possible.

General Equipment

Mine Detectors - It is recommended that mine detectors be issued on the basis of twelve per lettered company and a reserve of twlve in H & S company, or a total of 84 mine detectors per combat regiment.

Compasses - The same remarks regarding compasses as made for the combat battalion applies to the regiment, and it is recommended that the improved compass be issued on the basis of four per lettered company.

Binoculars - It is recommended that they be issued on the basis of six per lettered company; two per battalion headquarters and ten per H & S company.

4. Engineer General Service Regiment

Heavy Equipment - As in the case of the combat units, the bulldozers now supplied the general service regiments are inadequate. It is recommended that each general service regiment be equipped with six D-7 angledozers with 20-ton prime movers in place of the R-4s. This on the basis of one per company.

Permanent or semi-permanent line of communication repair including the construction of bridges is one of the main functions of these units. The following equipment is recommended to permit them to properly accomplish this mission:

2 - concrete mixers
2 - moto cranes
1 - rock crusher with two prime movers
1 - asphalt distributor
1 - road roller

5. Engineer Water Supply Battalion

TRANSPORTATION

2/4-ton C & R - 1 additional - The allotted number of C & Rs should be increased by one. Of the four authorized at present, each company is authorized one and the one in headquarters and service company is on T/O authority for the battalion commander; consequently, there is no light vehicle of this type for H & S company's use.

2/4-ton W.C. - 2 additional - These are necessary for the well drilling section for water reconnaissance work and because this section frequently operates independently. At present no light transportation is authorized.

Trailer, 1/4-ton - 5 additional - There is not sufficient light cargo transportation in the unit at present. It is recommended that five 1/4-ton trailers be allotted on the basis of one per lettered company and two per H & S company. These vehicles are necessary and ideal for water maintenance and reconnaissance work.

EQUIPMENT

Water purification Equipment - 2 additional - Six portable water purification units with hypochlorinators are required, one per lettered company and three in H & S company for issue to companies when required. During the present operation we actually had this equipment.

Canvas Tanks, 3,000-gallon - The present allowance of 3,000-gallon water tanks is wholly inadequate and should be increased to provide a total of 48 for the battalion.

6. Topographic Company

TRANSPORTATION

1/4-ton truck - 2 additional - The number of 1/4-ton trucks has not proved sufficient. The rapidity with which the survey platoons must extend control to support artillery survey necissitates individual transportation for survey parties. It is recommended that two additional 1/4 ton trucks be allotted the company for this purpose.

3/4-ton truck, W.C. - At present the Topographic Co. is allotted two 3/4 ton weapons carriers and two 3/4 ton carry alls. Carryalls proved to be of no value and should be eliminated entirely. The allotment of weapons carriers does not provide sufficient flexability for the survey platoon and it is recommended that the present allotment of weapons carriers and carryalls be changed to five 3/4 ton weapons carriers.

SURVEY EQUIPMENT

It is recommended that the following be added to the survey equipment for the reasons stated:

6 ea Heliotropes for assistance in long distance triangulation.

6 ea SCR #510 two way radios to assist in the rapid coordination of field survey parties and the rapid check and dissemination of data.

6 Signal beacons similar to the British M1 to provide a portable signal which can quickly be erected without the use of local materials.

2 pr. Binoculars M3 (total of 6) to facilitate rapid identification of control stations.

GENERAL EQUIPMENT

One additional 5 KVA generator is needed.

ORDNANCE EQUIPMENT

The present armament (rifles) of the survey platoon is unsatisfactory and cumbersome. It is recommended that pistols be substituted for rifles.

7. Engineer Maintenance Company

EQUIPMENT

Shop, Motorized, General Purpose - Two additional general purpose shops should be provided to give the company a total of four.

Compressors, Air (2.7 Cfm) - Two additional air compressors should be provided.

8. Engineer Depot Company

EQUIPMENT

Crane, mobile - 3 additional - The present TBA authorizes only one mobile crane, which is wholly inadequate. An engineer depot or dump cannot operate without a crane. In the campaign just closed, our depot company operated four depots and dumps and for this purpose we were able to obtain eight cranes. It is recommended that this company be equipped with four Moto Cranes.

9. Engineer Utilities Company

TRANSPORTATION

2/4-ton Trucks, WC - 2 additional - As in the case of other units, the light transportation of this organization is inadequate and the allotment of 3/4-ton trucks, WC, should be increased by two to provide a total of six.

1/4-ton Truck - 2 additional - The same applies to the 1/4-ton, which should be increased by two to provide a total of four.

EQUIPMENT

This company should be furnished the following additional equipment:

Two additional pipe-fitting sets and two carpenter sets.

Other Units

The following additional types of engineer units have been under the control of Engineer Section, Seventh Army, for varying periods during the Sicilian campaign. Their operations thus far have not revealed the necessity for any major changes in T/BA, and thus no recommendations for changes are made at this time.

Port Construction and Repair Group
Company of Camouflage Bn.
Petroleum Distribution Co.
Dump Truck Co.
Map Depot Det.
Firefighting Platoon

General Recommendations

a. Each unit operating a kitchen should be provided with one 250 gallon water trailer.

b. Brushes in all sign painting sets should be increased 100%.

c. Mine detectors should be packed in water and shock proof containers.

d. Air compressors should have capacity of 150 cu. ft. per minute.

e. Spare parts for heavy equipment should be provided in larger quantities.

f. Fifty percent of the D-handled shovels in squad and platoon sets should be eliminated and long handled shovels substituted.

g. 150 ft./minute rock drils with the air compressor should be substituted for the lighter drills.

h. It would be highly desirable to replace the 4-ton prime mover and the 8-ton trailer for the R-4 Angledozer with a low bed 6-ton truck. The present prime mover and trailer proved unwieldly on the narrow winding Sicilian roads. The additional 3/4-ton trucks will make up for cargo carrying capacity eliminated.

Note - Recommendations on the Shore Regiments are not included in this report since they are covered in the report of the 1st Engineer Special Brigade.

ANNEX II

RECOMMENDED BASIS ISSUE

MINE DETECTORS

This and the following pages indicate the basis used for the issue of mine detectors to units of the Seventh Army. This issue proved adequate and is recommended.

ANNEX 12

FIRST ENGINEER SPECIAL BRIGADE

SHORE ENGINEERS IN SICILY
(10 July 1943 et sequi)

I—FOREWORD

1. CONTENT AND PURPOSES: This paper is not a treatise on the Shore Engineers but a resume of the conclusions of the responsible Engineer commanders covering only certain points which seem to be of major importance and interest. They are presented in order to afford basis for improvement in organization, technique, and operation with an eye on further employment of the Shore Engineers.

II—HISTORY

2. LANDING: Three Engineer Shore Groups were used in the landing, one with each of three reinforced Infantry Divisions, landing at Licata, Gela, and Scoglitti. A fourth and small group landed with the floating reserve in the vicinity of Gela over already established beaches. The organization of the four groups is shown at Appendix "A".

3. DUAL FUNCTIONS OF THE SHORE ENGINEERS: In this operation the Shore Engineers performed their usual mission of landing troops, equipment, and supplies and establishing beach dumps. In addition they were charged with the execution of all supply plans of the Seventh Army from the time the Army assumed control of the situation ashore. Troops were attached for the latter purpose so that at one time the Shore Engineer Brigade numbered, with attachments, not far from 20,000 officers and men. At first the axis of supply was north and south. Then it was shifted to northwest and southeast. Finally, the other two axes still in operation, an east and west axis was set up with Palermo as a base port. The territory covered in these operations embraced the island of Sicily west of the line Scoglitti—Vittorio—Mineoia—St. Stefano, all inclusive. About D+20 the Army began to relieve the Shore Engineers in the operation of advanced supply points (army dumps) by a re-arrangement of attached troops and the assignment of directing personnel from the Army Headquarters.

4. BEACH MAINTENANCE AND PORTS: Favored by ideal weather except for a few hours now and then, by an almost total lack of enemy interference after D+1, and by the use of the small ports of Licata and Empedocle, little difficulty was experienced in carrying out unloading operations as planned, so far as the factors referred to were involved. With fair weather and no enemy, beach maintenance, except for heavy lifts, could have been continued indefinitely on a scale large enough to insure supply. However, the maximum use of deep water ports at the earliest moment is still the real goal for continued operation. The results of operations to include D+21 appear at Appendix "B".

5. RAILROADS: The railroads were damaged only slightly. The Shore Engineers began to put them back in operation by D+1. They were the decisive factor in the rapid pushing forward of the supply lines because there were simply not half enough supply vehicles to have carried the tonnage which the rapid advance demanded.

III—ORGANIZATION

6. SHORE GROUPS: a. The backbone of Shore Engineer operation was the Shore Group, composed essentially of a shore regiment, a signal company, and ordnance (MM) (Q), a medical battalion, a quartermaster battalion, (DUKW), and a naval beach battalion. This group was augmented for the occasion by small detachments of service personnel such as dump operating details of the various services, railway personnel, gasoline supply troops, and truck companies.

b. One outstanding lesson learned was the vital importance of the permanent establishment of the group in its essential components - "permanent" in the sense of existence so long as amphibian operations are in prospect. Complete and detailed indoctrination and training, discipline, the development of esprit and elan, thorough acquaintanceship, supply and the maintenance of equipment, demand permanence, particularly if more opposition is expected to be encountered in future undertakings. A proposed Beach Group organization is shown at Appendix "C".

7. THE ENGINEER SHORE BRIGADE: The Shore Groups, after the initial stages, passed to the control of the 1st Engineer Special Brigade. The Brigade headquarters is organized on a permanent basis. For this occasion it was reinforced by personnel from a base area group designated to take over eventually the normal supply and administration of the rear area.

8. BRIGADE TROOPS: a. The Brigade Signal Company, the 286th, performed invaluable service. It needs a construction section in order to provide wire communication over extensive areas.

b. Ordnance Small Arms Platoon: Such a platoon is assigned and is necessary.

c. Postal Unit: In view of the number of troops in the Brigade, a postal unit is essential and should be permanently attached or assigned.

d. Finance Detachment: An adequate number of Finance Department personnel is a necessity, both for the payment of troops and the handling of supply, rent, and civilian labor accounts.

e. Medical Service: There is none in Brigade headquarters. There should be.

f. Quartermaster: There should be a Brigade Quartermaster with a Quartermaster Headquarters.

g. Ordnance: There should be a Brigade Ordnance Officer with suitable assistance.

h. Engineer: A Brigade Engineer with suitable assistance is a necessity in connection with port repairs, roads, railroads, water, power, and kindred items.

i. Motor Officer: A Brigade Automotive Officer with technical assistance is a vital need if motor maintenance is ever to be lifted above its present unsatisfactory status.

9. BRIGADE ORGANIZATION IN GENERAL: Except for troops attached for some particular operation, the Brigade should be organized on a "permanent" basis for the reasons already stated in 6 b, above. Based on its normal mission of landing men, equipment, and supplies, the organization shown at Appendix "C" is considered to be necessary. Such an organization can support the landing of three Infantry Divisions with attachments and maintain them, not having too much hard luck, for an indefinite period. If the mission of the Brigade is enlarged, as it has been, to include the operation of supply lines and advanced supply points and rear area installations, necessary attachments, made well in advance, can be provided.

10. ENLARGEMENT OF UNITS: The personnel which has borne the brunt of operations here has been the vehicle personnel. An examination of the motor vehicle operators' situation will reveal that in most cases only one driver per vehicle is provided and in no instances more than a few spares. Success calls for twenty-four hour operation of all vehicles and machinery. There never can be enough vehicles so what there are must be used to the maximum. Considering other necessary duties, there is not enough manpower in the units of the beach groups to provide two shifts of qualified drivers. On many occasions large numbers of vehicles stood idle on account of driver exhaustion. Drivers can hold out for two or three days, at the cost of an increased accident rate, and then they crumple. An additional operator should be authorized for every vehicle and machine in the Engineer Brigade and in addition 20% spares.

11. SHORE VERSUS COMBAT ENGINEERS: a. In this operation the shore engineer troops consisted of one engineer shore regiment (the 531st), two combat engineer regiments of three battalions each (the 36th and 40th), one combat engineer regiment of two battalions (the 540th). Both the 36th and the 540th came to Africa last November as shore regiments and have had extensive shore engineer training throughout their histories. Both performed well. The 40th Engineers was an untried combat regiment with shore training which did not hit its stride until sometime after the landing.

b. This operation demonstrated the fallacy of the idea that shore engineering is a side line which can be picked up by combat (and general service) regiments and then dropped after an operation. In the first place, combat engineers have not the strength, the organization, nor the proper assortment of specialists to do the job most efficiently. In particular, they lack the proper number of officers and the battalion headquarters and service companies which are essential to successful operation. The shore engineers work for the greater part by battalions spaced over a considerable stretch of territory. These battalions must be very largely self-contained and self-sustaining. Combat engineers do not have the facilities to effect a sound and efficient organization of their battalions in this regard. The shore regimental headquarters does not enter the scene ashore until the show is well along but it, too, is essential and cannot be organized out of what is available in the combat regiment.

c. The supply and the preliminary preparation of equipment and material for a shore operation is a long complex, and arduous task only to be undertaken by shore engineers who have the experience, detailed knowledge, and time to attend to it. It is one of the most important parts of successful operation and is not to be lightly undertaken by combat engineers who have to learn as they go through a few weeks of "training". Either they learn too late or never learn at all.

d. The training of shore engineers is a long drawn out process that cannot be handled by lectures and "exercises". Knowledge of ships and craft and work with, aboard, and around them cannot be acquired in a few weeks. It is vital to success that the shore engineers, whose work is in perhaps the hottest spot of all until the enemy is pushed well back and his air power beaten down, think, dream, eat, and live shore engineering. Confidence in their ability as a result of sound and thorough training plus pride in their calling are the elements, the moral factors, that will make the difference between success and failure in a tough operation. Part-time shore engineers are deprived of these most necessary aids (spark plugs) by the very nature of their employment.

e. On the equipment side, the combat engineers are loaded down with much unwanted combat engineer equipment, which either must be lugged along or left behind, for the greater part, with stay back details. The latter weakens them in manpower and makes their equipment non-available if it should be needed. On the other hand, they do not have the heavy equipment needed for shore operations. The shore engineers do have, except in transportation, more and better equipment for combat engineering as it is practiced by the typical combat engineer regiment than do the combat engineers themselves.

f. On the training side, there is nothing that combat engineers know or do that is strange to shore engineers. In this operation, the shore engineers have worked on communications (road, bridges, and railways); removed mines and booby traps; executed various construction projects; and fought as infantry. Companies and battalions of them have worked inshore as far as sixty and seventy miles.

g. The conclusion is this: - in the light of the foregoing, it is far better to organize, equip, and train troops which are to perform shore engineer tasks as shore engineers than to superimpose shore engineer functions on combat engineers as a part-time avocation. Soundly trained shore engineers can operate effectively as combat engineers without change in their thinking, organization, or equipment; combat engineers cannot operate effectively as shore engineers without change so revolutionary as to make them, in effect, shore engineers but even then they are liable to be the victims of undermanned, improvised, ill-adapted organizations; inadequate supply, preparation, and training; divided thinking; and of a burden of unnecessary and unwanted equipment.

IV—NOTES ON OPERATION

12. General: As a whole, doctrine and methods were found to be sound and no basic changes in either seem to be necessary or desirable.

13. Army - Navy Liaison: Better information regarding ship movements and the nature of cargoes, more promptly received, would have been of great assistance. The situation might have been improved had the Brigade had liaison officers aboard the flagship, with ship to shore communications of radio and fast boats, to secure and send in the details of projected ship movements, ship's manifests, and of changes in plan, as they became available.

14. Interferences: a. Better results would have been attained had there been a more wide-spread knowledge of the purpose and functions of shore engineers. In effect they operate a marine terminal. They can carry on with the desirable degree of efficiency only if the beaches are kept clear of people and property; if every effort is made to avoid using their vehicles and equipment outside of the terminal area, and if command channels are followed by troops ashore in seeking equipment, supplies and priorities.

b. Well in advance of future operations it might be found helpful if time could be made available for the study of the capabilities of the shore engineers.

(1) If initially they diverted, in whole or in part, to assist, with men and equipment, in tactical operations.

(2) If they are confined to beach operations.

Such a study would be materially helpful to the engineers and those they support in reaching and understanding of their respective duties and difficulties.

c. Since it would seem that normally it might be expected that more than one tactical unit will use a given beach, the shore engineers should be in support of incoming units and not attached to them. The period of detachment is apt to be a time of delay and confusion that it is well to avoid. If shore groups are to be attached to some landing unit temporarily, care should be taken to leave them in the beach areas so disposed as to be able to take care of units landing later.

15. Unloading Over the Beaches: a. This was the first large scale employment of DUKWS. They proved to be very sturdy vehicles that could go anywhere. When the water and land hauls were short (a mile each, as at Licata) and rough seas did not interfere, their performance was up to advance expectations. Under the conditions stated, they are a reliable and rapid means of getting supplies from ship to dump. The number supplied was about right. However, where the water haul was long it was much more satisfactory and rapid, even at the cost of extra manhandling, to bring cargo in in LCT's. The LCT's with parts of the bulwarks cut away were especially useful as a DUKW could be loaded on either side while unloading was proceeding via the ramp.

b. On the land side, many DUKW hours were lost and some DUKWS ruined for use as boats by excessively long hauls; by accident; by improper employment of cranes and "A" frames; by underinflation of tires; poor driver instruction, control, and direction; and b lack of efficient guides and traffic control, including sign-posting of roads and installations. Many DUKWS were diverted from their primary mission and used as trucks for long distances inland, thus disrupting the unloading plan; frequently clogging important roads with the ungainly bulk of the DUKWS; and getting the DUKWS involved in various types of accidents that probably would not have occurred had the DUKWS been confined to their proper orbit.

c. Some DUKWS were sunk because they were overloaded by personnel aboard ship who persisted in crowding in cargo in spite of warning given by the drivers.

d. The use of beach sleds for carrying shore engineer equipment and supplies met with varying degrees of success. One regiment reported very good results; one regiment had fair results; another regiment wants to burn its sleds. All regimental commanders agree that DUKWS would eliminate the sled problem.

e. In manhandling cargo 8 foot chutes for the DUKWS were very useful. On the LCT's the ordnance type of roller conveyor was most useful in moving freight down the ramps.

f. The small angle-dozer was definitely of little use. The D-7's were exactly what was required but their blades should be trimmed so that they will more readily fit in craft. The small highwheeled prime mover used around airfields would have been very useful.

g. One item sadly lacking was a sufficient supply of tires and tubes for the DUKWS. This was a last minute matter that never got attended to. Brake fluid for DUKWS was another major lack. In this general connection, the equipping of shore troops was very late and never entirely or satisfactorily completed. This delay was seriously felt during the operation. Some equipment was very slow in arriving; some never came at all or was incomplete; some was apparently the cast-off property of other units because it was received in non-operable condition—there was not time to repair it.

h. The Navy pontoon causeways were invaluable but they do need better or heavier anchors to keep them from broaching. More of them would have been useful. On the flat beaches encountered here they were, until the small ports were opened, the only means of unloading vehicles and tanks rapidly and in quantity.

i. Naval Beach Companies: These units did well considering their limited training. They did not confine themselves to the bare outlines of their prescribed duties but lent a hand at whatever had to be done. They would have been much more useful had they had one or two fast boats for communication and traffic control and had they had small temporary salvage parties at work. Such salvage parties, equipped with small gasoline driven pumps, would have been able to re-float numbers of swamped craft almost immediately. They were withdrawn by the Navy without notice to the Brigade, an action which hampered proposed further operations.

16. Operations on Beaches:

a. Defense: Anti-aircraft defenses of the beach should be under one command. This was not always the case. The 37 mm anti-tank gun currently issued the shore engineers is felt to be inadequate. Six larger caliber guns per battalion, which need not be equipped with prime movers since equipment is available to move them the few necessary hundred yards, would be an improvement. Barrage balloons on beaches will break up strafing.

b. Water: A reserve of water at the rate of one gallon per man, brought in cans, is considered to be sufficient. The water purification units furnished the shore regiments should be divided among the shore battalions and waterpoints opened at the earliest moment. It was found practicable to pump water from LST's into canvas tanks ashore.

c. Mines: More casualties were caused by mines then were necessary. Men and vehicles would have been saved had there been better discipline; and had there been better control and direction. Traffic must be confined to cleared areas. Mine detectors must be divided among the craft and not collected in one boat and sunk all together as happened in one instance.

d. Kitchens: The shore engineers should set up their kitchens promptly and serve simple hot food and drink to all comers, particularly walking wounded and other casuals, either coming or going, who frequently arrived exhausted. A hot drink put many back on their feet.

e. Staging: Shore engineers must promptly select staging areas and organize them for incoming troops, providing the necessary guides, signs, and facilities to settle the troops quickly and reporting their arrival to higher headquarters at once so that they may be moved on without delay.

f. Dumps and Transportation: Shore engineers must plan and study in advance the details of dump operation and must be prepared to set up a centralized transportation service, under rigid control, for the movement of supplies from beach to dump. In this connection, it is imperative that cargo vehicles be landed on a very high priority in order to provide means for getting supplies off the beach. Beaches must be kept clear.

g. Local Purchase and Hire: Before embarking all the details in connection with these items must be settled and the necessary forms and funds placed in the hands of purchasing and contracting officers in each battalion and higher unit. These officers will need clerical assistance instructed ahead of time.

h. Camouflage: Efforts to camouflage installations and bivouacs must be pushed. The beach itself cannot be hidden. Dummy boats would only confuse our own situation on beaches which are always overcrowded. Personnel and equipment cannot be spared for dummy beaches.

i. Fire Protection: If space permits, fire fighting equipment on the beach and in the dumps would be a great assistance.

j. Lights: A great hardship in night unloading is the absence of lights in ship's holds. As soon as the situation admits, some light ought to be provided. This might be fairly early in the operation and is worth considerable trouble to arrange.

k. Beach Road Material: The light reinforced netting, burlap backed, with wicket-shaped hold downs was found entirely satisfactory except on grades. On grades of over 5% pierced steel plank was the only good answer. The cloverleaf bar from artillery ammunition crates was useful as a hold down.

l. Treadway Bridge: No use was made of this equipment and no use of it in landing operations where it encounters wave action is considered practicable.

m. Air Corps Dumps: The Air Corps has so much specialized equipment that a detail of AIF Corps personnel to assist in the dumps would be a decided advantage.

n. Water Proofed Vehicles: The current method of water-proofing vehicles proved satisfactory except that in the case of 1/4 ton trucks the vehicles almost invariably "drowned out". This may have been due to excessive operation after water-proofing and before embarking. Drivers of all water-proofed vehicles must be taught how to slip into the water and avoid setting up bow waves.

o. Trailers: These were a prolific source of trouble and should not be landed until they can be brought in the dry. Essential equipment, such as signal apparatus, is better handled in DUKWS.

p. Naval Command: Due to unfamiliarity with naval organizations and methods, considerable confusion arose in attempts to find out what part of the Navy was responsible for a given activity or undertaking, what Naval Officer was in charge, and where he was and could be reached. The establishment of a consolidated naval headquarters ashore in each division area (or at least a liaison post) would be of great assistance. Such headquarters would be in charge of all naval shore activities except the beach companies.

q. Freight Lightering: The most useful freight lighter was the LCT. With rough water or ships anchored out more than a mile it was found better practice to unload into LCT's and transfer the freight at the beach than to use DUKWS for the entire haul. However, LCT's were frequently shifted between ports or taken away entirely, without notice, and this caused delay and confusion. In the future, considerable prior thought to provision of LCT's for each unloading point will be profitable.

r. Slings and Nets: Slings and nets should have been used to a greater extent in loading and unloading vehicles. Breaking of packages is lessened and the transfer process speeded up. Nets should be spread in vehicles if they are hand loaded and the vehicles unloaded by crane of "A" frame derrick.

17. Vehicle Maintenance: Vehicle maintenance must be systematic, continuous, and thorough. If Army Regulations and other orders are followed to the letter, as they can be even in times of pressure, the problem is solved. There was a general non-compliance which proved costly. Officers who do not take care of their vehicles, no matter who they are, should be summarily relieved and drastically dealt with. The invariable excuse was that everyone was "so busy".

V— TRAINING

18. Basic Soldiering: The operation showed the need for more and better instruction of the individual officer and soldier. They need detailed instruction in clean and orderly living in the field; how to get along with little and make that little do; how to take care of arms, equipment, and clothing and the necessity for doing so; their personal responsibility for government property of all sorts. They must be taught and required to perform their individual duties. They need the alertness that comes from physical fitness, and insistence on military courtesy and the smart performance of all duties. They need commanders of all grades who know what to do, how to teach others, and who are possessed of the physical strength to work all day and all night and the determination and the moral courage to exact from the subordinates a full performance of all their duties under all circumstances.

19. Discipline: a. Instant and instinctive obedience has got to be taught all ranks. Too much time is wasted in argument, discussion, and coaxing. It was found that commanders of all grades in the Brigade were reluctant, for one reason or another to take summary and certain action against the recalcitrant, the laggard, and the neglectful and shiftless. Either they were lazy, ignorant, or lacking in the necessary force of character or, based on past experience, they felt that they would not be supported or would be adversely criticized. The greatest need shown in this operation was the need of discipline on the part of individuals and control on the part of commanders.

b. Work Aboard Ship: All shore engineer companies should receive practical training in working cargo on ships with particular attention to the training of winch drivers. A great shortage of hatch crews and winchmen became felt very early. With proper training beforehand, ships can have hatch crews from the shore engineers in the absence of the expected arrival of other troops who are to furnish them.

20. Combined Training: a. Before coming on this operation, much time was spent on combined training. The units of the Brigade were attached to sub-task forces and passed from control of the Brigade Commander for some two months. The result was that the shore engineer units, in some instances, were left too much to their own devices in matters of discipline, administration, internal economy, supply, and their own training. It is believed that shore group troops should remain under Brigade control throughout and that combined training involving the shore engineers should be arranged between the Brigade and other commanders concerned.

b. The combined training was quite unsatisfactory from the standpoint of the shore engineers because it was not carried through completely so far as involved them. Landings were conducted with reduced personnel and reduced equipment and were generally brought to a halt long before more than a token quantity of shore engineers equipment and of other stores and vehicles had been landed. There is some profit but not much in landing a few shore engineers and a little equipment and then returning to bivouac. The responsible commanders should make earnest effort to enlarge and lengthen the exercises so as to give the shore engineers a realistic workout. This would include landing considerable numbers of vehicles and considerable quantities of supplies and their dispersal in dumps.

VI— SUPPLY

21. ORGANIZATIONAL EQUIPMENT: This was generally satisfactory but not all of it arrived. Additional equipment needed is one more crane per engineer shore company and speedboats at the rate of two per battalion, regimental, and Brigade headquarters of the shore engineers. A flight of three Cub airplanes for Brigade headquarters is desirable in any operation as widespread as this.

22. INDIVIDUAL EQUIPMENT: a. The bag, field, and the accompanying suspenders should be replaced, in active operations, by the infantry pack for all individuals of the Brigade. Walking is very much in order. There is no known method by which a soldier can carry his equipment in a pack around a musette bag except at the cost of suffering and untimely fatigue.

b. For campaign, men should be stripped down to what they can reasonably carry on their backs on a long march. Worn articles should be replaced out of small reserve stocks in Army supply points. Barracks bags should be left in garrison. The manpower consumed in this operation, along with the consumption of gasoline and wear and tear on vehicles, carting around barracks bags and other unnecessary baggage would add up to a staggering total.

VII—GENERAL REMARKS

23. FUTURE OPERATIONS: So far as involved this Brigade, it is considered essential that it be read into the situation very early in the day in order to make its experience available to the planning heads and to those with whom it will work; to discover and work out the problems peculiar to the expedition which affect the operations of shore engineers; and to spread proved shore engineer doctrine among all concerned.

24. THE BRIGADE SITUATION: Before this Brigade undertakes another large-scale operation it needs these things:

a. A sound and permanent organization with the essential Brigade and beach group troops permanently assigned.

b. Time for refit and overhaul, estimated at six weeks from arrival in a training area.

c. Time for perfecting its training in basic soldiering and raising of standards, estimated at two months, including the six weeks required under b., just above.

REPORT OF THE HEADQUARTERS COMMANDANT

The following is a report of the role played by the Office of the Headquarters Commandant in the recent invasion of Sicily and the campaign following that invasion. Viewing the invasion as a single phase, and in order to facilitate analysis and discussion, the report is divided, roughly, into three stages or periods, viz., Preliminary Stage - Secondary Stage - (Covering the period on board ship) - and Final Stage. However, since these periods or stages tend to merge and overlap, in the nature of things this pattern cannot be strictly followed at all times. The narrative portion of this report is followed by a summary of conclusions drawn and recommendations made, with an eye to eliminating, in future campaigns, those factors which more or less tended to retard operations.

PRELIMINARY STAGE

Working in conjunction with officers from G-1 and G-4, this section left Mostaganem for Bizerte, June 1, with a convoy, for the purpose of establishing a Headquarters and setting up billets and bivouac areas. (Apparently original plans were later revised, and the location employed as our Rear Echelon). This advance group consisted primarily of enlisted personnel of the Headquarters Company and skilled civilian employees, the latter carried along to help put buildings in a habitable condition. This was necessitated by the condition of the new location, where, literally, not a single building was fit for occupancy without a good deal of labor.

Meanwhile, back at Mostaganem, an officer from the Headquarters Company had been designated as TQM of the Headquarters Command Ship and Headquarters Company representative. Another Headquarters Company officer, acting in the capacity of Headquarters Commandant took charge of that section of the Headquarters Company, personnel and supply, scheduled to travel on the LST. Their duties and activities are discussed below.

Thus, it may be seen, functions normally allocated to the Office of the Headquarters Commandant, were being actively carried out in three separate areas.

At Bizerte, a French Caserne was chosen as Headquarters, bivouac areas were spotted, billets found. As noted above, the city was a shambles with consequent damage to public utilities - water and electricity. Because of the magnitude of the task, it was found necessary to engage the services of many additional civilians as plumbers, painters, plasterers, etc. The aid of Army Engineer and QM units was enlisted to clear away the debris. It was found necessary to scout the surrounding communities for essential building materials whose need could not be anticipated. During the month of June and early July, small and large detachments of Headquarters Personnel arrived, from time to time, and were assigned space and quarters. Vehicles of the *** QM Company were used for transportation and these shuttled back and forth between Mostaganem and Bizerte.

Toward the middle of June, the officer designated as TQM assumed his duties. In a conference with G-3, the situation was outlined and a visit to the ship resulted in full knowledge of the manifold duties. These included the establishment of liaison between ourselves and the Navy; the loading of freight, vehicles, and personnel; assignment of billets, rearrangement of facilities, and messing assignments; the selection and transporting of a ship's platoon to the boat and acquainting them with their duties; and, the reception of road convoys and loading of the personnel aboard.

Due to repair and modifications aboard the MONROVIA, the loading time in Oran was sharply limited. The ship's platoon had arrived several days prior to loading and were familiarized with the loading technique. The Headquarters Command Ship sailed for Algiers with the Assistant TQM and ship's platoon aboard.

Arrangements were made in Oran, for the majority of initial and reserve supplies for the landing phase. Headquarters Ships had not been included in the supply plan the intention being to outfit them from the surplus included in the reserves of each Task Force.

At Algiers, loading of cargo was completed satisfactorily, including extra tonnage.

A third officer from the Headquarters Company continued as Headquarters Commandant at Mostaganem. He carried out the usual functions of the office, and facilitated the despatch of further convoys to Bizerte, i.e., personnel, equipment, and supplies. Later, he supervised loading of the LST which sailed for Tunis.

SECONDARY STAGE

The section of the Headquarters Commandant at Bizerte took no part in initial landing operations. Alerted on D-1, vehicles proceeded to the loading docks prepared to load at a moment's notice. The LSTs did not return until D+3, however, at which time loading took place. The trip to Licata proved uneventful, unloading was rapid and without incident. The group bivouaced approximately one mile inland, for the night, and proceeded by highway to Gela the following morning.

Billeting facilities aboard the MONROVIA were found to be wholly inadequate. With three messes operating, no difficulty was encountered. Three sittings were required for the Officers' Mess, both Army and Navy. When the Troop Commander came aboard, the ship's platoon passed under his jurisdiction, and remained on troop detail until the start of unloading.

FINAL STAGE

Prior to unloading of personnel, the TQM, announced priorities, compiled personnel lists of the boat teams and executed unloading operations.

Vehicles and bulk cargo were unloaded with despatch.

Off-shore at Gela, contact between the LST and Headquarters Command ship was established. The LST was unloaded with little incident. The first LCT landed at 0400, D plus 2. The last landed about 1030.

Bivouac areas were selected and work commenced on a building in town which had been selected as Main Headquarters by an advance party from G-1.

CAMPAIGN

After about ten days, Headquarters moved on to Agrigento. Several days later, this was repeated at Palermo. In the latter place, the problem of messing was somewhat magnified due to the growth of the Headquarters and Headquarters Company personnel, it was necessary to establish six distinct messes.

Later and Advance CP was established at San Stefano and later moved to the vicinity of Naso. At these sites, the Headquarters Commandant selected bivouac areas, set up the CP, and provided local security with units of the 204 MP Company.

CONCLUSIONS

1. It was found impossible for one officer to perform the duties of TQM, Headquarters Commandant, Company Commander and Billeting Officer.

2. The ship's platoon was inadequate. Upon completion of loading, it was placed on troop detail which lasted until unloading started.

3. The Headquarters Command Ship was found inadequate for the assigned mission; messing, billeting and operating facilities were at a premium.

4. Loading and unloading were both hampered by lack of sufficient personnel.

5. The 1/4 ton truck and trailer proved to be the most valuable vehicle for personnel. Six 2½ ton trucks were sufficient to transport messing facilities, cleaning supplies, and tentage for the initial move ashore but insufficient for an extended move. Additional trucks were needed for enlisted personnel, office equipment, fuel and lubricants.

6. The use of half-tracks for transportation in this Headquarters was found impractical.

7. The Headquarters supply proved satisfactory in the case of rations, two trucks fully loaded, being carried on the LST.

8. The duty platoon, consisting of 22 men, was found insufficient.

9. Establishing the main Headquarters immediately after landing in a war-torn city proved difficult.

10. The Medical Detachment proved to be exactly what was required and very essential.

RECOMMENDATIONS

1. That the TQM officer on the Headquarters ship be a permanent officer of the ship. This officer should work with the units to be embarked and with G-3 concerning the operation of the Headquarters on the ship. Another officer should be detailed as ship's Headquarters Commandant and a third officer should be detailed to assist the TQM officer.

2. The ship's platoon should consist of a minimum of 75 men, and it should remain under the jurisdiction of the TQM who should coordinate its work with the Commander of Troops.

3. That the Headquarters ship personnel be attached to a sub-task force for supply purposes.

4. That the TQM furnish priority in loading and unloading vehicles, that G-3 - G-1 compile personnel lists for each boat, and the troop commander execute unloading.

5. That the use of half-tracks be discontinued in amphibious operations in Army Headquarters.

6. That motor oil for complete change of every vehicle going ashore be carried. Two 3/4 ton weapons carriers should be provided for personnel and equipment.

7. That the duty platoon be composed of at least 30 men under supervision of an experienced non-commissioned officer capable of setting up a CP and operating several kitchens.

JOHN H. OLIN,
Major, Infantry,
Hq. Commandant

REPORT OF THE ORDNANCE OFFICER

Early in February, the I Armored Corps was given its mission in the Sicilian Campaign. The Commanding General then detailed a group of officers to proceed to AFHQ, to represent him in the nomination of troops for Force 343, the official designation of the American forces in the mission. The Ordnance Officer, I Armored Corps, was one of the officers in this group.

The ordnance troop list as finally approved, consisted of the following units:

One (1) Hq & Hq Detachment, Ordnance Bn (MM) w/attchd. Medical
Two (2) Hq & Hq Detachments, Ordnance Bn (Am) w/attchd. Medical
One (1) Hq & Hq Detachment, Ordnance Bn (HM)(Q) w/attchd. Medical
One (1) Hq & Hq Detachment, Ordnance Bn (MM)(Q) w/attchd. Medical
Three (3) Hq & Hq Detachments, Ordnance Bn (M&S) w/attchd. Medical
Eight (8) Ordnance Companies (Am)
Three (3) Ordnance Companies (HM)(FA)
Three (3) Ordnance Companies (HM)(Tk)
Two (2) Ordnance Companies (MTS)(Q)
Four (4) Ordnance Companies (D)
Three (3) Ordnance Companies (HM)(Q)
Five (5) Ordnance Companies (MM)(Q)
Seven (7) Ordnance Companies (MM)
One (1) Ordnance Company (Bomb Disposal)
Three (3) Ord Cos. (HM)(Tk) w/Tk Rec Attached
Three (3) Ord Cos. (MM)(AA)

These ordnance troops were in addition to the organic ordnance service in the tactical units assigned to the corps. After the troop list had been approved, Ordnance units were assigned to sub-task forces for initial assault and follow-up as follows:

JOSS

Assault	Follow-up
2 Ordnance Companies (Am)	One (1) Hq & Hq Det., Ord Bn (M&S) w/attchd. medical
Det., Ordnance Co (MM)(Q)	One (1) Ord Company (MM)

One (1) Ord Company (MTS)(Q)
Two (2) Ord Companies (Depot)
Three (3) Ord Companies (HM)(Tk) w/attached Tk Recovery
Three (3) Ord Companies (Am)
One (1) Ordnance Company (MM)(Q)

In the early stages of the planning, the ordnance units assigned to the sub-task forces were moved wherever possible in order that they might be in close support of the tactical troops. As a result, ordnance units were located all the way from Casablanca, Morocco, to the Tunis-Ferryville-Bizerte area.

Because of the priority for movement of tactical troops, ordnance units were continually set back on the priority list for shipment to Sicily which resulted in only the following units being available for combat maintenance and the mission of rehabilitating the units at the close of the campaign:

Two (2) Hq & Hq Det., Ordnance Bn (M&S) w/attchd Medical
One (1) Ordnance Battalion (MM)(Q) w/attached medical (Hq & Hq Detachment)
Two (2) Hq & Hq Det., Ordnance Bn (Am) w/attchd medical
Four (4) Ordnance Companies (MM)
Five (5) Ordnance Companies (MM)(Q)
Three (3) Ordnance Companies (HM)(AA)
One (1) Ordnance Company (Bomb Disposal)
Two (2) Ordnance Companies (HM)(Tk)
Three (3) Ordnance Companies (Depot)
Two (2) Ordnance Companies (MTS)
Eight (8) Ordnance Companies (Am)

Throughout the entire planning period and actual operation, ordnance troops assigned to the Army were used to augment ordnance service of the sub-task forces as well as their maintenance mission for Army troops.

On April 14, 1943, the Special T/O for I Armored Corps, Reinforced, was approved. The necessity for immediate advance planning placed an unusually heavy burden on the Ordnance Section which was understrength in special technically qualified personnel so that personnel from ordnance units of the corps were placed on special duty with the Ordnance Section to partially ameliorate this situation. Although as soon as a new T/O was approved action was taken to bring this section to full strength, this was not accomplished until the latter part of May due to the necessity of obtaining personnel of proper professional background, capacity, and experience. During the operation, twenty-one officers, three warrant officers, and twenty-seven enlisted men were actually used by the Ordnance Section.

When Headquarters was moved from Rabat, the planning and supply section - Materiel, parts, and ammunition - was set up in Oran. The administrative and maintenance sections and the Headquarters of the Ordnance Section moved to Mostaganem. Daily contacts were maintained between the two offices. Inspection and contact visits were made to all ordnance units assigned to I Armored Corps. During this period, ordnance contact and service parties were inspecting and repairing ordnance equipment of combat and service units of the corps.

Experimental work carried on by direction of the Ordnance Officer under the supervision of the Ordnance Service developed two new weapons which proved highly successful. Both weapons used the 81mm mortar, one consisting of a harpoon type hook attached to a cable to be thrown into enemy wire entanglements; upon being withdrawn, the destruction of the entanglement resulted. The second consisted of using two standard 81mm mortar shells connected by a bangalore torpedo, thus projecting rather accurately from 300 yards with a maximum range of 800 yards approximately 10½ pounds of TNT which exploded on impact. After these weapons had been perfected and test fired, samples were made of the bangalore projectile and furnished to each division to enable them to proceed with their manufacture; the wire entanglement removing unit was produced in quantity by the Base Regiment and distributed to the combat units.

During the latter part of June, the Ordnance Section was again divided. The Ordnance Officer and an officer from the Ammunition Section, a warrant officer from the Supply Section, one stenographer and one driver remained at Mostaganem to accompany the assault when it was mounted; a small liaison group was left at Oran and the balance of the section proceeded to Bizerte to coordinate the last-minute supplies for the troops being mounted from that area and to coordinate the job of pushing Ordnance units, supplies, and materiel to Sicily and filling last-minute requirements of the troops. The first Ordnance Section personnel which did not accompany the assault joined the section at Gela and the remainder joined at Agrigento. Throughout this early period, constant use was made of officers attached from Army Battalion Headquarters to augment the section. The entire Ordnance Section moved to Palermo on 25-27 July.

Until after combat ended in Sicily, a 24-hour ordnance service and supply schedule was maintained, pushing ammunition, supplies, and materiel forward to the using units. Because of the terrain, artillery played a major part in this campaign with a resultant increase in the use of artillery ammunition. The certain solution of the supply problem was only obtained by thorough coordination between the Transportation Section - including Air, Rail, Water, and Truck - the ammunition companies, and the Ordnance Section. Fast moving action provided the Ammunition Section with a real problem. Mixed lot numbers were a normal condition.

Of almost equal importance is ordnance maintenance. A great variety of parts are required to provide coverage for the ordnance equipment of a modern army. Trained ordnance mechanics and supply personnel must be available. Equally necessary is thorough military training of these units so that when operating under actual combat conditions they function smoothly. Generally, these desired conditions were the rule among the ordnance maintenance and general supply organizations.

The thorough planning, particularly with reference to the supply of replacement equipment and spare parts which was accomplished by the Ordnance Section at Oran, paid its dividends in Sicily in that, in general, troops in combat did not have to go without ordnance supplies at any time.

The ordnance units performed well during the combat operations. Many were under fire. One officer and eleven enlisted men were killed and fifty-two officers and men were awarded the Purple Heart.

In the rear areas man power shortage, resulting from shortage of ordnance organizations, was corrected by the use of some 2,100 natives employed as laborers, skilled mechanics, and clerks.

PLANNING AND SUPPLY SECTION

At Rabat, French Morocco, March 30, 1943:

1. Started compiling a list of weapons, armored vehicles and motor transport vehicles in order to plan for an initial base depot stock and maintenance supplies for operation HUSKY. Many of the units assigned to the force were not in the theater or were actively engaged in Tunisia, making it impracticable to receive reports as to major items on hand at the time. Computations for these units were made on the basis of what they were authorized, information being taken from appropriate T/BA's, T/E's, T/O's, Ordnance Equipment Charts and special authorizations.

Left Rabat April 5, 1943, arrived at Oran, Algeria, April 6, 1943:

2. Requisitions for a period of thirty days were computed and typed for initial stockage for the Army Base Depot, using figures compiled as stated in paragraph 1 for a basis. This stockage was based on Addendums to SNL's as prescribed by Standard Nomenclature List and Ordnance Major Item List with maintenance and distribution factors published by the Chief of Ordnance. On or about April 20, 1943, 14 requisitions for convoy UGS-8A totaling 2,952 tons of ordnance supplies were forwarded to SOS, NATOUSA. These requisitions covered items which were not available from stocks of supplies in North Africa, such as waterproofing kits, Very pistols, rechargers for fire extinguishers, carriages, and cradles for machine guns, etc. On or about May 8, 1943, six requisitions for convoy UGS-9, a total of 115 tons of ordnance supplies, were prepared. The requisitions covered essential critical items which were not available in North Africa. These requisitions were also forwarded to SOS, NATOUSA. The following table shows requisitions submitted for initial depot stocks, subsequent maintenance and replacement stocks, and depot equipment for the period D # 15 to D+165.

CONVOYS	REQUISITIONS	QUANTITY	APPROX. DATE SUBMIT.	PERIOD	TONNAGE
UGS-11 & 12	1 to 50	50	4-18-43	D+15 to D+45	41,960
UGS-13 & 14	51 to 283	233	5-17-43	D+45 to D+75	32,891
UGS-15 & 16	284 to 464	181	6-15-43	D+75 to D+105	21,800
UGS-17 & 18	465 to 647	183	6-30-43	D+105 to D+135	22,000
UGS-19 & 20	648 to 841	194	7-15-43	D+135 to D+165	21,900
				TOTAL TONNAGE	140,551

TABLE #1

On April 15, 1943, a separate Depot Section was established to submit requisitions as listed above. This section utilized the services and experience of ordnance maintenance and depot personnel who had taken an active part in the North African operation. Using charts prepared by the Planning Section, a careful check was made on maintenance parts and spare major items required for all items of Ordnance equipment known to be in the theater or scheduled to arrive in time to be used in the HUSKY operation. Each vehicle, weapon or instrument was studied seperately and a thirty day maintenance stock was requisitioned based on SNL Addendums modified by the experience and knowledge secured during the North African campaign. Each seperate SNL Group was covered by a separate requisition, using as a basis the number of that item which would be maintained during each 30-day period. On requisitions for tools and common items, a complete study was made of all major items to be requisitioned; the advice of maintenance units was of particular value. In all requisitions, every effort was made to insure an adequate supply for these items which had been scarce or not available at all in North Africa.

The Planning Section continued to modify its weapon and vehicle lists and also turned to compiling what was to be known as 'Assault and Follow-up Kits'. The quantity and type of maintenance parts that were included in these kits were essential, fast moving, unit assemblies, standard hardware, special tools and cleaning and preserving materials, etc. The information as to what were fast moving parts was derived from reports furnished by the II Corps which was engaged with the enemy at the time in Tunisia and from various ordnance maintenance and depot companies and two technical observers from the O.M.C. The Assault Kits were to be set up and packed in such a way so that the heaviest one could easily be carried by two men, no assault kit to exceed the weight of 100 pounds.

In addition, a spare major item list was prepared using maintenance and replacement factors and capacity for movement of such by Ordnance light, medium,

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

and heavy companies. From this list were prepared phased requisitions for the weapons which were requested shipped direct to the various ordnance companies. These major items included all weapons up to and including 81-mm mortars.

A list of critical items for MTS companies was also published for their information in order that a more balanced stockage would be carried to meet requirements in the HUSKY Operation.

The Planning Section prepared forms for Ordnance Status Reports required by Force 141 and made plans to keep record of the reports.

Arrived at Biserte, Tunisia, June 20, 1943:

3. Requisitions for convoy UGS-21 and 22 were prepared by personnel of the 6625th Base Area Group (Prov) with the aid and advice of personnel from the Ordnance Section, I Armored Corps (Reinf). These requisitions were partially completed by July 10, 1943.

The ordnance requisitions which were submitted to the Commanding General, SOS NATOUSA, for each of the two convoys averaged 1,800 pages with the weight for the original copy of approximately nine pounds and all seven copies of approximately fifty-two pounds.

On or about July 12, 1943, reconnaissance was made in Sicily to plot out locations for supply points. Locations selected were at Licata which were placed under control of the 1st Engineer Special Brigade.

An Army Collecting and Evacuating Point was established at Caltanissetta on August 3, 1943 under jurisdiction of the 1st Engineer Special Brigade. The Army Base Depot, and Evacuation Depot, Class II and IV Supplies, opened at Palermo, August 3, 1943. Other collecting points for ordnance materiel were opened at Sperlinga and Cefalu on August 10, 1943.

Daily inventories of major items and major unit assemblies received from depots were posted to stock record cards maintained by this section. All captured enemy material and allied salvaged material were likewise inventoried daily at collecting points and depots and posted to another set of stock record cards. These were then used as a basis for making reports to higher headquarters.

During the period of July 28th to August 18th, 1943, the following allocations were made of Ordnance major items by the Ordnance Section, Seventh Army.

July 28th to August 7th: REPLACEMENT OF MAJOR ITEMS

UNIT	ITEM	QUANTITY
II Corps	Truck, 2-1/2 ton, 6x6, cargo	50
	Motorcycle, solo	1
	Trailer, 1/4 ton	30
	Truck, 3/4 ton, 4x4, ambulance	7
	Truck, 3/4 ton, 4x4, WC	12
	Carriage, motor, multi-gun, M15	3
	Carriage, motor, multi-gun, M13	2
	Truck, 3/4 ton, 4x4, C&S	4
	Truck, 1/4 ton, 4x4	10

OPERATION OF ARMY ORDNANCE

DEPOT #1 PALERMO SICILY

The Army Ordnance General Depot #1 at Palermo, Sicily, was established and operated by the officers and personnel of the 201st Ordnance Company (D) and the 339th Ordnance Company (MTS). On July 31, 1943, one-half of the 339th Ordnance Company arrived in Palermo and was assigned for bivouac and operation out of vans to an area near the port. On the following day, one-half of the 201st Ordnance Company arrived and was assigned for bivouac in the S.A.A.S. Aircraft Plant and for operation out of vans. On August 3, one-half of the 339th Ordnance Company moved from the port area into the aircraft plant. Both of these half companies had landed at Syracuse in the southeastern part of Sicily on July 21, 1943, and them operated for a week beginning July 23 at Licata and Gela on the south Sicilian coast. They had come overland with their equipment of vans and stock to Palermo. On August 7, the other half of the 201st Ordnance Company arrived at Palermo by L.S.T. from Biserte. On August 10 the other half of the 339th Ordnance Company arrived from Biserte.

On August 8 a full survey of the aircraft plant was made. This survey revealed that there were sixteen useable warehouses in the plant containing a total floor space of some 245,000 square feet, and one office building containing floor space of some 4,000 square feet. The area and warehouses were sketched according to scale for purposes of clarity. A meeting of all officers and key non-commissioned officers was then held and a plan assigning the use of each building was adopted.

For the most part, however, the warehouses were at this time filled with the machinery and materiel of its former aircraft manufacturing occupants. During the week following some 600 tons of this materiel were disposed. Most of it went to the United States Army Air Corps for reclamation. Some excess lumber was taken by the United States Engineer Corps and several hundred lockers and other miscellaneous materiel went to the Army Quartermaster Corps. Numerous truck loads of scrap lumber were removed to a vacant lot for use by the civilian population. Excellent cooperation was received from all of the other Army units mentioned in this removal and reclamation work.

The need for additional storage space, satisfactory in the open, was immediately apparent. Arrangements were made to procure and put into use some 22 acres of open field immediately west of the aircraft plant. With the help of the Army Engineer Corps a road was opened from the aircraft plant area into the open field. The open field was in turn walled in to make it possible to retain the advantage of one unit.

During the first few days of August an open field of some 15 acres had been procured for use as a Vehicle and Artillery Pool near the airport. This area was found to be a little too small. Moreover, on August 7, the Air Corps requested its evacuation. On August 12, a 40-acre field near Pallavicino, approximately six miles from the main depot installation, was procured and all depot stock vehicles and rolling artillery were moved into it.

The basic plan of our operations was adopted on August 10. Each of the buildings in the principal depot area were assigned a letter and particular use. Principal streets were established and made one-way in order to expedite the flow of traffic through the area. The depot office was established in the office building on the main street near the entrance of the depot area. All requisitions from incoming units were received here. The Shipping and Issues department was established at the other end of the principal street near the exit gate. All units drawing ordnance materiel from this depot were held upon their presentation of the requisition at the depot office when to call for materiel at the Shipping and Issues department. 'Rush' requisitions were processed in one-half hour; ordinary and less urgent requisitions were processed in 24 to 36 hours. All receiving was done by a section set up for this purpose in a clearly marked building and lot

SECRET

THIS PAGE IS DECLASSIFIED IAW EO 13526

adjoining the main street. The 22 acre field adjoining the principal depot area on the west was divided into 14 lots, marked from one to fourteen respectively. Each of these lots was assigned a particular use, the overall purpose of which was to take care systematically of excess and bulk storage of regular Ordnance properties which would not be injured by exposure to weather, of the three classes of salvage and captured enemy vehicles and artillery.

Each of the 11 officers and 380 enlisted men of the two companies were assigned to specific tasks. Because the operations were of such large scale, the use of Italian laborers was necessary. Starting on August 9, between 350 and 400 such laborers were used daily on tasks ranging from policing latrines to working in the carpenter shop and repairing weapons.

All warehouses had been put into use by August 15 and operations were then proceeding smoothly.

During the period August 3 to August 18, 1943, inclusive, the Depot handled 1549 requisitions totaling 404 tons of ordnance spare parts and major assemblies, and 1556 tons of vehicles and rolling artillery. During this same period 5443 tons of ordnance spare parts and major assemblies and 2291 tons of vehicles and rolling artillery were received. Some 180 tons of materiel were brought to the Depot in their vans by the two Depot Companies. Large sea shipments of stock first began to arrive at the Depot on August 9, 1943.

The operation of the Army Ordnance Depot #1 was turned over to the 6625th Base Area Group (Prov) on August 21, 1943.

AMMUNITION SECTION

On April 20, 1943, at Oran, preliminary work was started on ammunition supply for the several phases of the HUSKY Operation.

Using figures compiled by the Planning Section showing total quantities of each type of weapon to be used in the various forces, and number of units of fire as prescribed by the Administrative Order, phased requisitions were submitted on May 24, 1943, to supply two and one-third (2-1/3) units of fire combat loaded, in addition to organic load, for the troops in the assault.

Phased requisitions were submitted for troops in the first follow-up to carry one and one-sixth (1-1/6) units of fire for weapons in their possession plus one and one-sixth (1-1/6) units of fire for weapons of the assault troops.

Phased requisitions for troops in the second follow-up provided for one and one-sixth (1-1/6) units of fire for weapons in their possession plus one and one-sixth (1-1/6) units of fire for weapons in the assault and first follow-up.

The phased requisitions for the third follow-up provided for one and one-sixth (1-1/6) units of fire for the entire force.

These phased requisitions were broken down by the sub-task forces CENT, DIME, JOSS, KOOL, and WOLF. They were submitted to the Commanding General, SOS, NATOUSA, and were to be filled from ammunition stocks already in North Africa or ammunition arriving from the United States prior to D Day.

In addition to the above, requisitions were submitted for one unit of fire for a Regimental Combat Team, to be placed at Kairouan Airport for transport by air in case of emergency.

Units of fire were as prescribed by letter, War Department, The Adjutant General, file AG 471 (2-13-43) OB-S-D-M, dated February 16, 1943. Rate of expenditure was estimated at one-third (1/3) unit of fire per day for first seven (7) days; one-sixth (1/6) unit of fire per day for the next fourteen (14) days; one-third (1/3) unit of fire per day for subsequent fourteen days; and one-sixth (1/6) unit of fire per day thereafter. The objective was to build up a reserve of seven (7) units of fire for Seventh Army by D + 40.

In order to insure that an automatic supply of ammunition would be furnished, under any eventuality, a letter of instructions accompanied by graph indicating amounts of ammunition to be shipped from North Africa and dates same should arrive at Sicily, was furnished SOS, NATOUSA. A list showing the quantities and types of weapons to be in the hands of each sub-task force was also attached. Two graphs for supply of ammunition for each sub-task force were furnished. One of the graphs indicated amounts and dates ammunition should arrive in Sicily in case UGS 11 and 12 were unloaded in North Africa. The other chart indicated amounts and dates when ammunition should arrive at Sicily in the event UGS 11 and 12 could be unloaded in Sicily.

Also during the period from May 1, 1943, to May 14, 1943, requisitions were prepared for ammunition to be shipped from the United States on UGS 11 and 12. These requisitions were submitted to Commanding General, SOS, NATOUSA, for four (4) units of fire for Force 343 to be shipped on UGS 11, and for three units of fire to be shipped on UGS 12. All ammunition was requested by rounds and types. The requisitions forwarded to PEMBARK by the Commanding General, SOS, NATOUSA, failed to list ammunition by rounds and type but instead called for four (4) units of fire to be shipped on UGS 11 for all weapons of the Force. Therefore, when units of fire were computed by PEMBARK, percentages of all types including H.S. Gas (Toxic Chemical), as designated by the War Department as a unit of fire, were considered in the computation.

Information (copy of radio from NATOUSA to SOS, NATOUSA) to the effect that H.S. Gas Shells were being shipped on UGS 11 first reached this headquarters on June 8, 1943. Ordnance Officer, SOS, NATOUSA, was informed on the same date that there was no requirement for H.S. Toxic Chemical Munitions to be shipped to Sicily on either UGS 11 or UGS 12. Realizing the danger of H.S. Gas shells inadvertently getting in the hands of artillery batteries actively engaging the enemy, immediate steps were taken to intercept all this ammunition. All toxic gas shells that arrived in Sicily was either shipped to North Africa or placed in a specially prepared toxic gas dump under supervision of Chemical Warfare Troops.

Due to limited tonnage capacity of UGS 12, PEMBARK wired the Commanding General, SOS, NATOUSA, asking permission to reduce ammunition tonnages to 50% of original requirements. This was coordinated through this headquarters and authority for the reduction was granted. Manifests of UGS 12 indicate that in making the reduction, consideration was not given to securing a balanced shipment. Reduction was made by deleting heavy and medium artillery ammunition from requirements instead of reducing all types proportionately, thereby an excess of small caliber ammunition was delivered to Sicily.

A requisition for three (3) units of fire for Force 343 was submitted to Commanding General, SOS, NATOUSA, on May 21, 1943. This requisition was to meet anticipated expenditures and was to be shipped from the United States on UGS 13.

Due to the rapid progress of the operation, expenditures of ammunition were not as great as anticipated. On July 29, 1943, a message, by air courier, was sent to the Commanding General, SOS, NATOUSA, requesting that plans for automatic supply of Ordnance Supplies should be voided, and that special requirements after the arrival of UGS 11 would be obtained by coordination with the Commanding General, SOS, NATOUSA. This message was confirmed by radio message to the Commanding General, SOS, NATOUSA, dated July 31, 1943.

A.S.P.'s and Depots were established and closed as indicated:

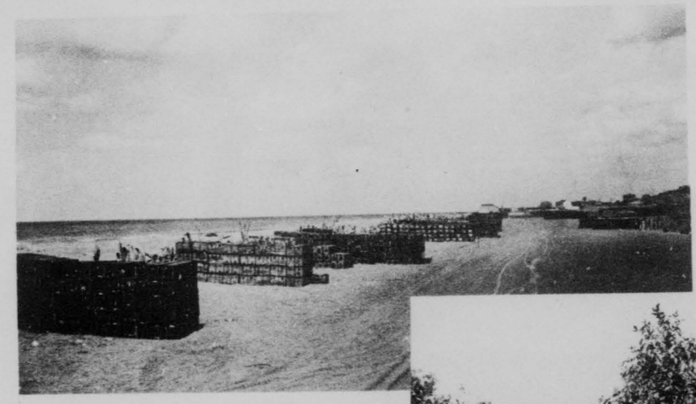
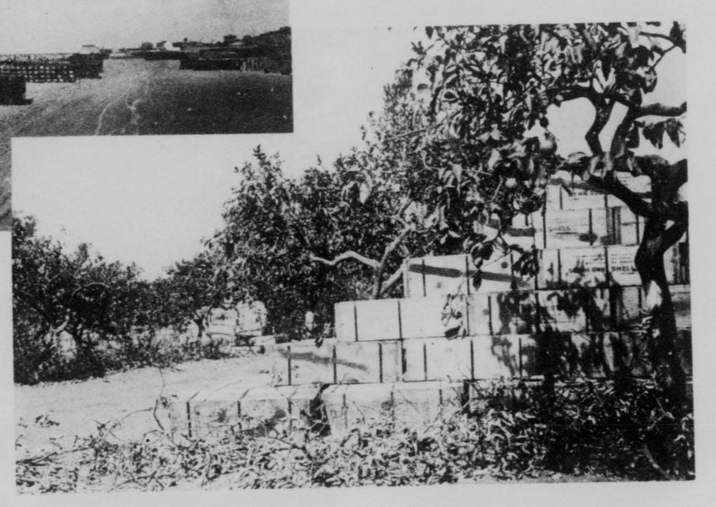
* Later designated as Base Ammunition Depot #2



** Later designated as ASP #6

As the campaign moved to the north coast and north central part of the island, Ammunition Supply Points were established by Ordnance Ammunition Troops under the control of Seventh Army. ASP #13 was established near Termini Imerese to store ammunition being unloaded at that point. ASP #14 was established ten (10) miles east of Palermo to provide storage for ammunition being unloaded in the port of Palermo. ASP #15 was established at railhead at Campofelice and supplied by rail from the Port of Palermo. ASP #16 was established near Nicosia and was stocked by truck from railhead at Pirata where it was brought by rail from the south coast. ASP #17 was established just west of San Stefano to provide storage for ammunition unloaded from LST's and to supply troops operating east of this point. Later ammunition was shipped by rail from Palermo to railheads at Tusa and San Stefano. ASP #18 was established on August 15, 1943, at a point four (4) miles west of Capo d' Orlando and partially stocked by ammunition unloaded from a freighter at that point. ASP #19 was established near Barcellona on August 26, 1943, primarily with ammunition for the 155-mm Howitzer M1918 and 155-mm Gun, M1.



Upon completion of active operations, ammunition was ordered consentrated in the following depots and ASP's:

	PLACE	OPERATED BY
BAD #1	Cerda	6625th Base Area Group
ASP #2	Palermo	6625th Base Area Group
BAD #3	Licata	6625th Base Area Group
ASP #4	Campofelice	Seventh Army

Provisions were made for the concentration of captured enemy ammunition at various ASP's, stored in special areas at safe distances from our own ammunition. An estimate of tonnage of captured enemy ammunition was approximately sixty thousand (60,000) tons. The majority of this was medium and large caliber artillery ammunition including fixed, semi-fixed and separate loading rounds.

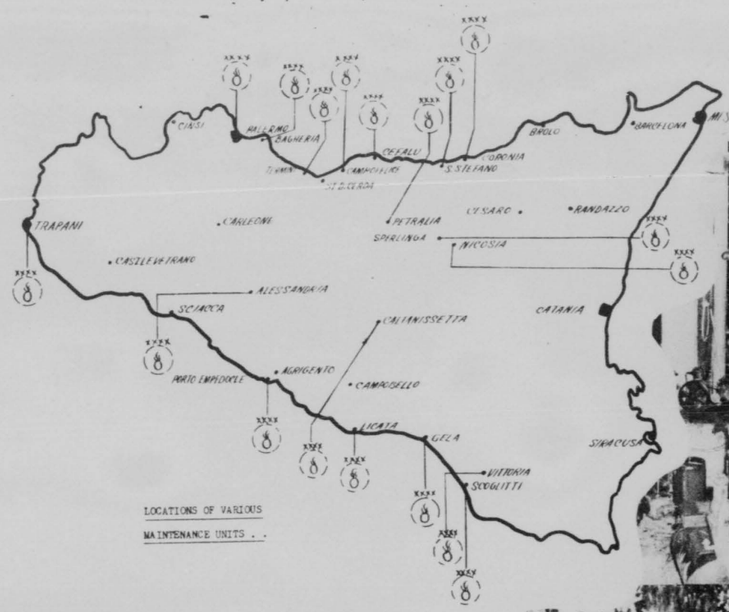
MAINTENANCE SECTION

The prime mission of the Maintenance Section, as well as all other ordnance activities, is: "PUSH MAINTENANCE SERVICE TO TROOPS IN THE FORWARD ECHELONS AT ALL TIMES UNDER ALL CONDITIONS." This standard operating procedure at all times, particularly during this operation, has proven sound.

Throughout the maintenance organizations, skilled mechanics for every type ordnance materiel had carried on these contact and service operations continuously. Approximately 12,000 man hours per day were spent on 3rd and 4th echelon maintenance. Technical command inspections, spot-check inspections and maintenance were carried on throughout all the units of the Seventh Army. These operations were carried on continuously until D Day.

Detachments of Ordnance Maintenance troops were in the initial landings carrying hand tools. The ordnance service provided in this manner was responsible for overcoming many stoppages, contributing materially and directly to the success of the operation in the initial stages of the campaign.

Immediately following the assault, improvised mobile shops were set up and the scope of maintenance operations increased accordingly. Ordnance maintenance service extends from watch repair through field ranges, wheeled and track vehicles to tanks, field artillery and amphibious vehicles.

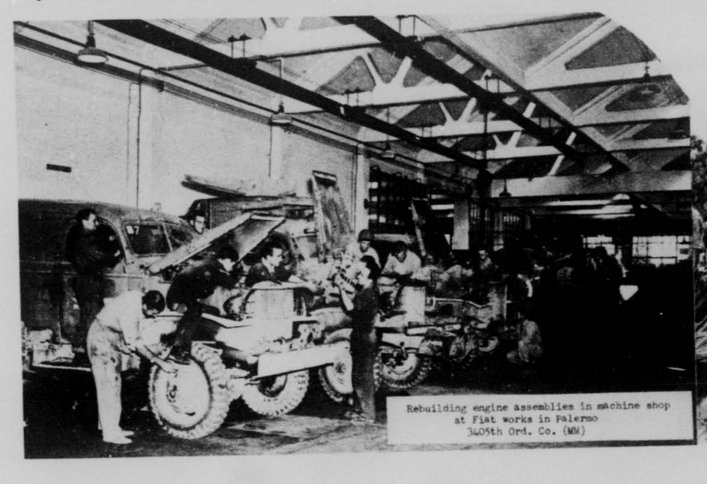


Ordnance maintenance personnel and materiel were assigned to the ports in Sicily to assist in the unloading, shipside servicing, and evacuation of ordnance materiel and vehicles.

Some captured materiel was used by our forces. The maintenance of this materiel presented problems as to parts supply which was overcome by cannibalism.

After the close of the campaign, maintenance tasks tripled. Two Infantry Divisions, an Airborne Division, an Armored Division and a majority of all anti-aircraft and coast artillery units were contacted, serviced, and repairs and maintenance accomplished.

A Bomb Disposal Company was divided between the several sub-task forces. They removed and destroyed some 60 tons of unexploded enemy and allied bombs as well as a considerable quantity of unserviceable enemy ammunition and grenades.



The Maintenance Section, together with personnel from maintenance units of the Seventh Army, work closely with the Ordnance Intelligence Team from Allied Force Headquarters in procuring and cataloguing in preparation for shipment captured ordnance material and equipment.

LESSONS LEARNED

1. Variation from T/Bs and T/E should be avoided when ever possible. This results in difficulty of ammunition supply, maintenance, replacement and possible depletion of reserve stocks below a safe level.

2. When adding or substituting a new weapon, it is necessary to insure adequate ammunition supply, spare parts, reserve stocks, proper prime movers, and firing tables.

3. Ammunition supply, to be most successful, must follow the normal ordnance supply system.

4. Consideration must be given to special terrain and other conditions in planning replacement equipment and parts.

5. The importance of proper air and oil cleaning devices and prompt replacement and supply of filter elements cannot be overestimated.

6. Modern warfare emphasizes the artillery weapons. The proportions of artillery ammunition must be determined after a careful analysis of the probable tactical employment of artillery for the particular operation.

7. An adequate Army Ordnance Staff must be provided. In my opinion, the optimum for such a staff will consist of twenty-one officers, three warrant officers, and thirty-five enlisted men.

8. Ammunition companies must accompany any large amphibious assault.

9. In amphibious operations, light and medium maintenance personnel should arrive in the combat area as soon as practical after the assault group.

10. In amphibious operations, ordnance heavy maintenance, unless required earlier to support self-propelled equipment, should arrive in the combat area after about 30 days.

11. Major weapon and vehicle casualties are generally complete casualties with little chance of economical repair; therefore, spare parts should be limited to organic loads in Line organizations and Ordnance maintenance organizations for the first 30 days, supplemented by generous replacements of vehicles and complete weapons. All replacements must be complete ready for combat. Depot supplies, including replacement tool sets, should arrive in the theater after 30 to 45 days.

12. During combat, Ordnance Service must be pushed as far forward as practical. Replacement vehicles and weapons must be furnished on demand. As soon as a unit is withdrawn from the line, it must be overhauled and excess equipment returned to the pool.

13. A vigorous, forceful policy of pushing Ordnance Service of all types forward to the troops must be followed at all times, and a case must not arise of troops in combat having to come to the rear for supplies. Adequate ordnance troops must be made available to permit the execution of this policy.

14. Extended supply lines requires improvision with complete coordination between Ordnance and Transportation Services. This was exemplified in the Sicilian operation where the length of the supply lines at various times was equivalent of an advance through France into Germany.

RECOMMENDATIONS

1. That in future operations, an adequate, thoroughly trained and experienced Army Ordnance Staff be available to plan and prepare for the operation immediately after the assignment of the mission.

2. That reasonable numbers of ordnance supply and maintenance troops be placed under Army control sufficiently in advance in order that the Army may coordinate their supply and training to insure that they may fit smoothly into their assigned role.

3. The relations between Ordnance Service and Transportation Section, G-4, is vital. These staffs must have adequate training in combined operation prior to an operation.

4. That Base Shop battalions arrive as soon as the situation permits to overhaul and preserve our equipment and collect and preserve enemy equipment.

T. H. NIXON,
Colonel, Ordnance Dept.,
Ordnance Officer.

Prisoner of War Installations
Straggler Patrols and Collecting Points

The Provost Marshal Section began preparation of plans for execution of its functions upon notice that the I Armored Corps, Reinforced, expected to participate jointly with the British in an operation against the Axis forces on the Island of Sicily.

The initial plan of establishing rear echelon Prisoner of War cages near Bizerte was discarded when decision was made to turn all Prisoners of War over to the Navy in Sicily, who would convoy them to base sections in Africa.

In the revised plan, prisoner of war cages were to be initially established on the shore of Sicily after beach heads had been secured at points convenient to Joss and Dime operations (Gela and Licata). Personnel estimated for this operation was as follows (in addition to the organic Military Police organizations):

Three Military Police Prisoner of War Escort Guard Companies, two of which were to guard the two major Sub-Task Force Prisoner of War cages, and the other to escort prisoners of war to cages or to the evacuation point.

Two Military Police Prisoner of War Processing Platoons, one of which to be assigned to each Sub-Task Force cage for documentation of prisoners of war before evacuation.

One Corps Military Police Company for traffic control in and near the Command Post and Army straggler control.

Two Military Police tactical Battalions, one to be used to reinforce the four Sub-Task Forces; the other to police and control Army area traffic; then, when assault forces had passed, to cooperate with Civil Affairs in the control of captured territory, the reorganization of civil police forces, and for possible emergencies.

Initial plans covering landings on the west and northwesterly section of Sicily were changed to the southerly shore of the island on beaches extending east from Licata to the vicinity of Punta Secca. The Military Police plan was changed accordingly.

On 21 May the Provost Marshal received the final troop list for the operation. This indicated withdrawal of the 101st Military Police Battalion. The Provost Marshal at once requested another tactical Military Police Battalion to replace the 101st. No other battalions were available within the theater, and the request could not be granted. Recommendation was then made for attachment of two additional platoons to the 204th Military Police Company. Two officers and ninety men from tank and tank destroyer battalions reported to the 204th Military Police Company for temporary duty (for purpose of the expected operations) about the middle of June. Military Police training and indoctrination of these attached troops was begun at once.

Conferences with Provost Marshals of subordinate units were instituted relative coordination of their plans with the general scheme for employment of the Military Police, and especially the handling of Prisoners of War. Annexes 1 to 5 inclusive explain the detail, procedure and forms for handling of prisoners of war.

As Civil Affairs officers did not join Force Headquarters until late in the planning phase, time for full coordination between Provost Marshals and Civil Affairs officers was not available.

From all of the conferences, and from information available up to this point, the Military Police Plan was published and distributed to all echelons. (See Annex No. 6.)

It had been originally recommended that Naval personnel guard prisoners of war in their evacuation from Sicily to North Africa; however, instructions were later received that the task force would have to provide guards for these prisoners, and would be responsible for boat guards from Sicily to North Africa. This resulted in publication and promulgation of an amendment to the Military Police Plan (See Annex No. 7).

Personnel of the Provost Marshal Section entered the operation in three groups; the first (two officers and two enlisted men) aboard the Flagship U.S.S. Monrovia; the second (one officer and one enlisted man) aboard the Headquarters L.S.T. 325; and the third (one officer and three enlisted men) with the rear echelon of Headquarters, which remained at Bizerte until D plus four, when it moved to Sicily on L.S.T's.

The forward groups went ashore on D plus one and established headquarters at the rear command post in Gela. Only the forward group of the 204th Military Police Company, consisting of three officers and 145 men, was available to Army headquarters at this time, and the need for additional personnel, especially for security of vital installations, was urgent. Besides control of military traffic, keeping roads clear of native horse-drawn vehicles engaged in evacuation, and the control of stragglers, the Provost Marshal was charged with the guard of two echelons of the Army headquarters, the billet of the Commanding General, and old ammunition dumps and headquarters left behind by the retreating enemy. Many deposits of enemy hand grenades, ammunition, small arms, stores of land mines, and field pieces were scattered in buildings in town and in the fields on the plain behind the City. To prevent accidents and possible sabotage, these dumps required guards for which no troops other than the Military Police were available. The 204th Military Police Company met all requirements by working details in six-hour shifts until assistance was obtained from a company of the 82d Airborne Division, which was re-organizing at Gela. The latter troops took over much of the guard, freeing the Military Police for their more normal functions.

Lines of communication at this time were comparatively short, as enemy resistance was strongest in the vicinity of Gela. Distances from the City to the forward lines were not great enough to make the straggler situation very much of a problem. The few stragglers encountered consisted, in general, of individuals and small groups left behind to guard dumps and beachhead positions by assault units as they progressed inland. These stragglers were in nearly all cases easily directed to their organizations, often on foot, when parent unit was in the immediate neighborhood. Others were returned to their organization in Military Police transportation, or on vehicles from their units coming to Gela for ammunition, rations, or water.

The military police units attached to the sub-task forces were, during this period, operating the Prisoner of War system and control of areas taken and occupied by these forces. Army control at this point did not extend beyond the immediate vicinity of Gela, the beachhead extending inland fan-wise for only about eight kilometers from the city.

Prisoners of War were being evacuated by each sub-task force from its own beachhead direct to North Africa. An Officer from the Army Provost Marshal Section visited the other beachheads, finding that in many instances prisoners were being loaded on boats without nominal rosters having been made. Because of this, no accurate record is available as to the number of prisoners evacuated to North Africa in the early stages of the invasion.

On 15 July, the first of the Army Prisoner of War cages, with a capacity of 5,000, was opened on the plain behind Gela, to relieve the Dime Force, which had been using a small stockade in a stadium in the City. The 342nd Military Police Escort Guard Company and an unnumbered Prisoner of War Processing Detachment were relieved from attachment to the II Corps and returned to army control for operation of the Army cage at Gela.

Water and rations being difficult to supply at the Army cage behind Gela, on account of the lack of sufficient transportation, it was decided to continue the use, as long as practicable, of the original stockade in the City, which had a direct water supply, was closer to the dumps, and very near the beach from which prisoners were being evacuated. Fortunately, the prisoner turnover was rapid enough to permit use of the original stockade throughout the operation until it was closed on 28 July.

Need for personnel to guard prisoners on vessels enroute to Africa was seen. Request was made and granted for late-arrival troops from North Africa to be immediately sent to Sicily for return with prisoners as boat-guards. Four hundred men and four officers, comprising two equal groups, from tank destroyer units were sent from Africa for this purpose.

The speed with which the task forces were advancing had resulted in numerous requests for establishment of Army cages at additional points to which combat units could evacuate their prisoners. On 18 July, another Army stockade was opened at Licata, and on 19 July the third Army cage was opened at Porto Empedocle. Requests for Army cages at Sciacca, Canicatti, Caltanissetta, and Campobello were also received in approximately the order mentioned. With the exception of Sciacca, all of these points were inland, and the establishment of Army cages thereat was not considered advisable for the following reasons:

1. Personnel was insufficient for operation of Army cages already established, which had necessitated the attachment of personnel from combat units.

2. All available transportation was with combat units, so that movement of prisoners from inland cages to ports and beachheads could not be practicably accomplished.

3. Proper operation and control would have been impossible due to shortage of supervisory personnel.

Upon opening the Licata cage, the 379th Military Police Escort Guard Company and the 264lst Prisoner of War Processing Platoon was relieved from attachment to Joss Force and returned to Army control. Detachments from these units, together with part of the attached boat guards, were sent at once to Porto Empedocle to operate the new stockade at that point. Another small detachment was sent to Sciacca to assist the 82d Airborne Division in processing their prisoners and to evacuate them from Sciacca to the Army cage at Porto Empedocle.

During the period 20-23 July the Army headquarters moved from Gela to Agrigento. At this time the first definite straggler line was established, operating along the Army rear boundary (Route #115 from Agrigento to Gela), with a collecting point at Agrigento.

Hospitals brought released patients to the Provost Marshal for their return. In one instance, just prior to leaving Gela, three truckloads of approximately sixty hospital evacuees, all from different organizations, were left at the rear command post late in the afternoon. A place had to be found for them to spend the night; rations and water were provided, and the men sent to their units the following day by stopping vehicles which were going in the directions of the divisions of which the units to which these men belonged were a part. Replacement or Casual Battalions, through which such individuals should have been returned to their units, were not in operation. The Provost Marshal thereupon began the development of a system through the Military Police straggler collecting points for the return of hospital evacuees with the least delay.

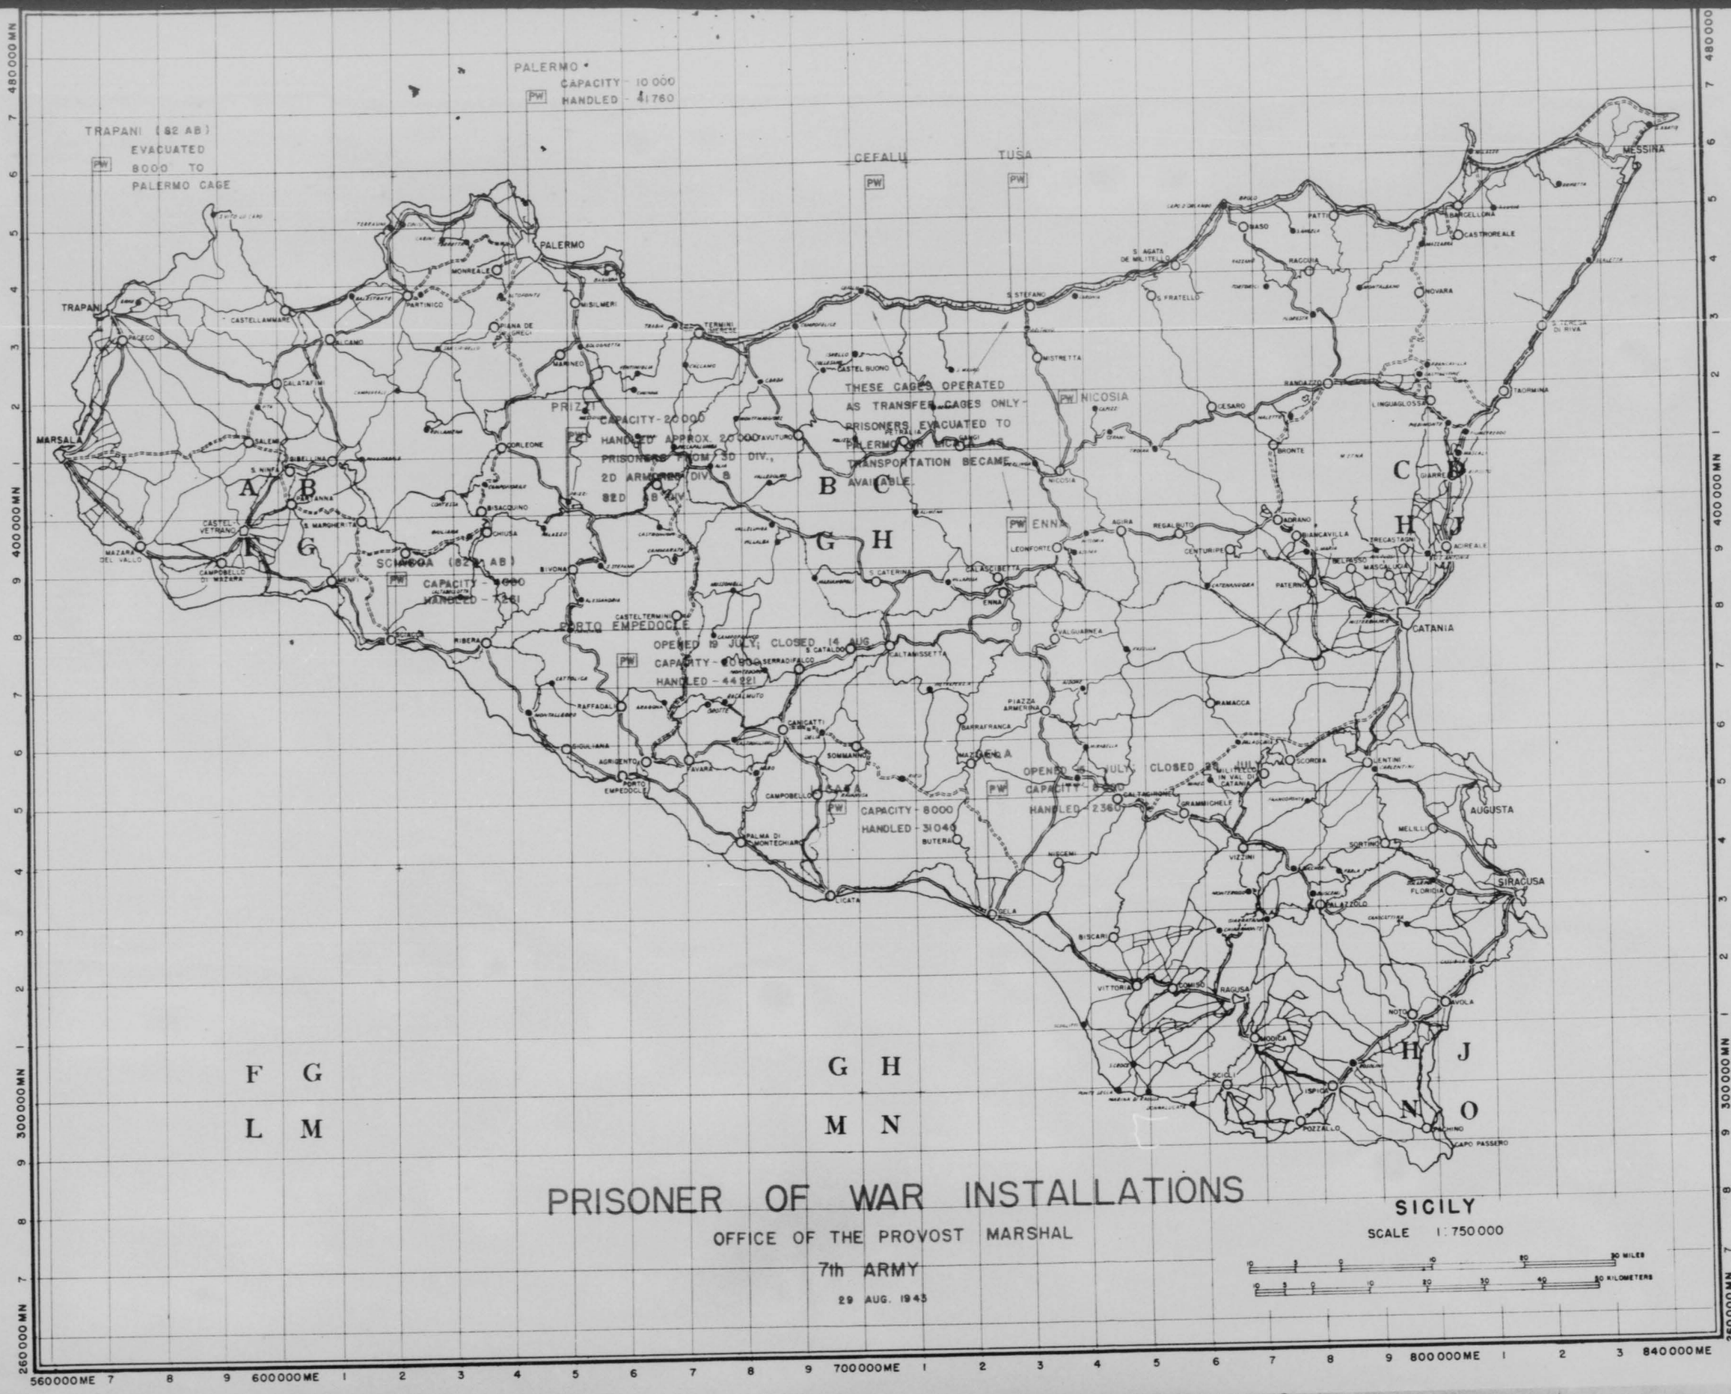
During the period 25-26 July, the Army Headquarters moved from Agrigento, establishing a rear command post in the Postal, Telegraph and Telephone Building, and the forward command post in the Palace at Palermo.

The 342nd Military Police Escort Guard Company and an unnumbered Prisoner of War Processing Detachment moved to Porto Empedocle. Detachments of the 379th Escort Guard Company and the 264lst Processing Platoon, which had been at latter point, rejoined their units at Licata.

During occupation of western end of the island, some twenty thousand (20,000) captured enemy troops had been concentrated at Prizzi, centrally located to the south of Palermo. As combat units moved to the east there was again a shortage of transportation for supplies and evacuation of prisoners to ports. The Prizzi cage was closed, the prisoners being evacuated to Palermo and Porto Empedocle as transportation became available.

Authority was now received for the parole of all prisoners whose permanent residence was in Sicily. Such prisoners were released direct from the cages under supervision of officers who had been especially trained in prisoner of war administration. Instructions for parole are outlined in Annex 8, and the form for Application for Parole is shown as Annex 9.

Of a group of some five thousand (5,000) prisoners held at Trapani, those eligible were paroled and released on the spot. The balance were taken to Palermo for evacuation.



An additional problem was the return to their units of hospital dischargees, which had become critical by this time, the number of released patients at peak periods amounting to as many as 150 daily. With the installation of Army supply points at Cefalu and in the vicinity of Enna, straggler collecting points were set up at these points as well as at the main supply point at Palermo, to route this personnel back to their units. Approximately 800 stragglers were handled through these collecting points. Hospitals in Palermo were instructed to deliver their discharged patients to the Local Class 1 Dump, where the Military Police took charge and secured transportation to their units for them on the daily trains and ration trucks calling at that point. Written instructions were furnished military policemen operating these collecting points, and frequent inspections made with view to improving noticeable deficiencies in the system. (See Annex No. 10). As personnel learned from experience, the operation of straggler control continued to improve throughout the campaign until its close.

As the combat troops progressed eastwardly, requests began to come in for

THIS PAGE IS UNCLASSIFIED

new Army Prisoner of War cages in forward area. The problem was met through establishment of transfer cages in the vicinity of the forward Army supply dumps. The first of these were at Cefalu and Enna. Combat troops brought their prisoners to these cages on empty trucks moving to the rear for supplies. They were then transferred to southern areas. These transfer cages were moved forward as the Army supply line advanced. At the end of the campaign, transfer cages were in operation at Tusa (railhead for S. Stefano), Nicosia and Enna.

Shortly after Army Headquarters moved to Palermo, fifteen platoons of military police boat guard personnel arrived at the port aboard two vessels. These men were at once detailed to supplement the hard-pressed guard personnel while waiting for shipping to evacuate prisoners to North Africa. This employment consisted of placing them on the supply trains to pick up and return prisoners from the forward Army evacuation cages.

The Army straggler lines and collecting points also followed movement of Army supply points, and at the close of the campaign were operating at the same points as the Prisoner of War transfer cages.

Transfer, paroling and evacuation of Prisoners of War had progressed during the first weeks of August to such a degree that Army cages at Sciacca, Porto Empedocle, and Prizzi could be closed out on the 12th, 14th and 15th, respectively. The remaining evacuation stockades were at Licata and Palermo only. The 342nd Military Police Escort Guard Company and the unnumbered Prisoner of War Processing Platoon were moved from Porto Empedocle to Tusa where they remained until the close of the campaign, when they were returned to the Palermo stockade.

Annex No. 11 lists statistical data reference Prisoners of War processed through the various cages as of the close of the campaign. Annex 12 shows the Straggler Patrols and collecting points in Sicily.

LESSONS

I. Coordination with other sections of the headquarters, particularly Civil Affairs, and Counter-Intelligence Corps, and with the Provost Marshals of lower units, is essential for proper planning and execution during the operation.

II. The Military Police personnel and units allotted to the Army for the operation was not sufficient to efficiently carry out the duties which it was called upon to perform.

III. The personnel of the Provost Marshal section was too small to permit adequate supervision of all the Provost Marshal activities.

IV. Transportation for moving Prisoner of War Escort and Processing personnel, rations and water for Prisoners of War, and transportation of Prisoners of War was insufficient.

V. Army Prisoner of War cages should be located near rail or water transportation unless organic motor transportation is provided, due to difficulties of movement for evacuation and provision of rations and water.

VI. The handling of Hospital evacuees in conjunction with Military Police Straggler control presents special problems and requirements.

CONCLUSIONS

I. The Provost Marshal, Civil Affairs Officers, and Counter-Intelligence Corps should coordinate their plans from the initial planning stages straight through to the completion of the operation, keeping each informed of matters pertaining to the functions of the others.

II. There should be a larger allowance of trained Military Police personnel and in event this is not possible, that any personnel attached to existing Military Police organizations be provided early enough to train them for the work which they will perform.

III. To adequately supervise and control all Provost Marshal activities, particularly that of liaison with subordinate units, the Provost Marshal should have a larger staff.

IV. Transport allowances for care and movement of Prisoners of War and personnel handling prisoners be increased.

V. Means of transportation is essential to the proper handling of Prisoners of War, both for supply of rations, of water, and movement of personnel.

VI. While not desirable, released hospital patients can be handled through straggler control posts in emergencies.

RECOMMENDATIONS

I. That Civil Affairs police personnel be assigned to the headquarters at the beginning of the planning phase of any new operations to permit their working with and participating in the preperation of joint police plans for the operation.

II. That the following minimum personnel be provided for any future operation of equivalent size and nature.

1. Prisoner of War Escort Guard Company with each Sub-Task Force and to each Corps and Army headquarters to man the cages and escort Prisoners of War to evacuation points.

2. Each ship which is to be used to evacuate Prisoners of War be provided with one guard platoon as part of the ship's complement, together with supplies and equipment to remain on board at all times for escort of prisoners during evacuation, to obviate use of organic police or combat units for this duty.

3. A Processing Platoon, with one officer in command, of the following personnel to be attached to each Military Police Escort Guard Company:

a. A receiving section of four (4) E/M.
b. An interpreting and rostering section of twenty-four (24) E/M.
c. A record section of six (6) E/M.

4. The Army Headquarters be provided with two tactical Military Police Battalions.

III. That one officer from the Provost Marshal Section be attached to each Sub-Task Force to serve as liaison between the Army Provost Marshal and Sub-Task Force Provost Marshals.

IV. That a minimum of four (4) 2½-ton trucks with trailers and two (2) ¼-ton Recon. trucks be allowed each Military Police Escort Guard Company, and two (2) 2½-ton trucks with trailers for each Prisoner of War Processing Platoon.

V. That there be one army Prisoner of War stockade located centrally within the Army area and convenient to transportation facilities for evacuation of prisoners of war. That any additional cages necessary be located at Army Supply Points and operated only as transfer cages to the Army stockade.

VI. That when released, hospital patients are returned through the medium of Straggler Control Posts, all Medical installations be directed to return such personnel direct to the nearest Straggler Collecting point, together with a list of the personnel delivered. Also that one 2½-ton truck, with driver, be assigned from Army pool to each Collecting point to transport the personnel received direct to their units.

Claude O. Burch
CLAUDE O. BURCH,
Lt. Col., Cav.,
Provost Marshal.

ANNEXES

1 INSTRUCTIONS FOR HANDLING PRISONERS

19 June 1943

SUBJECT: Prisoners of War.

TO : Commanders of All Units, I Armored Corps, Reinf.

1. The attached information is published for the guidance of all members of your command who are concerned with the handling of prisoners of war.

2. During the initial operations, commanders must make definite and positive plans, well in advance, for the collecting, security and maintenance of prisoners of war captured by their units.

3. Although military police organizations will relieve combat units of the custody of prisoners of war as soon as the situation permits, circumstances may prevent this action for an indefinite period.

4. The provisions of the Geneva Convention (FM 27-10), which provides for humane and adequate care of all prisoners, shall be followed.

2 PROCEDURE FOR HANDLING PRISONERS

19 June, 1943

SUBJECT : Procedure for Handling Prisoners of War.

TO : All Unit Commanders, I Armored Corps, Reinforced.

The following extracts from texts referring to prisoners of war and other information available are emphasized for the guidance of those concerned.

1. Prisoners of War.

The following, when captured, shall be treated as prisoners of war.

a. All persons belonging to the armed forces of the enemy, captured in the course of military operations, land, sea or air.
b. Individuals who follow or accompany armed forces, such as correspondents, newspaper reporters, contractors and their employees, shall be entitled to be treated as prisoners of war, provided they are in possession of a certificate from the enemy authorities.
c. Wounded and sick of the enemy forces.

All other captured enemy civilian personnel shall be considered as internees until their classification is determined by proper authority and shall be kept separate from prisoners of war.

2. Procedure After Capture.

a. One of the most important sources of tactical information regarding the enemy is interrogation of prisoners of war. The unit making the capture may interview prisoners briefly.
b. After initial questioning, prisoners will be immediately sent to division prisoner of war collecting points. It shall be the responsibility of the unit making capture to furnish escort guards for this purpose.
c. Until such time as there is a Force enclosure established, evacuation of prisoners of war will be accomplished by the Navy direct from sub-task force collecting points. A receipted roster will be obtained from the naval officer in charge of loading for each group loaded out.

3. Instructions for Handling Prisoners.

a. Prisoners will be disarmed, searched, and ordered to remain silent.
b. A message showing time and place of capture and the unit effecting the capture, will be sent back with the prisoner escort.
c. Prisoners will retain steel helmets, gas masks, identification tags, insignia of rank, decorations, photographs of no military value.
d. Documents will be labeled so as to identify the owner. The documents will be sent back with the prisoner's escort.
e. To prevent bribery by prisoners, money will be taken from them. A receipt will be given. Money will be sent back with other military documents.
f. Prisoners will be segregated into groups: Officers, non-commissioned officers, enlisted men, and civilians. (Note) (German and Italian corporals are enlisted men, not NCO's). There will be further segregation by nationalities.
g. All prisoners will be tagged with W.D.P.M.G. forms #1, at division collecting points when established, which will contain the date, place of capture, and the capturing unit. (Note) All units will check P.M.G. forms #1 in their possession and any forms which have printed in Par. 2 on the back of the tag the words, "No tag-No food" will have such part lined out. This action is directed to prevent reprisals. These tags will remain on each prisoner until he is turned over to a task force enclosure.

4. Nominal Roster.

a. A nominal roster in quadruplicate will be made as quickly as possible at division enclosures and during initial phases will be done at collecting points before turning prisoners over to Navy for evacuation. Disposition will be as follows:

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

1 copy to accompany prisoners group
1 copy to G-1 (Force)
1 copy to Provost Marshal (Force)
1 copy to be retained by division collecting points.

b. These forms will be sent back with prisoner's escort to force stockade.
c. Prisoners will not be held by division or sub-task forces but will be evacuated as rapidly as facilities are available, to force cage.

5. Attention is directed to Sec. III, Circular Number 94, Headquarters NATOUSA, dated 23 May 1943, repeated in Daily Bulletin Number 139, Headquarters I Armored Corps, Reinforced, 28 May 1943.

This circular will be read and fully explained to all members of this command at a regular formation.

6. Souvenir Hunting

Under no circumstances will the troops take articles of any kind from prisoners of war.

7. Assistance By Prisoners

Unwounded prisoners on the way to the rear may be used to assist in carrying wounded prisoners. If chaplains or medical personnel are among the prisoners, their service will be utilized.

8. Wounded Prisoners.

Medical personnel will report the presence of wounded prisoners to interrogating teams. They will deliver documents taken from such prisoners to G-2. Medical personnel will also report statements made by the prisoners if the statements appear to be of military value.

9. Civilian Prisoners.

When civilians are made prisoners, they will be handled in the same manner as other prisoners of war.

10. Prisoners of War are in the power of the hostile power, but not of the individual who captured them.

11. Prisoners of War have the right to have their persons and their honor respected.

6 MILITARY POLICE PLAN

15 June, 1943

MILITARY POLICE PLAN

1. MISSION

The mission of this TASK FORCE will involve a "Theatre of Operation" and a landing over an extended and hostile beach line. Since there are no suitable harbors capable of being used for supplying the Sub-Task Forces, it will be necessary to supply these forces over beach heads for considerable time. The following plan is set up as a guide to Sub-Task Force Provost Marshals in the preparation of their plans of operations.

2. MILITARY POLICE.

a. Military Police duties in the area of each Sub-Task Force will include:
(1) Traffic control at the beach heads and along the lines of communication thereto.
(2) Guarding and disposition of Military Prisoner of War and Civilian internees.
(3) Maintenance of Law and Order in towns and areas occupied by our troops.
(4) Coordination with Civil Affairs personnel in these areas.
(5) Cooperation with the Coun er Intelligence Corps in the apprehension of individuals and facilitation of searches and seizures.
(6) Control of movements of inilviduals including evacuation of civilian population.
(7) The protection of vital installations, including deposits and records of financial and governmental institutions.

b. Personnel.
(1) Assigned Units.

	Officers	EM	Veh

2nd Armd Div MP Plat	4	45	20
82nd Airborne Div MP Plat	2	36	8
* Does not include Med Det of	2	6	0

c. Situation.
In this operation there will be special situations arising in addition to the normal duties and functions covered in B, 1 above for which special measures must be planned.
(1) The landing will be made on a definitely hostile shore. After forcing back of hostile troops, a certain amount of fifth column activity is to be expected requiring constant surveillance and guard.
(2) Sniping will undoubtedly be prevalent, especially in towns where there is an opportunity for cover and hiding. Snipers must be ferreted out and either killed or captured.
(3) The civilian population cannot be expected to be friendly. Therefore, rigid control and regulation of their movement will be required.
(4) During the assault phases at least, no reliance can be placed upon the use of any existing civil law enforcement groups. Even should one or more organizations as a whole be found cooperative a certain period of time will be necessary for reorganization before it can be allowed to function. Even then close supervision and coordination by the Provost Marshals and Civil Affairs Officers will be required.
(5) In the territory covered by the initial operations there are about twenty towns and villages, six of which have a population varying from 20,000 to 40,000.

LICATA	20,641
FEDERAL	31,918
RAGUSA	40,480
VITTORIA	34,769

These towns will present special problems as related to the above situations.

d. Distribution.

The organic Military Police of the Sub-Task Forces will be required by those forces to handle the normal military police functions and duties within these forces such as, tactical traffic control, operation of straggler lines and straggler collecting points, handling of Prisoners of War at Division collecting points and C.P. operation. They cannot therefore be considered as Force troops. This leaves the 50th Military Police Battalion, the 342d and 379th Prisoner of War Escort Guard Companies, and two Prisoner of War Processing Detachments available for assignment to assist Sub-Task Force Commanders in their mission. They have been allotted initially as follows:

(1) Co. "C" 50th Military Police Bn is assigned to the "CENT" Assault.

(2) The 50th Military Police Bn (less companies "A", "B", and "C") and 342nd Military Police Escort Guard Co., and one Prisoner of War processing Detachment is assigned to the "DIME" Assault.

(3) Co "A" 50th Military Police Bn, the 379th Prisoner of War Escort Guard Co, and one Prisoner of War Processing Detachment is assigned to "JOSS" Assault.

(4) Co "B" 50th Military Police Bn, is assigned to "KOOL" Force (Reserve).

These units will be required for beach control, traffic control in the beach areas, at dumps, along the lines of communication, and as Prisoner of War Guards, Prisoner tagging and preparation of nominal rosters. With the taking and occupation of towns in each Sub-Task Force area the problems previously discussed will present themselves. At the present time there are no reserve Military Police units available to meet any situations arising therefrom. It will be necessary for the Sub-Task Force Provost Marshals to meet them with combat troops or to substitute combat troops in some of their other installations to relieve sufficient Military Police for these special duties. Should additional Military Police Units be made available later to Force 343, they will be held as Force 343 reserve to make available to Sub-Task Force Commanders on request for use as aid to the Civil Affairs officers and as security police in captured towns and areas.

3. PRISONERS OF WAR AND CIVILIAN INTERNEES.

Until such time as there is a Force 343 enclosure established on SICILY, evacuation of Prisoners of war and Civilian Internees will be accomplished by the Navy direct from Sub-Task Force beaches to enclosures at BIZERTE and TUNIS in NORTH AFRICA. Prior to movement for evacuation, Sub-Task Force commanders will be responsible for having them properly tagged and that a nominal roster has been prepared in quadruplicate. The Navy escort commander will receipt for the prisoners and Internees received by him at the beach by signature on one copy which will be retained by the Sub-Task Force. One Copy will accompany the Prisoners or Internees and the remaining two copies will be forwarded direct to Commanding General, Force 343.

Until a Prisoner of War enclosure is established on SICILY by Force 343, daily radio reports will be made by each Sub-Task Force Commander to Commanding General, Force 343, giving only total number of prisoners evacuated during day. As soon as conditions permit the Provost Marshal, Force 343, will establish a Prisoner of War and an Internee enclosure on SICILY in the vicinity of GELA with a capacity of approximately 15,000. Sub-Task Force commanders will be notified of the time and date of opening and its exact location. Upon receipt of this notice all Prisoners of War and Internees will be evacuated to the Force 343 enclosure by Sub-Task Forces together with all four copies of the nominal roster. The enclosure commander will receipt by signature for the prisoners or Internees on the file copy and return it to the escort commander for return to the apprehending unit. He will keep one copy for his file and forward the remaining two copies to Commanding General, Force 343. The Provost Marshal Force 343 will assume control of Prisoners of War and Internees at the Force enclosure. He will be responsible for feeding prior to their transfer to NORTH AFRICA. Evacuation will be as rapid as rostering and available shipping space will permit. It is contemplated that Prisoners and Internees will not be held for more than a maximum of three to five days for turn around of ships. Civilian Internees will be kept separately from Prisoners of War. The Commaning Officer of the Force 343 enclosure will segregate and hold, upon request from G-2 prisoners of Internees desired for special interrogation. The estimated daily rate of Prisoners based on G-2 estimates is:

	D to D plus 5	D plus 5 to D plus 15	After D plus 15
Maximum	2500	8000	8000
Minimum	1000	1000	830
Total estimated to D plus 30		30,000	

Medical. Emergency medical treatment for Prisoners of War and Internees at Sub-Task Force Collecting Points will be arranged for by Sub-Task Surgeons. The Surgeon, Force 343 will provide a Medical Detachment at Force 343 enclosure by D plus 10 or upon the opening of the enclosure

Quartermaster. The above mentioned supplies and equipment have been requisitioned.

Engineers. Request has been submitted to Corps of Engineers for material, location and construction of force enclosure to accomodate 15,000 prisoners and Internees on SICILY, to be ready by D plus 10.

Civil Affairs. The Provost Marshal will coordinate closely with the Public Safety Division of the Civil Affairs Section Force 343. Initially and until such time as existing civil police have been reorganized the Provost Marshal 343 and Provost Marshals of Sub-Task Forces will be responsible for the control of Military and Civilian personnel, the maintenance of Law and Order, the control of Traffic, registration and circulation of civilians, and recommendations for the protection of vital installations. In so far as available, Military Police personnel permits, the Provost Marshal Force 343 and Provost Marshals of Sub-Task Forces will furnish detachments of Military Police for assistance of the Public Safety Officers in the enforcement of the laws and regulations of the Military government and in the reorganization and supervision of any existing civilian police forces.

7 AMENDMENT TO MILITARY POLICE PLAN

AMENDMENT NO. 1 TO ANNEX 6. ADM. O. NO. 1. 22 June 1943

MILITARY POLICE PLAN

1. Classified Document above subject this headquarters, dated 15 June 1943, is hereby amended and amplified as follows:

2. The first paragraph of Section III is rescinded and the following is substituted therefor: Until such time as there is a Force 343 Enclosure established on SICILY, evacuation of Prisoners of War and Civilian Internees will be accomplished by Sub-Task Forces to Enclosures in NORTH AFRICA. Escorts will be found from personnel already on SICILY as determined by Sub-Task Force commaniers. Prior to movement for evacuation, Sub-Task Force commaniers will be responsible for having prisoners of war and Internees properly tagged and a nominal roster prepared in quadruplicate. The Commaniing Officer at the Enclosure in NORTH AFRICA to which the prisoners are evacuated will receipt for them on one copy which will be retained by the Sub-Task Force. One copy will accompany the prisoners and the remaining two copies will be forwarded direct to Commanding General, Force 343.

3. Persons suspected of threatening security will be arrested by combat troops or CIC personnel. After preliminary interrogation such persons will be released or turned over to Prisoner of War details for evacuation. Prisoner of War escort personnel will accept for evacuation such civilian prisoners, both male and female, as may be turned over to them by CIC Detachments or combat troops. Civilian prisoners will be segregated from military Prisoners of War and will be evacuated to Division and Corps Prisoner of War cages (Civilian Zing) to the rear. Such prisoners should not be evacuated from SICILY without prior consent of the security staff.

4. Prisoners of War, whether civilian or military, will not normally be evacuated in ships carrying Allied lying wounded, and will not be evacuated on combat loaders. The number of prisoners embarked on any ship will be governed by the sanitary facilities abroad.

8 INSTRUCTIONS FOR PAROLING PRISONERS

27 July 1943

Instructions for the Provost Marshal and Civil Affairs Officer

Subject: Parole of Prisoners of War.

1. Prisoners of War in the custody of units of the Seventh Army may be released on parole subject to the following conditions:

a. Only Italian soldiers (enlisted men), Prisoners of War, whose permanent home and residence is in that part of Sicily now or later occupied by forces of the Seventh Army will be paroled.

b. No prisoner will be forced to accept a release on parole. Enlisted men will submit their applications through a commissioned officer of the Italian Army.

c. Where a prisoner desires a parole to a place other than his permanent home, he will be required to give reasons therefor, satisfacotry to the Provost Marshal.

d. The prisoner will be required to submit his application for parole on the form prescribed (copy enclosed) and the conditions enumerated therein will be carefully explained in the Italian language. The Provost Marshal is responsible that all paroled prisoners fully understand the conditions under which the parole is granted and the penalties for violation thereof.

e. German prisoners will not be paroled.

f. Prisoners needed for intelligence purposes will not be paroled.

g. Military prisoners only will be paroled. Civilian internees will not be released from custody without the prior approval of G-2 in each case, after consultation with civil affairs.

h. Applications will be submitted in triplicate; one copy when approved will be given to parolee, one copy will be transmitted to G-1 and one copy to the Civil Affairs Officer, Headquarters, Seventh Army. The Civil Affairs Officer will immediately transmit his copy to the appropriate Civil Affairs Officer in the vicinity of the parolee's designated residence or destination. The local Civil Affairs Officer may terminate any parole at any time.

i. G-2 agencies will furnish lists of individuals operationally dangerous who will not be paroled. Parolees on such lists will have their paroles immediately canceled and will forthwith be taken into custody.

j. The procedure for reporting is a direct responsibility of the appropriate field Civil Affairs Officer, who, within his means, will cause parolees to report to his office, or will have periodic inspections made of parolees by personnel under his supervision. Where deemed necessary, inspection of parolees may be made through G-2 agencies in cooperation with the local Civil Affairs Officer.

INSTRUCTIONS FOR HANDLING STRAGGLERS

10 August, 1943

INSTRUCTIONS FOR HANDLING STRAGGLERS

1. Personnel on duty at Straggler collecting points will arrange for the return of Military personnel to their units by the first available transportation moving in the direction of the unit.

2. A written order on message forms will be given to the group leader directing his return to his organization without delay, reporting on arrival to the Commanding Officer thereof. A copy will be forwarded thru nearest message center to the unit and a copy retained for file.

3. Stragglers other than hospital evacuees being returned to duty will be marched, where the distance is not prohibitive, under the control of the senior non-commissioned officer or soldier in the group.

a. Seventh Army straggler points are in operation at class 1 dump, PALERMO ASP # 17 West of San Stefano and ASP # 16 NICOSIA.

4. Hospital evacuees will be accorded special consideration. Personnel at collecting points will be responsible for routing recovered wounded via any available transportation to their units. Any unusual delays will be reported promptly to Provost Marshal, Seventh Army, or to the division of which the unit is a part.

5. Medical installations have been instructed to leave discharged patients at the Supply point nearest their installation.

6. During the time personnel from medical installations are being held for transportation to their respective units they will be attached to service unit at the class 1 supply point for rations and administration.

7. Military Police at the PALERMO dump will make all arrangements required to place stragglers on the daily ration train moving from PALERMO to ASP # 17. The Military Police at ASP # 17 will make arrangements to have these men transferred from there to their proper units by ration trucks or other available vehicles.

8. Where the soldiers unit is not located in the forward areas, evacuation from PALERMO will be made by the first available transportaion moving in the direction of the unit.

9. Military Police have authority from the Commanding General to stop any transportation and place hospital released soldiers aboard when the transportation is going to or in the vicinity of the soldiers unit.

REPORT OF THE SIGNAL OFFICER

PLANNING PHASE

The initial directive for the Sicilian Operation, known during the planning phase as Operation "HUSKY", was received about 21 February 1943 when the Signal Officer was directed to report to the Chief Signal Officer, Allied Force Headquarters, Algiers, Algeria, for instructions. Information was there received that an operation was planned to capture the island of Sicily, and that the units involved would be composed of British and American troops.

An estimate was requested as to the types of Signal troops required and the numbers desired. As a basis for this estimate, information was given that the American forces would probably consist of the I Armored Corps, Reinforced, another Corps, probably the VI Corps, later changed to II Corps, the total force consisting of four Infantry Divisions, one Armored Division, and one Airborne Infantry Division, with the necessary attached troops. Based on the above, the following estimate of the types and number of Signal troops was made:

1 - Armored Signal Battalion
2 - Signal Battalions
1 - Construction Battalion
1 - Signal Service Battalion
1 - Signal Repair Company
2 - Signal Depot Companies
1 - Port Signal Service Company
1 - Radio Intelligence Company w/attached personnel of Signal Intelligence Service
1 - Signal Pigeon Company
4 - Signal Companies (Special)
8 - Units of Signal Photo Company

As each staff section of the I Armored Corps, Reinforced, would probably be augmented, with the possibility of the Corps being expanded to an Army Headquarters; personnel requirements of the Signal Section were given as sixteen (16) officers and fifty (50) enlisted men. The approved number of officers was twelve (12). The number of enlisted men was not reduced, but the total, during the planning and execution phases did not exceed twenty-one (21) at any time.

At an early stage in the planning phase, it was recognized that a Base Signal Section would be required to take over from the tactical troops as the operation progressed. A request was submitted for the necessary personnel to include twenty (20) officers and approximately forty (40) enlisted men. Information was received that the greater number of these officers would be ordered to the African Theater from the United States, but that they would probably not be available to assist in the planning phase. Accordingly, a number of officers were attached to the Signal Section for duty with the Base Section to assist the Army Signal Supply Officer in requisitioning and supplying all Signal troops within the force.

Eighteen Signal Corps Officers were detailed to form the 6625th Base Area Group, Provisional, Seventh Army, and arrived at Casablanca on 25 June, 1943, reporting subsequently to the Army Signal Officer at Palermo, Sicily.

As of "D" Day, 10 July 1943, the following troops were assigned to I Armored Corps, Reinforced (Seventh Army) for the Sicilian Operation:

Army Ground Force Signal Troops:

UNIT	O.	W.O.	E.M.

562nd Signal Aircraft Warning Battalion	27	0	560
318th Signal Company, Wing	3	0	88
Total	30	0	648

Communications During the Planning Phase

During the planning and training phase of the operation, speedy communications became a major problem due to the distances between the various headquarters and troop units. Direct telephone lines were set up between Mostaganem, Algiers, Oran, Relizane, and Arzew.

Teletypewriter circuits were set up one each between I Armored Corps, Reinforced (Mostaganem); Allied Force Headquarters (Algiers); Mediterranean Base Section (Oran); II Corps (Relizane), Invasion Training Center (Arzew Area); 1st Engineer Special Brigade (Arzew Area); and 9th Infantry Division (Sidi-Bel-Abbes Area).

Radio links were established between I Armored Corps, Reinforced, and Headquarters Force 141 (15th Army Group), and Fifth Army.

A radio command net was established to include: II Corps, 1st Infantry Division, 3rd Infantry Division, 9th Infantry Division, and the 2nd Armored Division.

A radio administrative net was established to include: I Armored Corps, forward and rear echelons, the 1st Engineer Special Brigade; and the 111th Observation Squadron.

Scheduled motor courier service was established between Mostaganem, Relizane, Oran, Magenta, and Oujda.

At the conclusion of the Tunisian campaign and after units which had participated in that operation had assembled in their respective training areas, under I Armored Corps, Reinforced, the problems of communication became more difficult and involved as the distance between headquarters and units became greatly increased. Units were placed generally in Casablanca, Oujda, Sidi-Bel-Abbes, Oran, Mostaganem, Relizane, Algiers, Constantine, Philippeville, Tebessa, Gafsa, Kairouan, Bizerte, and Tunis. The approximate road and air distances, in miles, involved between these points are:

Mostaganem to Oran - 50 miles (road)
Oran to Oujda - 135 miles (road)
Oran to Magenta - 82 miles (road)
Mostaganem to Relizane - 36 miles (road)
Oran to Casablanca - 450 miles (air)
Oran to Algiers - 235 miles (air)
Algiers to Constantine - 210 miles (air)
Constantine to Bizerte - 195 miles (air)
Bizerte to Tunis - 40 miles (air)
Constantine to Tebessa - 126 miles (road)
Tebessa to Gafsa - 105 miles (road)

The total air line distance between the two extremes of the area, Casablanca to Bizerte, is approximately eleven hundred (1100) miles.

To deliver both tactical and administrative messages, maps, overlays and regulations to these far flung units in a maximum of twenty-four hours presented a communication problem which required all the ingenuity of the members of the Signal Section. This was accomplished by the maximum use of radio telephone, teletypewriter, motor messenger, and an air courier officer service set up jointly by the Adjutant General, I Armored Corps, Reinforced, and the Signal Section. The Adjutant General furnished five officers as air couriers, who, working directly under the Signal Officer, were responsible for the safe delivery of all classified documents between Corps Headquarters and the various units of each S-Task Force. These officers traveled a total of two thousand, two hundred and sixty (2260) miles by air daily, excluding special delivery runs. Planes of the Air Transport Command and the Air Courier Service, U. S. Army Air Corps were used.

Sub-message centers were set up by I Armored Corps, Reinforced, at Constantine, Tebessa, and Bizerte, the personnel for these message centers being drawn from the 51st Signal Battalion. At other points the message center facilities of Allied Force Headquarters, Algiers; Fifth Army, Oujda; Mediterranean Base Section, Oran; and the Atlantic Base Section, Casablanca, were used. The air courier officer would deliver messages and parcels to the sub-message centers, who in turn would deliver by motor messenger to the unit. A total of over seven hundred (700) miles were traveled daily by these motor messengers, making a grand total of approximately three thousand (3000) miles traveled daily in the distribution of correspondence.

Following are the statistics showing the volume of message traffic handled during the planning phase by the message center:

	Radio	Teletypewriter	Administrative	Total
28 April - 1 May	20	140	1000	1160
2 May - 8 May	35	245	1750	2030
9 May - 15 May	50	560	5500	6110
16 May - 22 May	65	875	10200	11140
23 May - 29 May	75	1085	10800	11960
30 May - 5 June	100	1250	12000	13350
6 June - 12 June	115	1400	12800	14315

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

	Radio	Teletypewriter	Administrative	Total
13 June - 25 June	190	1500	13400	15090
26 June - 26 June	160	1610	14000	15750
27 June - 3 July	125	1950	10500	12975
4 July - 9 July	80	925	6500	7505
Grand Total	935	10940	99450	111325
Daily Average	12.8	149.9	1362.3	1525.0

In addition to the above, the message center, I Armored Corps, Reinforced, Rear Echelon, at Oran, handled an average of twenty-five (25) electrical messages, and one thousand (1000) administrative pieces per day, many of these originating at the Forward Echelon.

Training of Signal Troops

In the planning phase of the operation, the training of Signal troops presented quite a problem. Only one Signal Battalion and two Division Signal Companies had had any combat experience. Those units which took no part in the Tunisian Operation had been operating the communication agencies at various headquarters and had had little or no opportunity to carry an adequate Signal training program to a successful conclusion. In many instances units had received new or replacement personnel to the extent of approximately twenty-five percent of their total strength. These men being basics were not trained as Signal specialists and the time available for training was so limited that very little could be accomplished to develop a well trained team.

One special training problem was a change ordered by Allied Force Headquarters in radio procedure. This entailed the training of all radio operators in Link-Sign Procedure. Representatives of the majority of the Signal units were assembled at Mostaganem for this purpose. Two one-day schools, one month apart, were held for this instruction. The training of the various units in Link-Sign Procedure was accomplished by the personnel instructed at the two one-day schools.

It was decided that training in the use and maintenance of the British Speech plus Simplex and Speech plus Duplex equipment was necessary, since it was planned to make this equipment available to American troops. Accordingly, a School was established at the request of the Signal Officer, I Armored Corps, Reinforced, at which members of the 1st Armored Signal Battalion were trained in its use.

Training in the installation, operation, and maintenance of Signal Corps carrier equipment was given at a seven-day school, conducted by the Mediterranean Base Section.

"J" Service (Friendly Intercept)

Orders from Allied Force Headquarters to attach two British Officers who had operated the "J" Service with the British First Army, to Headquarters I Armored Corps, Reinforced, were received on 29 May 1943. The object of this attachment was to regulate the introduction of "J" Service into the American Army and to train personnel in the necessary functions of the service.

To provide a speedy and accurate source of information to G-2 and G-3 Staffs at Army and Corps by interception of friendly forward nets.

To monitor said nets with a view to a check on breaches of security. (Any such breaches to be dealt with by Divisions).

Arrangements were made for the interception on board headquarters ships. Radio Intelligence Platoons of the 1st and 3rd Divisions had been warned that they would be used for "J" intercept, and it had been suggested that a similar course be adopted with other infantry divisions.

Arrangements were made for the assembly and distribution of codes and Signal Operations Instructions. The staffs of the sections concerned were informed as to the advantages and limitations of "J" Service. An attempt was made to coordinate I Armored Corps, Reinforced, "J" Service, and the Eighth Army "J" Service.

"J" Service was placed under control of G-2, I Armored Corps, Reinforced. The various Radio Intelligence Platoons were controlled by G-2 of Divisions. It is considered that a more satisfactory arrangement would be to control all "J" Platoons from Army Headquarters. The following is a suggested organization:

Army Headquarters Control Officer and assistant; one radio transmitter, three operators, and two clerks. Three "J" Platoons consisting of two officers (or one officer and an assistant), four AM receivers, four FM receivers, and sufficient transport to carry personnel, baggage, and rations. Each unit to be self contained for a short period, should it be operating away from its headquarters.

Signal Supply During the Planning Phase

The Signal Supply personnel for the Operation "HUSKY" were designated during April and became an operating team about 1 May 1943, although most of the personnel did not report until 1 June 1943, at Rear Headquarters, located at Oran, Algeria.

Initial estimates of the Signal requirements were made and requisitions submitted for not only the equipment necessary to bring all units up to T/BA allowances, but also for the first twenty-one (21) day maintenance for this operation. Considerable special equipment was needed for Operation "HUSKY", and it became necessary to improvise and purchase from any source available the particular items needed. One particular such installation was the radio set, SCR-299, mounted within a moisture proofed housing which in turn was installed on the two-and-one-half ton amphibious truck.

Twelve such installations were made and issued to the various Sub-Task Forces. Their satisfactory use during and after the landing phase has justified the time and effort spent on them. They are highly recommended as essential items of equipment for any future amphibious operation.

During the planning phase, a total of twenty-nine (29) requisitions were prepared to be filled in the United States and sixty-three (63) requisitions to be processed in the North African theater. These requisitions represented approximately nineteen thousand, two hundred and twenty (19,220) tons of Signal equipment which it was necessary to receive, record, and issue, or prepare for over-water transportation to Sicily to form the initial stock for the Signal Supply Depot when established on the island. Of particular interest, and a constant source of trouble, was the procurement of waterproof bags, which were supplied to units for wrapping Signal items, where the probability of damage from salt water might be encountered. Many items required special packing to prevent damage when being handled over the beaches. The fact that only a small percentage of the equipment actually handled was damaged is proof of the excellent job performed by the Signal Supply Forces.

Four Sub-Task Forces were to be supplied, three to go ashore simultaneously on "D" Day, and one to be held in reserve. Available shipping allotted to each Sub-Task Force and place of mounting, as well as turnaround of vessels dictated the number of days maintenance to be carried by each group. Phase requisitions for Class II and Class IV supplies were prepared and submitted to S.O.S. as follows:

For CENT Force - 21 Day maintenance combat loaded in U.S.
For DIME Force - 7 Day maintenance LST & LCT loaded in North Africa with two more 7 day maintenance shipments to arrive on subsequent follow-up convoys.
For JOSS Force - Same arrangement as for DIME Force.
For KOOL Force - 21 day maintenance combat loaded in North Africa.

Other special phased requisitions were prepared for such units as Special Ranger and Airborne Units and were processed. To facilitate the handling and caring for these supplies, S & I Sections of the 206th Signal Depot Company were attached, one each to JOSS, DIME and CENT Forces. This was a very satisfactory arrangement. All supplies, after first 21 day maintenance were to arrive from the U.S. on schedule convoys. 15 days added reserve was packed and held in North Africa to take care of any unforeseen emergencies.

Headquarters Ships

Headquarters ships were provided for Seventh Army, II Corps and 45th Infantry Division combined, and 1st and 3rd Divisions. In addition, each Regimental Combat Team improvised its own headquarters upon the ship transporting it. Each headquarters divided its personnel and equipment so as to provide an alternate command post in the event its headquarters ship was sunk. Of the above ships, only one was completely constructed as a headquarters ship; the others were improvised within the African theater.

The number of radio channels which can be permitted on any headquarters ship due to space limitations and interference due to proximity of sets is rather small. Each of the three services, Army, Navy, and Air Corps specified the minimum number of channels which would perform their required mission while afloat and during the landing phase. The following number of channels were used by each of the headquarters while afloat:

Channels

	Army		Navy		Air Corps	
	Trans.	Rec.	Trans.	Rec.	Trans.	Rec.
Seventh Army	5	6	10	13	6	7
II Corps	4	5	11	13	6	8
1st Division	6	12	11	13	3	4
3rd Division	6	12	10	12	3	4
45th Division	4	10	See II Corps		See II Corps	
Each Regimental Hq.	4	4	--	--	-	-

The channels listed above were as follows:

Seventh Army - Command Net (A-1)
Reporting Net (A-3)
Airborne Units Net
Fifteenth Army Group Link (F-1)
Monitor Receiver
FM Voice Channel

II Corps - Command Net (C-1)
Reporting Net (A-3)
Airborne Units Net
Seventh Army Link (A-1)
Monitor Receiver

1st Division - Command Net
Ship-Shore Net
II Corps Command Net (C-1)
Reporting Net (A-3)
Airborne Units Net
Monitor Receivers
FM Voice Channel

3rd Division - Command Net
Ship-Shore Net
Seventh Army Command Net (A-1)
Reporting Net (A-3)
Airborne Units Net
Monitor Receivers
FM Voice Channel

45th Division - Command Net
Ship - Shore Net
II Corps Command Net (C-1) (After landing)
Reporting Net (A-3)
Monitor Receivers
FM Voice Channels

Each Regimental Headquarters including attached Shore Engineer Unit - AM Command Net (Inf)
FM Command Net (Inf)
AM Shore Battalion Net (Engr)
FM Shore Battalion Net (Engr)

As far as possible the actual radio sets used were Naval equivalents for normal sets used by the Army, the reason for this being that Naval radio sets are manufactured with the view of withstanding a salty atmosphere. As a result of these arrangements, all three services had individual channels after radio silence was lifted which could be devoted to their own missions. It had been found in Operation "TORCH" that Naval channels were entirely inadequate to carry Army and Air Corps traffic. The number of radio channels to be provided for each service depends upon the mission of that service and the number of subordinate units in the Task Force. Furthermore, the channels for the three services are entirely separate, and must be kept so for efficient and prompt operation. In the Sicilian Operation, particularly in the over-water and landing phase, it was found that too much traffic was being handled for the number of channels available. This was caused by a tremendous number of administrative messages being forced upon these stations from higher headquarters at a time when there should have been nothing but tactical traffic. All messages to be transmitted by any headquarters must be carefully edited by the Chief of Staff or his Deputy. Similarly, all incoming messages should be delivered to the same officer to provide for proper and speedy distribution within the headquarters.

Special radio channels were provided to Naval line ships and to Naval fire support parties which accompanied the various Sub-Task Forces ashore. This procedure had been previously tested, and as in a former operation, again worked to perfection. The radio sets used by these parties must be of sufficient power and range to cover the distances required and must be light enough to be readily carried while ashore. In the Sicilian Operation these sets were SCR-193's, mounted in one-quarter ton trucks. They were carried by Artillery personnel from the various units accompanied by Naval Liaison Officers who directed the fire of Naval vessels.

As previously stated, all headquarters ships, except the U.S.S. ANCON, carrying II Corps and the 45th Infantry Division Headquarters, were improvised. Thanks to the cooperation of the Navy and Air Corps, communication facilities of all ships worked well. However, the headquarters ships were badly cramped for space. There was insufficient room for radio operators, for message center and code clerks, and for the war room. This space could not be increased by improvisation, due to the structure of the ships themselves. Because of this, there were radio stations scattered over widely separated spaces. This caused difficulty of control, reduced the number of channels which could be provided and in general slowed up the clearing of radio messages.

The radio control room itself was, besides being too small, almost completely without ventilation. The temperature during this period was extremely high. This caused much unnecessary hardships on the radio operators. The message center room was shared by all three services, and was so congested that the Message Center Officer was unable to supervise its operation without interfering with the men at work.

It was necessary to have several separate code rooms. There was a U. S. Navy code room, a British Navy code room, a U.S. Army code room, a British cryptographic section requiring separate space, and an Air Corps set up. The space provided was scarcely adequate to get the men and their machines into place.

The fact that very few garbled messages were reported was due to the high grade personnel only. The war room on the MONROVIA was so constructed that messengers had difficulty in delivering their messages. It is strongly recommended

SECRET

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

that the U.S. provide specially constructed and designed headquarters ships for any future amphibious operations. Improvisation of ships can be made to work, but will never be satisfactory.

Signal Communications Plan

The culmination of the planning phase for the Signal Section was the issuance on 21 June 1943 of the Signal Communication Plan, which is attached as Annex No. 10 to Field Order No. 1, reproduced elsewhere in the main report of operations.

OVER-WATER AND LANDING PHASE

During the time the force was at sea, radio silence was maintained by all services. Communications between ships was by means of blinkers, used only during daylight hours. All radio nets were constantly monitored with the dual purpose of maintaining absolute radio silence within the force and to receive any broadcast sent from shore stations in the nets.

"H" Hour, "D" Day was to be 0245B (0045Z) 10 July 1943. Radio silence was broken at 0305B. During the period at sea, the time of lifting radio silence was controlled by the naval commander.

When silence was lifted, all radio nets were quickly established and communications remained excellent during this phase of the operation. Some delay was occasioned in the clearing of important messages, due to an excessive amount of administrative traffic being handled. Much of this traffic was overclassified. This difficulty was soon placed under control. It was directed that all messages to be transmitted over Army channels be approved by the Chief of Staff before being sent. In this way outgoing administrative traffic was eliminated. It was found impossible to eliminate such incoming traffic. The conclusion thus reached and which was maintained thereafter, was that only tactical traffic would be handled by radio during this phase. In future operations arrangements must be made that at all headquarters of the force, radio traffic must be limited to tactical needs only, or have separate nets established for tactical and administrative needs.

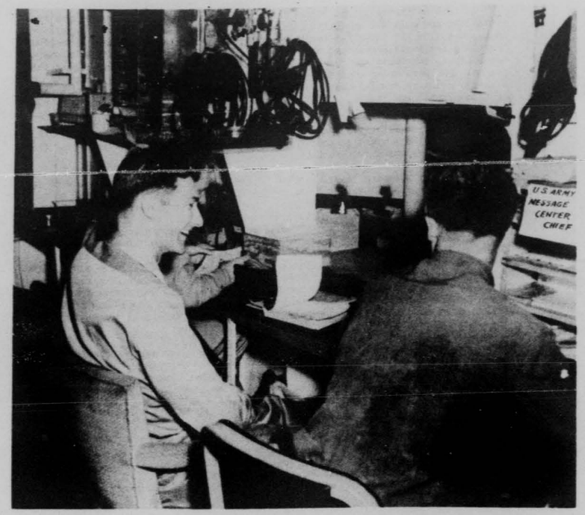
A resume of traffic handled by the radio sets of Seventh Army during the period afloat show:

Day	Date	Messages	Groups*
"D"	10 July 1943	104	6966
D + 1	11 July 1943	115	8836
D + 2	12 July 1943	158	14056

*The groups figure does not show the total groups actually sent, as many of the messages were to multiple addressees, which required transmission over several nets. The total groups transmitted was approximately double this figure.

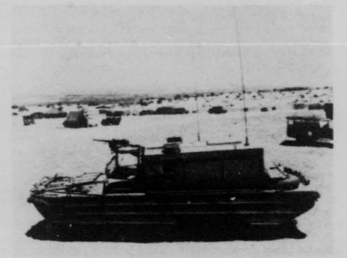
Frequency modulated sets provided to the divisions and lower units worked very successfully during the landing phase.

Radio sets, SCR-299, mounted in two-and-one-half ton amphibious trucks, were used successfully in the operation. They provided the most reliable high powered radio communications during the landing phase. They were able to operate either on land or on water.



The story of the part played by the Signal Corps in the Sicilian Operation can best be divided into the phases between movements of the Army Command Post. These periods are as follows:

On board the U.S.S. MONROVIA -	10/12 July 1943
Gela	12/21 July 1943
Agrigento	21/25 July 1943
Palermo	25 July 6/August 1943
San Stefano di Camastra	6/15 August 1943
Naso	15/20 August 1943



Period 10/12 July 1943, U.S.S. MONROVIA

During this period the command post was established on board the U.S.S. MONROVIA. Due to the nature of the operations, radio provided the only means of communication. Radio silence was lifted at 0305B, 10 July 1943. In spite of the crowded conditions aboard ship, and the small number of radio operators who could be carried, necessitating each man to work long hours, traffic was cleared with an efficiency and speed which left little to be desired.

One variance from established command and communications channels was noted during the landing phase. The action became so rapid in the initial stage that it was necessary to operate an Army radio set directly in the Corps-Division net to obtain early information on the situation. This was done and proved of inestimable value to the Army Commander.

Seventh Army Message Center Aboard U.S.S. Monrovia.

Waterproofed Mounting of Radio Set SCR-299
Mounted in 2½ Ton Amphibious Truck.

Radio Set SCR-299 in 2½ ton Amphibious truck.

Building of House and all Installation Work

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

Period 12/21 July 1943, Gela

During this period the Army headquarters was set up at Gela. The 1st Armored Signal Battalion received orders to establish the Signal agencies and be ready to open the command post at 1600B, 12 July 1943. It had been decided that the command post would be divided into a tactical headquarters and a rear echelon, containing all administrative sections. This necessitated a set-up of two command post installations. The Signal Officer and his staff were placed at the rear echelon, causing him to be somewhat out of touch with the tactical developments. Frequently this caused some delay in taking effective action.

As soon as the roads to Licata and Ragusa were cleared of enemy troops, work was started on rehabilitation of two open wire circuits each way. Considerable damage was done to all overhead wires in this area by the retreating enemy. Improvements in these lines were then attempted. These improvements included the soldering of splices, transposing circuits to avoid cross talk, replacing insulators and poles, retying and properly sagging the lines.

Considerable trouble was encountered from enemy sabotage to these lines. Before the end of the campaign a number of suspected enemy saboteurs had been taken into custody. The trouble was effectively reduced by the arrest of every person identified as having knowledge of wire construction, operation, or maintenance in the general area around Licata and Canicatti.

Little difficulty was experienced with radio transmission or reception during these dates, the principal causes of delays being that all messages were of such length, that considerable time was used in encoding, transmitting, and decoding, and that a sufficient number of radios had not been landed to care for the voluminous traffic. One additional cause was the fact that many messages were overclassified, causing a build-up of traffic at peak hours.

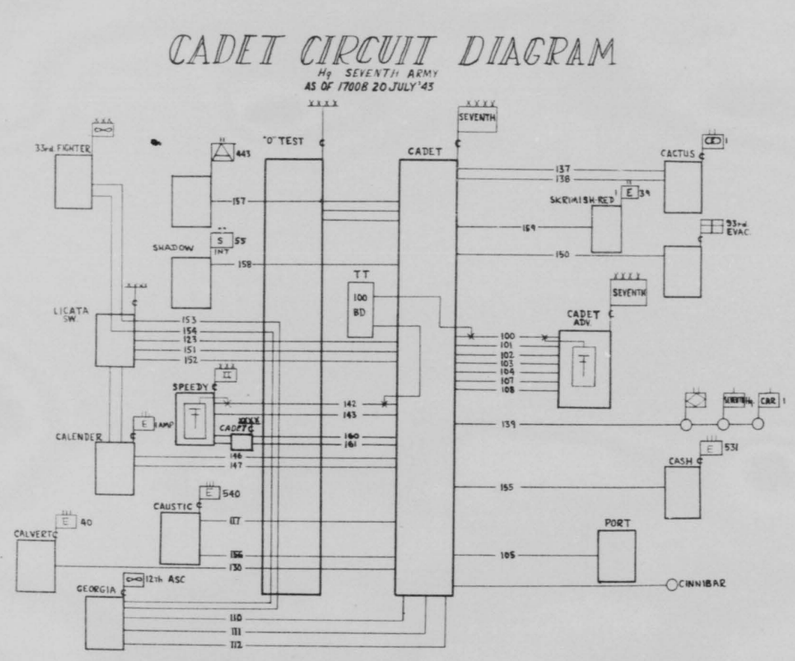
Early during this phase it was noted that the operation would continue along two axes, one north towards Caltanissetta, and the other generally northwest to Agrigento - Castelvetrano, thence northward to Palermo, which axis necessitated the formation of a Provisional Corps to be composed of the 3rd Infantry Division and the 82nd Airborne Division. The 2nd Armored Division was later placed under this Corps. An acting Corps Signal Officer was detailed with message center and radio personnel and equipment, drawn from the 1st Armored Signal Battalion. It was planned that only motor messenger and radio communications with Army and subordinate units would be used, due to the lack of sufficient Signal wire personnel to reconstruct and maintain open wire routes.

Period 21/25 July 1943, Agrigento

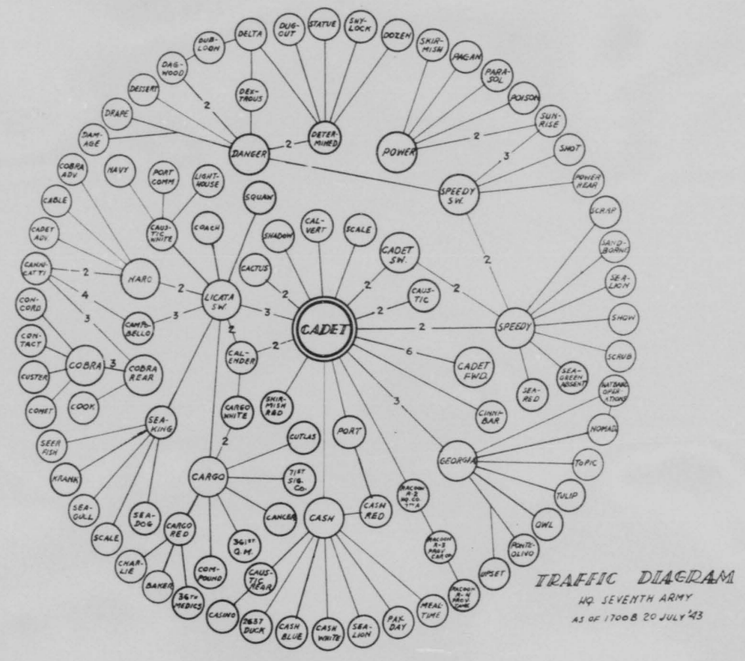
The advance of the Seventh Army had progressed so rapidly that by 18 July, a move of the Command Post was necessary. The city of Agrigento was chosen as the site, and communication facilities installed, the command post opening officially at 1200B, 21 July 1943.

Wire communications were extended northward and efforts were redoubled to keep pace with the rapid advance of II Corps, this being accomplished by the various wire crews working from dawn till well into the night. The speed of the advance did not permit the thorough rehabilitation of open wire lines that should have been made. The use of carrier equipment was impractical due to the unbalance existing on all circuits, many such circuits being composed of different gauges of wire as well as having copper and iron wire interspersed. In many instances it was found that it was easier and quicker to replace the existing wire plant with new wire. Very little damage was done to the pole plant in this area. Sabotage continued to be a source of much trouble. As an example, on the Syrial-h cable between Palma and Agrigento during one twenty-four hour period, this cable was burned into three times and hacked with an axe five times. Switching centrals were installed at Gela, Licata, Naro, Canicatti, Campobello and Palma to control the wire net and give greater flexibility to the system. These installations consisted of one or more BD-72 switchboards with three operators. Radio continued to be the principal agency of communication to Provisional Corps, and worked satisfactorily.

By 24 July two circuits of open wire lines had been extended to Villafrati, twenty-two miles southeast of Palermo, to the general vicinity of Vallelunga Frateneno, thirty-three miles northwest to Caltanissetta, and to Alimena, twenty-one miles east of Vallelunga Frateneno.



In this phase radio reception was extremely difficult due to the poor ground conductivity in the area and that the distances between command posts were, in a number of cases, beyond the range of the lower powered sets.



Teletypewriter service was established to II Corps and Gela, but worked only intermittently due to poor grounds, strong leakage to ground and numerous cases of sabotage on the lines.

Period from 25 July to 6 August 1943: (Palermo)

On 22 July the city of Palermo surrendered to units of the Provisional Corps. Corps Headquarters were established in the Royal Palace (Palazzo Reale) in Palermo. Plans were made to open Seventh Army Headquarters in that city at 1200B on 25 July. It was decided to move both the tactical and administrative headquarters. A dual installation of signal agencies was made; the Advance at the Royal Palace and the Main Headquarters located in the Post Office Building.

SECRET

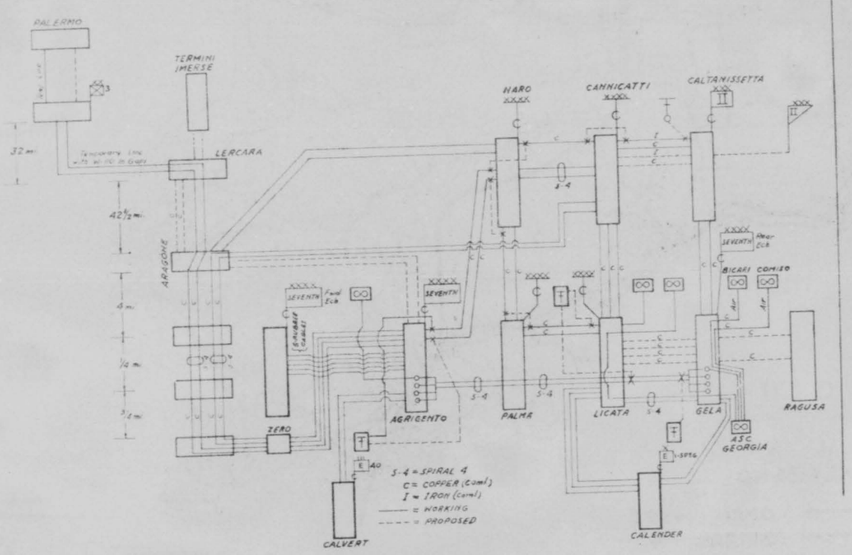
In Sicily it was found that there were two communication systems. The Poste Telefoni and Telegraphi, which was state owned and operated, and which furnished all telegraph and long distance telephone service to Italy and foreign countries. The Societa Esercizi Telefonici, known as S.E.T., is a privately owned local and inter-island telephone company operating in the western half of Sicily. This company furnishes the local telephone service and a limited amount of long distance within the island. The Poste Telefoni and Telegraphi equipment was located in the Palermo Post Office, and was not damaged. This office was placed under military guard and no one permitted to enter, as all the long distance equipment to Italy was installed in this building. Use was made of the local dial telephone system insofar as practical. The personnel of S.E.T. were assembled at the telephone office and seemed willing and anxious to cooperate with the Army Signal personnel to restore the local telephone plant. Considerable damage had been done by a direct bomb hit on the Telephone Building, which destroyed all of the long distance central office equipment, but only slightly damaged the local dial equipment.



One signal officer and five enlisted men experienced in maintenance of central office equipment were placed in charge of the S.E.T. dial office. Civilian telephone service was discontinued with the exception of those lines approved by the Allied Military Government of Occupied Territory (AMGOT). The equipment was found to be dirty and dusty from the bombings and badly in need of maintenance. Walls and windows of the building were repaired by signal troops. All equipment was cleaned and adjusted by signal personnel and civilian employees. There were four telephone trunk lines connecting the tactical and main headquarters, with a total of one hundred and nine dial lines in operation at this time. There were twenty-six common battery trunks and eighteen locals operated from the main switchboard. Central office and local installations were made for the Navy, Harbor, Anti-aircraft office and local installations were made for the Navy, Harbor, Anti-aircraft Defense and other units in the Palermo area. The use of the dial system as the principal exchange of army headquarters was found to be unsatisfactory and a three position TC-1 Switchboard was installed.

Considerable destruction, due to bombings, of underground cables and open wire circuits was encountered within the city of Palermo. The rehabilitation of the open wire circuits, which inside the city were mostly placed over the tops of three and four story buildings, presented quite a problem, until, it was solved by the use of the local fire department's extension ladder. (See accompanying photographs) Pending the completion of the rehabilitation of the open wire lead in the city, a ten-pair, rubber covered cable was laid from the main switchboard to the outskirts of Palermo, at which point it was connected to the open wire. During this phase the remainder of the 51st Signal Battalion arrived at Palermo, adding one additional Construction Company, and a Headquarters Company.

On 26 July, the rehabilitation of the open wire routes along the north coast, towards Termini Imerese and Cefalu, were started and was pushed with all possible speed to establish wire communications to II Corps, whose axis had been changed from Gela - Palermo to Palermo - Messina. Switching centrals were established at Termini and later at Cefalu. Initially, four circuits were reconstructed from Palermo to Cefalu with two circuits then carried to San Stefano di Camastra with the signal troops working immediately behind the combat troops. From Palermo to Messina the signal troops were confronted with a new and more serious handicap in the form of hundreds of mines. Placed along pole lines and along the railroad right of way between ties, where it was necessary to work as most of the wire leads followed the railroad tracks. Special signal men had been trained in the use of mine detectors and rendered yeoman's service in finding, and in many instances removing these deadly weapons. The low casualty rate of signal personnel from mines was due to the excellent work performed by these men. Considerable difficulty was experienced along the northern coast due to sabotage and subordinate units cutting in on the lines. As the circuits became longer, more care had to be exercised in re-transposing, resagging, and in the soldering of all splices. Several crews of two men each were assigned to the all important job of soldering all splices in the line.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

Period from 6 August to 15 August 1943, San Stefano di Camastra

By 6 August the Germans and Italians had been driven eastward to a line running generally north and south through San Agata - San Fratello. A location near San Stefano di Camastra was chosen for the next Army Headquarters. It was decided that the administrative headquarters would remain in Palermo. Tactical headquarters opened at San Stefano at 1930B, 6 August 1943.

During this and the preceding phases the 1st Armored Signal Battalion furnished all radio links for both the tactical and administrative headquarters, Seventh Army, and Provisional Corps. In addition to the above, two SCR-299 sets were furnished for a liaison net between Seventh and Eighth Armies and were located at the command post of the latter. One British radio detachment located at Headquarters Seventh Army operated the 15th Army Group - Seventh Army net. On July 31 and July 30, the 229th Signal Operations Company took over the operations of the radio sets at Sels and Agrigento, respectively. The 1st Armored Signal Battalion continued to operate all radios at Provisional Corps until relieved by the 51st Signal Battalion on August 15th. At this time seven sets were in operation at the tactical headquarters, and eight in operation at the administrative headquarters.

Switchboard installations at the tactical headquarters consisted of two TC-4 switchboards, with thirty-nine local telephones and fourteen trunk lines. The zero board, where all testing of lines was performed, was located about one-half mile from the main switchboard and was connected by two ten pair rubber covered cables. Switching centrals were placed at Termini Imerese, Cefalu, and Petralia.

Teletypewriter service was established to the Administrative headquarters at Palermo, II Corps, 3rd Division, and 45th Division.

Wire construction in this phase continued along the coastal route, practically all being along the railroad tracks, with lateral open wire lines being rehabilitated or by placing Spiral-4 cable or long range field wire to the successive locations of II Corps Command Posts. This method of construction provided greater flexibility of circuits as it furnished alternate means of wire communications for both telephone and teletypewriter traffic. At this time the 1st Armored Signal Battalion succeeded in converting several bicycle type railroad hand-cars into motor driven hand-cars to be used along the railroad right of way to rehabilitate the telephone circuits. These cars greatly speeded the construction and maintenance of wire lines. Due to the peculiar situation as to the location of Command Posts, Army Headquarters, 3rd and 45th Divisions being located along the northern or coastal axis, and II Corps, the 1st and 9th Divisions along the southern axis about twenty-five miles south of the coastal road, both running in a parallel direction east and west, direct lines were constructed to the 3rd and 45th Divisions so that the Army Commander could get early information of the progress of the operation from liaison officers at these divisions. Wire communications to the rear were being improved until there were eight circuits between Palermo, Termini Switch, and Cefalu Switch, and six circuits between Cefalu Switch and San Stefano.

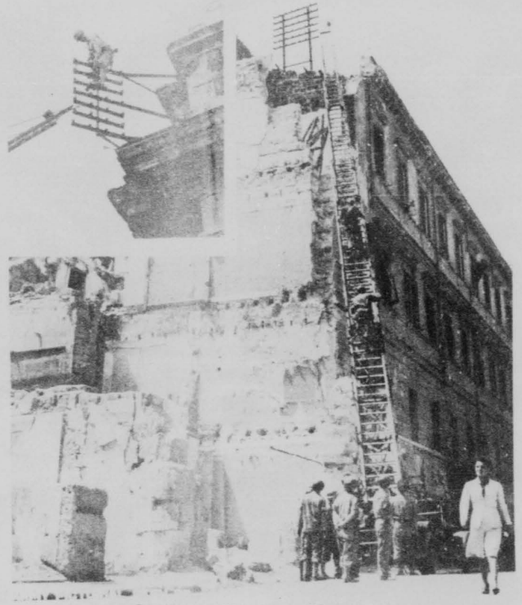
Scheduled and special motor messenger service was established to II Corps, located two miles east of Petralia, Provisional Corps at Palermo, 3rd Infantry Division at Mistilneri, 2nd Armored Division at Monreale, 82nd Airborne Division at Trapani, and with Agrigento.

Special Air Messenger service was used to II Corps, 82nd Airborne Division and to Agrigento, using Cub planes of the Artillery Section for a period of three days, after which the planes could no longer be spared.

Radio control was initially established within the tactical Command Post in the Royal Palace but was later moved to the transmitter area when the daytime noise level adjacent to the Command Post became so high as to seriously affect communications. The dispatch of messages between the message center and radio control was handled by teletype and motor messenger. Thirteen radio links were placed in operation at this time.

During the occupation of Palermo, a German ultra-short-wave radio-telephone set was found on top of a mountain overlooking the city. This set worked in the 500 - 600 megacycle band and was extremely directional. This equipment appeared to be only slightly damaged. Since it was learned that the Signal Intelligence Service was anxious to secure such a set, orders were issued to dismantle and send it to higher headquarters. This set was shipped from Palermo on or about 8 August 1943.

Period from 15 August to 20 August 1943, Vicinity of Naso



During this and the previous phase, the rapid advance of Seventh Army was assisted by two landings made behind the German lines along the coast, in the vicinity of Torremnova and Brolo. During these landings one SCR-299 radio set, mounted in a 2 1/2-ton amphibious truck, was furnished the 3rd Division and was used very successfully. The front line had moved forward and it was again necessary to move the Army Command Post. A reconnaissance for location was made and a site selected five miles off the wire axis in the vicinity of Naso. The Command Post opened at 1200B, on 15 August 1943.

The same radio nets were set up as at San Stefano with one addition. On 17 August one SCR-193 radio, mounted in a scout car, was sent to the 3rd Division to provide a direct link back to Army Headquarters. Wire communications were re-established with the 3rd Division at Cefalu Marea, approximately thirteen miles from Messina on 17 August. II Corps Command Post had moved to a point north of Cesaro. No open wire circuits existed on the road running south from San Agata to Cesaro, so two spiral-4 cables were laid to provide Army - Corps communications.

The tactical headquarters of Seventh Army closed at Naso, and opened at the Royal Palace in Palermo already, on August 1943.

Total:

Number of Days of Operation	40
Total Messages (Incoming and Outgoing)	8,309
Average Number of Messages per day	198
Groups Handled (See Note*)	885,342
Average number of groups per message	107

Note*: The groups figure does not show the total groups actually sent, as many of the messages were to multiple addresses, which required transmission over several nets. The total groups transmitted was approximately double this figure.

REPORT OF ACTIVITIES OF SIGNAL AGENCIES

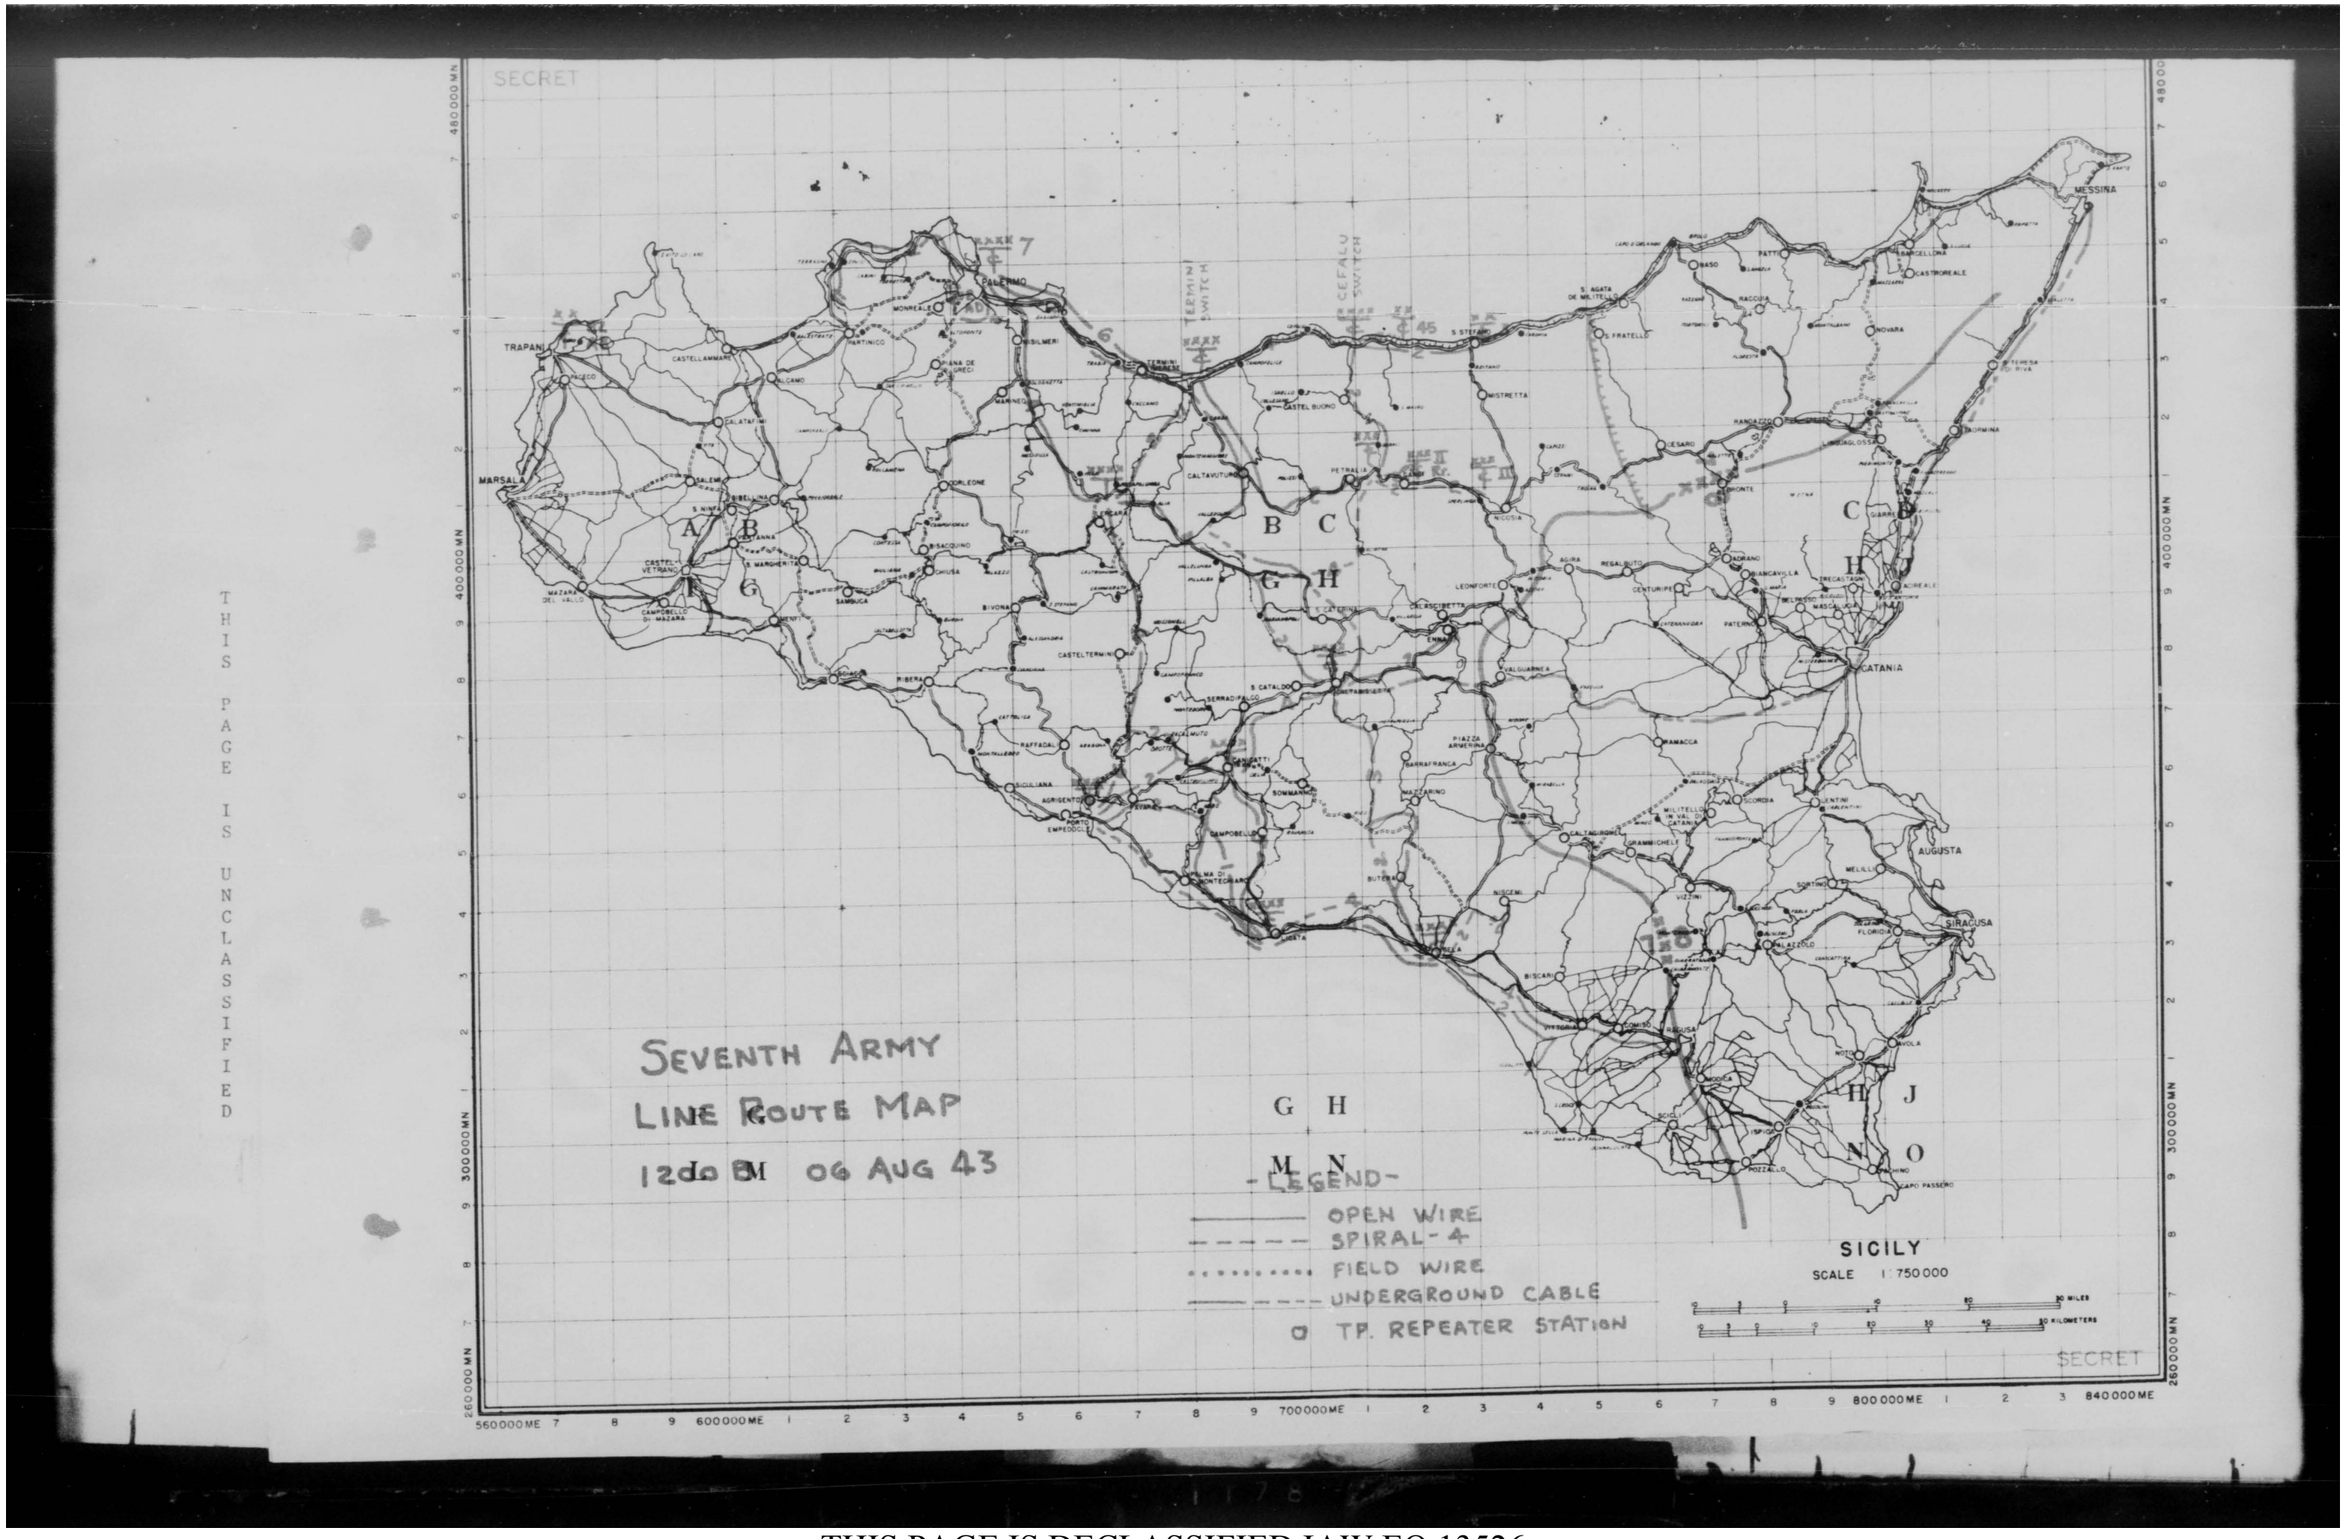
Message Center:

Pre-assault phase.

A complete Army Message Center was established by the 1st Armored Signal Battalion on board the Army Headquarters Ship "U.S.S. MONTICELLO" at 0001B, 1 July 1943 (D-4) and continued to operate until 1600B, 11 July 1943, (D plus 2), at which time the Command Post opened at Sele, Sicily.

Personnel for a second message center, furnished by the 1st Armored Signal Battalion, were loaded on LST 325 on 24 June 1943. The mission of this group was to set up a signal center ashore in Sicily before the Army Command Post aboard the U.S.S. MONTICELLO closed.

During the period prior to "D" Day it was necessary to continue the operation of the Army Signal Centers at Mostaganem and Oran. The 229th Signal Operations Company relieved the 1st Armored Signal Battalion at these places on 29 June 1943.



Upon receipt of orders to close the signal center at Mostaganem on 30 June 1943, a small message center operated by the 229th Signal Operations Company was set up to serve the headquarters group at Algiers and was opened on 30 June 1943. The message center for Army Rear at Oran continued to operate until 16 July 1943, to serve parts of staff sections left at that point. On 6 July 1943 a signal center opened at Bizerte, Tunisia, manned by the 51st Signal Battalion, and was designated as Seventh Army Rear. At this time the Tactical Headquarters officially opened aboard the USS MONTICELLO.

Due to the crowded conditions aboard the USS MONROVIA, space was provided for two SIGABA and three M-209 operators but the unusually heavy traffic in the M-209 cipher device required two extra code clerks. The two SIGABA machines were found to be inadequate due to the large number of high priority secret messages, therefore the probability of error was greatly increased due to not being able to use the SIGABA in tandem and insufficient time to check the accuracy of coded messages. It was essential due to the extremely urgent nature of the traffic handled that messages not only be cleared but that they be cleared immediately without a back-log of messages. This was impossible due to the fact that five or six urgent messages came into the code room at one time. It is felt that a minimum of four SIGABA machines were required.

Assault Phase.

Message center operations aboard the USS MONROVIA began on "D" Day when radio silence was lifted and by 2359B a total of 104 messages and 6853 code groups had been handled. Traffic was progressively higher on the two succeeding days afloat amounting to 135 messages and 9994 groups on D plus 1 and 174 messages and 14742 groups on D plus 2.

The message center personnel on board LST 325 was landed on 11 July 1943 (D plus 1) and was prepared for operation when the Command Post was established ashore.

As the operation progressed inland and the Army Command Post was opened at Palermo, it was necessary to place sub-message centers in central locations to handle the administrative traffic. The 229th Signal Operations Company took over the operation of the message centers at Gela and Agrigento, thus assuring complete administrative coverage of all rear areas.

When the tactical headquarters was established, the 51st Signal Battalion relieved the personnel of the 1st Armored Signal Battalion at the administrative headquarters in Palermo and continued to operate this Echelon until the close of the operation.

Pigeons

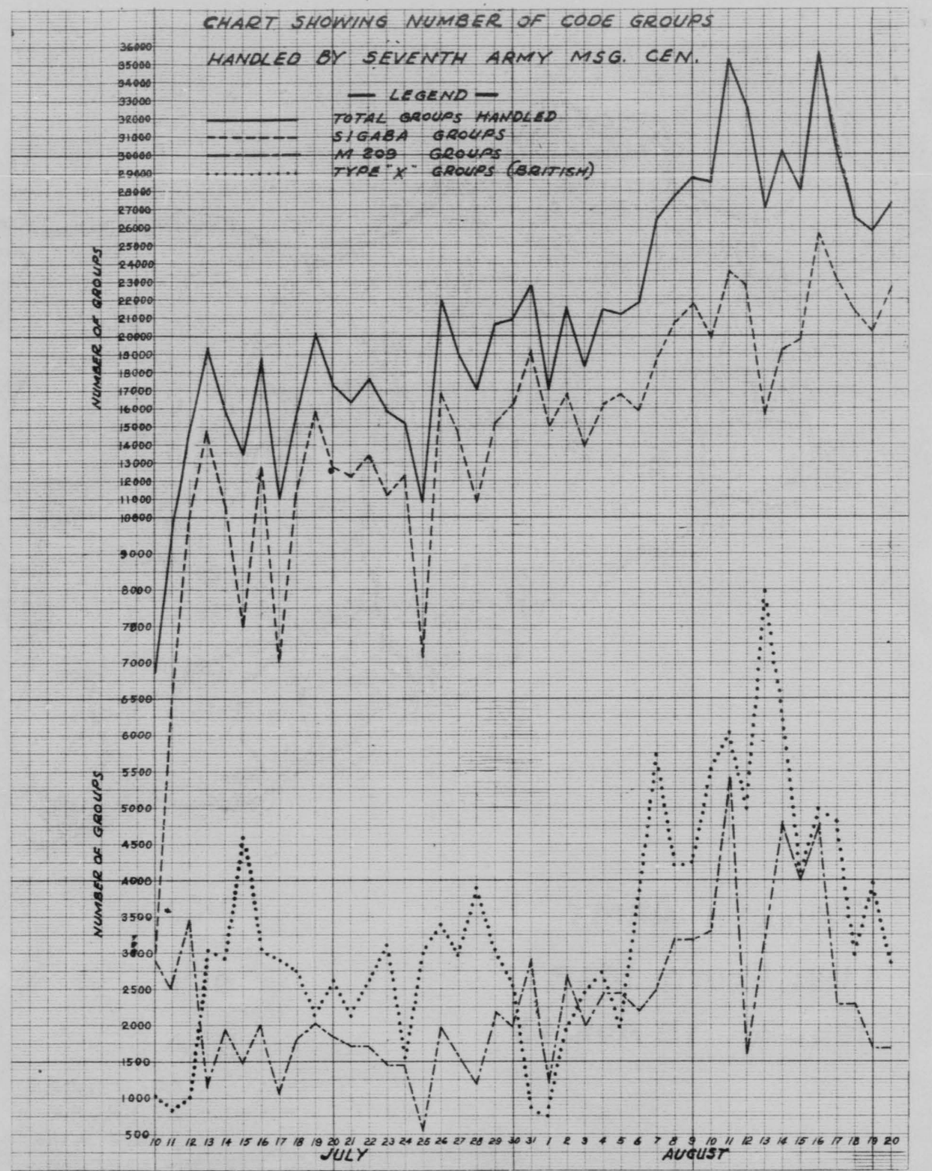
Due to the lack of transportation, pigeons were not used at any time during the Sicilian operation. Had they been available it was felt that this agency of Signal Communications could have been used to great advantage as the mountainous terrain and the rapid advance of the troops, made the use of pigeons an ideal means of communication. In many instances units were sent into the mountains to clear enemy points of resistance and to flank positions held. Baskets of pigeons could have been carried by these troops and used advantageously. Many instances occurred where these units were out of communication with their perent organization, for periods of twenty-four hours due to the restriction of radio silence; when surprise was necessary to these operations. Pigeons in these cases would have warranted the space necessary for their shipment to Sicily.

Visual Communications

No instances of the use of visual communications were reported to the Army Signal Officer. However the use of yellow smoke to indicate the positions of front line troops to friendly aircraft was habitual.

Signal Intelligence Activities

Planning



The part which Signal Intelligence "Y" (enemy intercept) activity was to play in Operation "HUSKY" was determined and planned by higher headquarters.

At the start it was planned to have the 128th Signal Radio Intelligence company divided into three detachments each with a detachment of 849th Signal Intelligence Service. It was later found that it would be possible to form only two sections of 849th S.I.S. and the 52nd Wireless Intelligence Section (British) was loaned to us to serve as the third intelligence unit.

The larger unit, Detachment 1 of the 128th Signal R.I. Company, and Detachment A of the 849th S.I.S., was to operate under the direction of Seventh Army. Detachment 2 of the 128th Signal R.I. Company and the British 52nd Wireless Intelligence Section was to operate under II Corps. Detachment 3 of the 128th Signal R.I. Company and Detachment E of the 849th S.I.S. was to operate under the 3rd Division, Reinforced.

It was agreed that advance parties with II Corps and 3rd Division would be with the assault group. Each group would consist of one officer from the Signal Intelligence Staff, three code clerks and three radio operators from the 128th Signal Radio Intelligence Company. Each group would be equipped with a 3/4-ton truck, and SCR-188 transmitter-receiver, and a special cipher system.

The purpose of the advance parties was as follows: The remainder of the three detachments of the 128th Sig. R.I. Company and the 849th S.I.S. were to operate in the Bizerte area until time as there was established in Sicily a secure bridgehead of approximately 10 miles. The bulk of the

SECRET

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

128th/849th organization remaining in North Africa would forward any intelligence through its own channels of communication to the advance party who would give it to his G-2.

During the planning stage of the operation it was assumed that the remainder of the 128th/849th would be brought to Sicily about D plus 20. The remainder of the three dets, would then go to their assigned units, join up with the advance party, and begin normal operations.

Operations

The three units of the 128th/849th were set up and operating according to plan on 20 June in the Bizerte area. Each of the three units were physically removed from one another in order to simulate the actual working conditions anticipated later.

Enemy intercept and the intelligence derived therefrom was not too successful, mainly because of the difficulties of intercept expected when operating at such distances from the enemy. However, sufficient training and continuity was obtained during this period to show that all possible effort to provide preleading information is warranted.

The advance parties left their respective units late in June and as no communication with them was planned prior to landing in Sicily, nothing further was heard from them until after the invasion.

On or about D plus 7 it was realized that events were moving far ahead of schedule and it was apparent that the operations of the 128th/849th could be carried on far better in Sicily than in North Africa. Transportation arrangements were made and they arrived in Sicily on August 9.

On 10 August the following movement of units were made: Detachment 1, 128th Signal R.I. Company with Detachment A of the 849th S.I.S. to San Stefano with Seventh Army; Detachment 2, 128th Signal R.I. Company with 52nd Wireless Intelligence Section to Hq II Corps. In compliance with the general policy of not placing these units below Corps level, Detachment 3 of the 128th Signal R.I. Company with Detachment E of the 849th S.I.S. was held in San Stefano at Army Headquarters to work as a unit in order to get as much field experience as possible.

Considering the lateness of arrival in the theater and the scrambled state of communications on the part of the enemy at that time, the few items of intelligence gained from PI/SIS activity were about what could have been expected. It is believed that enough intelligence of value to G-2 was obtained during this extremely short period of operation to warrant bringing the unit to Sicily.

The combined organization of detachments of a Radio Intelligence Company (approximately 80 men) with attached Signal Intelligence personnel (approximately 20 men) working with Army and Corps Headquarters as exemplified in the combination of the 128th Signal R.I. Company and the 849th S.I.S. and their assignment as in this operation, demonstrates the necessity of these two seperate units working together to accomplish a single objective.

The desirability of keeping the organization in its present highly mobile state cannot be overemphasized. It is absolutely necessary that these units maintain as close physical contact with their assigned headquarters as is possible.

The correctness of the inclusion in T/O of Army Headquarters Staff of an officer who controls these SI/SIS units at Army and Corps who acts as Army G-2 adviser in Signal Intelligence matters is apparent. The presence of this officer at Army Headquarters, the assistance he is able to offer the units under his control and the close coordination of their activities are evidence in themselves of the advisability of Army supervision.

"J" Service (Friendly Intercept)

"J" Service, that is the monitoring and reception of friendly radio stations was used by the Seventh Army during the entire Sicilian operation.

"J" Service so called after the British "J" Service, is the monitoring and interception by radio, at a headquarters usually not lower than a division, of the radio nets within that and adjacent units. This service has the dual mission, first to provide early information as to the operations, locations, and movements of friendly forward troops and secondly to monitor friendly nets with the view to checking on the radio security within that unit. During lull periods the receivers may be used to intercept enemy traffic.

"J Service operates directly under the full control of Army G-2. All information is forwarded direct to Army G-2 by the most expeditious means available, but normally through the "J" Service radio net. This information is made available to the division G-2 by means of a telephone connected to the Division switchboard. It is likewise available to adjacent division G-2 through the medium of other "J" stations operating in the Army "J" net.

The following is taken from the report of the "J" Service control officer, Seventh Army, and shows the type of intercepts derived from this service.

Use of Individual Codes

Numerous instances have occurred where our "J" service, without any prior knowledge, have kept track of the movement of friendly troops by the interception of non-standard codes. It must be assumed that the enemy can likewise make use of this same information.

The use of a standard code throughout an Army or independent corps, frequently changing the reference points or other distinguishing items, does not identify any particular unit of the Army or corps.

Army Pictorial Services

The photographic coverage on Operation "HUSKY" began some thirty days prior to the 7th Army Invasion of Sicily.

A complete pictorial record in both still photographs and motion pictures was made of the tremendous preparations for the invasion, the vast number of large and small craft that were to be used, the extensive training schedule for the troops that were to take an active part, and of numerous other activities that were then in full progress.

On all tactical maneuvers such as Paratroop landings, amphibious invasions, pill-box destruction, and street-fighting, live ammunition was used; these scenes were all very impressive and photographed through night-effect filters helped stretch the imagination.

Signal Corps Communications coordinating Air-Borne Artillery fire and troop movements were filmed.

The primary purpose for making these scenes was for an introduction of the Seventh Army in the final editing of a feature story and full length motion picture on the invasion of Sicily. However, incl. #1, a summarized critique direct from Washington, D.C. on this picture material, disclosed many other interested users.

On the invasion and throughout the entire Sicilian Campaign a total of thirty-eight Signal Corps Photographers were in the theater; six officers and thirty-two enlisted men.

Thirty-two of the above photographers were attached to the various tactical units and embarked for the invasion; this gave excellent photographic coverage while at sea and on land.

Two Signal Corps photographers volunteered for photographic assignments with the 82nd Air-Borne Division. One was assigned to the 505th Paratroop Regiment, and although he had never made a parachute jump before, he was dropped with that unit behind the enemy lines the night of July 9-10, 1943. The other photographer was assigned to a glider unit.

Special Assignment Photographic personnel under direct control of Seventh Army and not attached to any major tactical units were invaluable for getting the most photographic coverage with a limited number of Signal Corps photographers, and available camera equipment. They were comparable to reserve tactical units in so far as they were constantly shifted from one combat area to another, wherever, and whenever tactical situations required additional photographic coverage; or they were available for other important activities or special events within the theater.

C O P Y

WAR DEPARTMENT
Bureau of Public Relations
WASHINGTON DC

C O P Y

31 July 1943

SUBJECT: Film Record of Invasion Rehearsal.

TO : Brig. General Robert A. McClure
Assistant Chief of Staff, G-2
Allied Headquarters in North Africa
APO 512, c/o Postmaster, New York

1. The pictorial record of the rehearsal of the Sicily Invasion was the most perfect war coverage in the photographic medium seen during this war.

2. A letter from Pathe News in regard to this material reads as follows:

> "In our make-up last night we devoted approximately 800 feet to your recent material on 'rehearsal for Sicily Invasion'. It was magnificent film. Please convey our respects and our gratitude to all those responsible."

3. All the other newsreels used large quantities of this material. It made an impressive presentation of the thoroughness with which our soldiers are trained for an invasion and of the excellence and abundance of material with which they are equipped. There is no doubt that such pictures as these provide a firm cement for binding the home fronts and fighting fronts together.

S/
CURTIS MITCHELL
Colonel, A.U.S.
Chief, Pictorial Branch

HEADQUARTERS
NORTH AFRICAN THEATER OF OPERATIONS
UNITED STATES ARMY
APO 533

In reply refer to: AG 330.13/069 SIG-O

SUBJECT: Photographs

TO : The Commanding General, Seventh Army, APO 758, U.S. Army.

1. The following letter addressed to this headquarters from the War Department, Adjutant General's Office dated 4 August 1943 commending the still picture coverage of the Sicilian operations is quoted for your information:

> "The prompt and efficient manner in which the spot news pictures of the Sicilian invasion were transmitted to the United States was highly commendable. Selection of photographs for transmission by Radio Telephoto was particularly good. Newspapers throughout the country gave front page space to these pictures every day during the inception of the campaign. One New York paper used thirteen Signal Corps pictures in one issue. Photographs of the invasion sent through the usual channels are arriving promptly and are meeting with an enthusiastic reception by the Press. In view of the difficulties involved in getting the films from the front, processing, printing, captioning and shipping in record time, the results are gratifying and reflect credit on the photographic personnel concerned.
>
> By order of the Secretary of War:
>
> S/ L. M. Chitwood
> Adjutant General."

2. The photographic personnel assigned and attached to your command are to be commended on the quality of the work they performed under hazardous and difficult conditions and on their energy in rushing the exposed films to this headquarters for transmission to the United States.

By command of General EISENHOWER:

SEP 15 43 AM
RECEIVED

WAR DEPARTMENT

Filed: AG 333.53 (2 Jul 43) OR-S

Subject: Review of Film

To: Commanding General
U. S. Army Forces
A. P. O. 512, % Postmaster
New York, N. Y.

Attn: Signal Officer

From: Army Service Forces
Adjutant General's Office
Washington, D. C.

Date: 2 July 1943

1. Official United States Army Signal Corps motion pictures exposed in your theatre and received in Washington, D. C. have been reviewed by the War Department Board of Review.

2. Critiques on these motion pictures are summarized as follows:

Shipment No.	Cameraman	Subject	Critiques
S-55 35mm B&W	Sgt. Morang	King George visits troops.	Photography and coverage good. Some good close-ups. Subject of interest for Public Relations.
S-56 35mm B&W	Alcock	King George and Correspondents.	Coverage and photography good. Here, too, some good close-up work. Good Public Relations material.
S-58 35mm B&W	Sgt. Morang	Invasion Maneuvers, Landing Practice, Reduction of Pillbox; Street Fighting Training; Glider Operations; Waterproof Vehicle Tests; Parachute Maneuvers.	A good deal of interesting and well photographed material in this 18,000 feet of film. Each subject very well covered. Parachute. Glider and Invasion subjects extremely good. These subjects being utilized by Public Relations, Ordnance, Marine Corps, Quartermaster, Military Intelligence, Administrative Services, Air Forces, Engineers, and Signal Corps.

By Order of the Secretary of War:

RECEIVED JUL 18 P.M. Signal Section A.F. H.Q.

Adjutant General

W. D., A. G. O. Form No. 1000 September 15, 1942

Signal Supply During Active Operations In Sicily

Signal Supply for the troops in Sicily started on 10 July 1943, with the opening of Sub-Task Force Signal Dumps - one for each of the forces as follows:

At Vittoria for CENT Force.
At Gela for DIME Force.
At Licata for JOSS Force.
At Gela (same dump as DIME) for KOOL Force.

Assault phase Signal supplies for these Sub-Task Forces were placed in these dumps and issued under control of Sub-Task Force Signal Officer until the dumps reverted to Seventh Army control. These dumps were operated by S. and I. Section of the 206th Signal Depot Company, which were attached one each to CENT, DIME, and JOSS Forces. They were assisted by personnel of the Sub-Task Forces.

On 16, 17, and 18 July 1943, Sub-Task Forces were dissolved and all units reverted to Seventh Army control at which time all Sub-Task Force Dumps became Army Supply Points controlled by Army. On 16, 17, and 18 July 1943, the Special Engineer Brigade was given the responsibility of unloading all supplies and operating all depots and dumps, under the direction of the various supply services through G-4 Seventh Army.

For the assault phase, a seven day maintenance of Signal supplies was carried by the DIME Force. The CENT and KOOL Forces each carried twenty-one day maintenance.

About 20 July 1943 the units of II Corps had pushed on beyond Caltanissetta and were too distant from their A.S.P. at Gela. A new Signal A.S.P. was established for the units of the II Corps at Caltanissetta about this time. Also the A.S.P. at Vittoria was abandoned and all stocks moved to Gela Dump. Unloading of supplies at Vittoria stopped and there was no need for further activity in this area.

The Caltanissetta Signal A.S.P. was supplied from Gela and Licata stocks. On 27 July 1943 the Caltanissetta Signal A.S.P. was closed and moved to Petralia, nearer the unit it was serving.

On 27 July 1943 the Palermo Signal Supply Depot was opened in the captured Italian Engineer Depot. In the Italian Army the Engineers have the communication responsibility and therefore had the signal supplies. A lot of usable stock was taken over and much of it issued and used. The 814th Signal Port Service Company came in about this date and since the Engineer Shore Regiments operating the port had their own signal corps personnel, the Port Company was used to open and operate the depot.

On about 29 July 1943 the Gela dump was abandoned and all stocks moved to Petralia and Licata. The S. and I. Section of the 206th Signal Depot Company under Lt. Burns, was then moved to Palermo to help establish and operate the Base Depot.

On about 1 August 1943 the balance of the 206th Signal Depot Company arrived at Palermo and were moved to the Base Depot, Palermo, and began the operation in conjunction with the 814th Signal Port Service Company.

On 3 August 1943 the Signal A.S.P. serving II Corps units was moved forward to Nicosia. Several days later the A.S.P. and a wire dump was established at Orlando as a branch of the Nicosia Depot.

Supplies were moved forward by daily train from Licata, supplemented by truck transportation and by truck and train from Palermo.

As soon as possible after the units reverted from Sub-Task Force control to Seventh Army control, the three repair sections of the 177th Signal Repair Company were detached from the units to which they were assigned and were assigned one each to the three S. and I. sections of the 206th Signal Depot Company. These repair sections worked in and near the A.S.P.'s, but on occasions had gone out to units to check and repair their equipment.

LESSONS LEARNED AND CONCLUSIONS

The earliest possible information on the numbers and types of signal units available for an operation is required to permit the Signal Officer to formulate the signal plan.

A complete troop list of units is required early in the planning phase to permit the necessary specialist training and to form a basis for signal supply.

If an Army Base Section is required, its signal personnel must be assembled at the beginning of the planning phase.

Special equipment requirements must be made known as early as possible to permit the procurement thereof.

Signal operation personnel must always accompany their equipment during shipment and must assist in the loading and unloading of this equipment to assure proper handling and safeguarding of signal items.

All Signal Corps agencies of the various sections of the Air Corps must be coordinated under a single head. All Air Corps sections have important operating requirements, both for wire and radio. These requirements must be coordinated by an Air Corps Officer.

In amphibious operations, the Signal Section must be divided into two echelons, each capable of operating independently, in case one is lost during landing operations.

The Signal Section must habitually function in two echelons, one at the Tactical, and the other at the Administrative Command Post.

In a landing operation, when several beachheads are being established, several small, fast, power boats, should be made available to the Task Force Commander for liaison and messenger service between Force Headquarters and subordinate units. In the initial stages of the landing, before roads are cleared for motor messengers, these craft could be of inestimable value.

TRAINING

In any future operation involving the use of signal troops, the training of such troops must be conducted by the unit base section, under the supervision of the Army Signal Officer. This instruction must be continuous except during actual operations.

More thorough training of Signal troops is required in mine and booby trap detection and removal.

Signal Battalions need far more training and instruction in the use and maintenance of teletypewriter equipment.

Each Construction Company of the Construction Battalion or Army Signal Battalion must be primarily trained and equipped for open wire construction. Construction units for Corps and Divisions must be trained and equipped for both open and field wire construction.

Every Signal Corps combat unit should go into battle with an overstrength of junior officers and enlisted men. At the end of any campaign and prior to the start of the next, there is always a demand for experienced junior officers and non-commissioned officers. This experience can only be acquired in actual combat. It would then be possible to take a number of such officers and men from these units to provide an experienced cadre without materially wrecking the parent organization.

Cable splicers assigned to signal battalion have insufficient knowledge of their specialty.

MESSAGE CENTER

There must be a redefinition of the Adjutant Generals, mail and distribution sections, and the Signal Corps Message Center duties. Messages incoming and outgoing are unnecessarily delayed by having to pass through two offices at one headquarters before delivery to addressee.

The majority of all messages transmitted are overclassified, both as to priority and security.

Messages to be relayed to one or more headquarters must indicate the unit or units to which it is desired a copy be sent, in the address of the message, rather than in the content. Message center personnel must not be expected to search for addressees concealed within the message. This causes delays in transmission, and increases the possibility of error.

More importance must be given to message centers by all units. Uniformly the number and quality of personnel p rovided is inadequate.

Senior field officers must be included in the Army signal section to provide adequate supervision and direction of Army message centers. The message center officer is the key officer connected with the handling of all messages at any headquarters. His duties are similar to those of a traffic manager in a telegraph office. This officer must have all agencies of communications under his control, must know the capabilities and limitations of each and must know instinctively which agency should be used to transmit a message of any priority and security classification. His rank and that of the men serving under him, must be such that this most important task is one sought after rather than avoided.

There is a definite lack of sufficient clerks in the message centers of Army, Corps, and Divisions. (See recommendations for changes under appropriate tables of organization).

Maintenance specialists for code devices including the M-134 (SIGABA) and the M-209 must be included in T/O's for Army and Corps.

The Air-Ground liaison code and the division field code were not used in this operation as the converter M-209 has proven itself to be more secure and much faster to operate with less possibility of error.

RADIO

Tactical radio channels must not be used for administrative traffic during the assault landing period.

Considerably more high-powered radio channels are required by an Army headquarters than can be provided and operated under current tables.

The radio set SCR-193, mounted in a 1/4 ton, 4x4 truck, is the most useful radio set for all around use in sparsely covered and difficult terrain.

It is recommended that link-sign procedure be used only from Division headquarters downward. The units assigned to a division are not so frequently changed and there is less relay traffic; therefore, less confusion results from the use of Link-Sign Procedure. CCBF-1 and CCBP-2 should be used from Division Headquarters upward. Here the frequent changing of Divisions from one Corps to another, the larger volume of relay-traffic, and the existence of several links between the same two headquarters causes unjustifiable confusion if Link-Sign Procedure is used.

OPEN WIRE CONSTRUCTION

The principal Army wire axis should be constructed of 12 gauge, Bronze and Sharp, .104 copper wire or larger.

In both Africa and Sicily rehabilitated civilian commercial circuits were found to be unreliable for the use of carrier equipment.

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

Where several agencies require separate wire channels, priorities must be established by the Army Signal Officer. The following were found to be satisfactory during this campaign:

Priority	For use by
1	Army (common use)
2	Air Corps (exclusive)
3	Army (common use)
4	Air Corps (exclusive)
5	Railroad Service (exclusive)
others	Army (common use)

When moving forward it is better to lay new wire lines than to rely on repaired enemy lines.

Some equivalent to the British Multi-Airline (MAL) construction must be provided for Army and Corps use. The time necessary to build a Rapid Pole Line (RPL) is such that this type of line has been misnamed. Experience has shown that if the materials are available it takes only a short time longer to place 20 foot poles than the 4 x 4 poles of RPL. The shorter height of the MAL could be offset by having a number of 20 foot poles slightly larger in diameter, to be used at road crossings and wherever found necessary. With equal weights of materials considerably more MAL can be built than RPL.

A standardized transposition scheme must be prescribed by the Army Signal Officer to be used by all Signal troops engaged in line rehabilitation. This scheme must be rigidly adhered to, to prevent cross talk and noise as the circuits are extended.

CABLE

Spiral-4 cable does not furnish reliable wire communications. It was found to be extremely temperamental in that an inspection of individual reels before their use would show perfect continuity with no cross talk and after carefully laying several miles it was found to develop cross talk for no apparent reason. A speedy and suitable means of testing spiral-4 without breaking the continuity has not been developed. This causes undue interruptions over both circuits, one which could possibly be used, but which is broken by the lineman testing the other. Its use in the forward area increased communication difficulties and took a considerably longer period to shoot trouble on than wire of the long range type, i.e., W-110-TC, W-110-T10, and W-143. Spiral-4 is particularly susceptible to enemy sabotage in that its size and prominence lets the saboteur know here is an important communication channel and one easily interrupted. This is not the case with the long range field wire as its size is comparable to other field wires and should one circuit of the carrier go into trouble the other could be used as a single channel with telegraph simplex. The repair or reconstruction of open wire lines was found in many instances to be more satisfactory. The value of spiral-4 cable in future field operations is considered as very questionable.

SIGNAL INTELLIGENCE

In future operations involving the use of a Signal Radio Intelligence unit, those persons who are to supervise the operations of the unit must be included in the planning phase, to familiarize themselves with the proposed plan of action. Considerable information as to enemy movements, supply, and disposition would then be available prior to embarkation.

The inclusion of the Army Signal Intelligence officer in the advance group is essential in order to assure the earliest practicable movement of the Signal Radio Intelligence units to the theater.

The most valuable conclusion drawn from Signal Intelligence participation in the Sicilian Operation is that the German Army continues to pass low grade traffic over its radio channels. The interception and interpretation of this traffic will provide valuable information to G-2.

All codes and ciphers used within the Army by subordinate units must be coordinated by the Army Signal Officer. The repeated use of an individual code by a unit easily identifies that unit to an alert enemy signal intelligence service, thereby providing him with early information of the movement or relief of that unit.

TABLES OF ORGANIZATION

Practically all T/O's of Signal units within an Army require changes. In all cases, not enough personnel are provided. Details of the recommended changes will be forwarded under separate cover.

The Signal Battalions serving Army Headquarters require more personnel and more highly trained personnel than those now assigned to Corps.

Among the Army Signal units there must be included an Army Signal Battalion for each Corps assigned or attached to the Army. In addition to the above, there must be included one Construction Battalion, one Operations Battalion which must include one Radio Operations Company, two Signal Depot Companies, one Signal Repair and Maintenance Company, one Signal Photographic Company, one Signal Pigeon Platoon, one Signal Friendly Intercept (J Service) Company, one Signal Radio Intelligence and Signal Intelligence Service Detachment for Army Headquarters, and one such detachment for each Corps assigned or attached to the Army.

There is a definite need for a Signal Air Courier Company, equipped with Piper Cub or equivalent light planes, capable of landing in small fields.

There is a definite need for the Radio Intercept Platoon in the Division Signal Company.

Each Base Section assigned to an Army must have one Signal Depot Company, one Signal Service Battalion, and one Signal Port Service Company, if required by the operation.

RECOMMENDATIONS

That in each headquarters the staff officer approving outgoing messages also assign the priority and security classifications.

That complete troop list be procured in earliest possible phase of planning.

That special equipment requirements be determined as early as possible in the planning phase.

That all Signal Corps and communication personnel be given intensive training in mine and booby trap detection and removal.

That the operating personnel always accompany shipments of communication equipment.

That the Army General and Special Staff personnel be instructed in the functions, capabilities, and limitations of signal communications.

That all staffs be given instruction in the classification of messages, both as to precedence and security.

That a separate administrative radio net be provided during the landing operations.

That originators of messages be held responsible that addressees are listed outside the body of the message.

That subordinate units be required to use the authorized Army codes only.

There is a definite need for code practice equipment in the Army to permit training in radio operation and procedure

Facsimile equipment is needed in the Army Headquarters.

Radio-teletypewriter equipment is required at Army Headquarters.

That Base Section or SOS Signal Section personnel be available to work with the Army Signal Section during the planning phase.

That the Air Corps coordinate communication requirements for wire circuits for each of its sub-sections taking part in an operation.

That properly designed and constructed headquarters ships be provided for amphibious operations.

That Signal Corps personnel operating on a twenty-four hour basis be authorized one and one-third rations. Many Signal troops are required to operate all night, requiring an extra meal at midnight.

TABLES OF ORGANIZATION

That more Signal Construction Companies be activated to provide additional units of this type for battalions where necessary.

That a Signal Detachment, Friendly Intercept ("J" Service) be activated and provided for each Army.

That Signal Service Battalions, made up of limited service troops, be made available for the use of Base Sections, or the SOS, when required.

That Signal Air Messenger Companies be organized and one such company be assigned to each Army.

That an overstrength of fifteen percent for enlisted men and officers below the grade of captain be made available to all Signal units entering combat.

DIVISION SIGNAL COMPANY

The following changes in Tables of Organization of the Division Signal Company are recommended:

T/O should be revised to make a Signal Battalion of the Signal Company. Present company is too bulky to act efficiently as a company for adequate training, operation, and administration.

The Division Signal unit should be furnished personnel and equipment for communication to the next lower echelon below divisions to and including at least as far as Infantry and Artillery Battalions.

The Message Center Officer of divisions should have the rank of captain, and have at least two assistants in the grade of 1st or 2nd Lieutenant.

WIRE CIRCUITS

That the main Army wire circuits be constructed of heavy copper wire.

TRAINING

That immediate steps be taken to train Signal Corps Officers in Army Signal Supply.

That all cable splicers graduated from the Signal Corps schools be given a further training period of at least two weeks working as a helper to a cable splicer of the Bell Telephone or independent telephone company. Arrangements could be made with these companies operating in the vicinity of the school for such training.

That all Signal Corps and communications personnel be given intensive training in mine and booby trap detection and removal.

That originators of messages be held responsible that addressees are listed outside the body of the message.

That radio procedure outlined in CCBP-1 and CCBP-2 be used only in the Army — Corps — Division Nets.

That Link Sign Procedure be used in division and lower nets.

MODIFICATION OF EQUIPMENT

Signal Corps units should use standard, rather than special, types of trucks.

SIGNAL SUPPLY

More emphasis must be placed on the training of Signal Corps officers and enlisted men on Army supply problems. New officers assigned cannot acquire the necessary experience in less than six months. Army Signal Supply is a different specialty than routine base signal supply.

A pool of Signal Corps equipment must be maintained under the direct supervision of the Army Signal Officer. Many emergencies occur requiring the use of items held in such pools for which no time can be allowed for authorization and procurement through other channels.

I PLANNING PHASE

With the announcement of the part to be played by Headquarters, I Armored Corps, Reinforced, in the planning and execution of Operation "HUSKY", the Medical Section immediately started preparation to provide for the medical support necessary for the Task Force.

Pertinent information was extracted from Reports on Sicily. Thus a clear picture of the sanitary conditions on the island, and on suitable sites for medical installations, was obtained.

Upon receipt of the list for the allocation of medical units assigned to this Force, a tentative plan was drawn up. This plan was based upon the estimated requirements of each Sub-Task Force, taking into consideration the objective, terrain, number of troops, and estimated total number of casualties.

The basic principle was to support each RCT in the Assault with a Collecting-Clearing Company of a Medical Battalion. The Sub-Task Forces were to have a Field Hospital with Surgical Teams, and an Ambulance Platoon, in the Assault.

By D/4 the Evacuation Hospitals (400 bed) were to arrive, one to each Division. Later, on call, Evacuation Hospitals (750 bed) were to arrive in the proportion of one to two Evacuation Hospitals (400 bed).

Other medical units such as Veterinary Detachments, Malarial Control Units, Station, General, and Convalescent Hospitals, Medical Laboratories, and Hospital Ships, were set up in the order of priority consistent with the anticipated demand for them in Sicily.

Medical Supply - Medical Supply played an important role in the planning for the Operation "HUSKY". Requisitions for medical supplies and equipment were made out in advance to allow time for shipment from the United States. These requisitions included maintenance supplies and extra equipment to cover losses during the Operation. Each one covered a 15-Day period, with additional items to build up to a 30-Day reserve. Advance Sections of a Medical Supply Platoon were given a high priority in order to set up an efficient and adequate source of medical supplies as early as possible.

Medical Reports and Statistics - Realizing that many medical units in the field did not have access to current Army Regulations, Circulars, and Official Letters, a pamphlet was compiled to serve as a guide for the proper preparation of the medical reports. To indicate the scope of the instructions and subjects covered in this booklet, a copy of the Index to the Report Guide is included. (See Annex No. 1).

Also revisions of two Medical Department forms were made. The 86e was revised and redesignated as the Station Blotter (See Annex No. 2). The 86f was modified to include additional pertinent data necessary in amphibious operations. Medical administrative experience gained during the African Campaign formed the basis for the revision of these two forms.

Prior to the operation each enlisted man in the Medical Section was given an intensive training course dealing specifically with casualty reports and compilation of technical medical data.

Training - A rigorous training program was instituted early in the planning phase. With the arrival of medical installations in the Mostaganem-Oran area, an intensive schedule of Amphibious training was initiated. This was carried out under the supervision of the Fifth Army Invasion Training Center at Arzew Beach. At this time the 56th Medical Battalion was divided into 3 Collecting-Clearing Companies, a Provisional Clearing Platoon being formed out of elements from the station and litter bearer platoon. Very little extra equipment was necessary for this change. The above reorganization in the corps medical battalion was affected after a thorough study of the requirements of a medical battalion during invasion operations. (See Annex No. 3).

The culmination of the medical planning was the publishing of Medical Annex No. 2 to Administrative Order No. 1.

II MEDICAL SUPPORT

Medical support proceeded according to plan with the initial landings of the Sub-Task Forces. Army medical units attached to the Sub-Task Forces, i.e., Collecting-Clearing Companies of the Corps Type Medical Battalion, and Field Hospital Platoons with Surgical Teams attached, landed during the period H/6 hours and D/2 to render additional support necessary to Divisional Medical Battalions to care for non-transportable casualties, and to aid in the beach evacuation. These units moved in close support of the combat troops, as outlined in the reports of the Sub-Task Forces, and of the individual units.

On D/2, personnel of the 11th Evacuation Hospital, consisting of 2 officers, 135 enlisted men, and 42 nurses, landed without equipment. By D/5, the remainder of the personnel and all the equipment had arrived and the hospital opened D/5 in the vicinity of Licata. Personnel and equipment of the 93rd Evacuation Hospital began to arrive on D-Day. By D/5, the majority of this personnel and equipment had arrived, and by D/6, the hospital opened 5 miles north of Gela. The 15th Evacuation Hospital was also scheduled to arrive on D/4. The personnel of this hospital did arrive on D/4, but the equipment did not begin to arrive until D/6. By D/10, sufficient equipment had arrived for the hospital to open in the vicinity of Caltanissetta.

On D/6, the Army medical units supporting the DIME and CENT Forces (54th Medical Battalion, 1 Collecting-Clearing Company of the 51st Medical Battalion, 11th Field Hospital with Surgical Teams attached, 1 Platoon Company A, 36th Ambulance Battalion, the 15th Evacuation Hospital, and the 93rd Evacuation Hospital), were attached to the II Corps. Army medical units supporting the JOSS Force, (56th Medical Battalion less 1 Collecting-Clearing Company, 1 Collecting-Clearing Company 51st Medical Battalion, 10th Field Hospital with Surgical Teams attached, and the 11th Evacuation Hospital), remained under the 3rd Infantry Division. 1 Collecting-Clearing Company of the 56th Medical Battalion reverted to Army control and was attached to the 82nd Airborne Division.

On 22 July, an advance section of the 128th Evacuation Hospital arrived at Licata. It was not until 31 July that sufficient personnel and equipment arrived, and it was on this day that the hospital opened 4 miles west of Cefalu. This hospital operated as an Army installation to support the II Corps and as a holding unit for Hospital Train transfer of casualties from the II Corps medical installations to Palermo.

On 27 July, the advance section of the 91st Evacuation Hospital, consisting of 4 officers and 59 enlisted men, received the majority of their equipment. The hospital was opened in the Policlinico Hospital, Palermo, and began to receive patients from the II Corps and 3rd Infantry Division medical installations. On 29 July, emergency personnel and equipment was provided the 91st Evacuation Hospital to care for the large number of patients received. On 30 July, the remainder of the personnel and equipment of this hospital arrived.

On 1 August, the 11th Evacuation Hospital and the 10th Field Hospital were attached to the II Corps.

On 6 August, the nurses of the 59th Evacuation Hospital landed at Palermo. On 8 August, the remainder of the personnel of the 59th Evacuation Hospital arrived Palermo, without their hospital equipment, and located at the Policlinico Hospital in Palermo, adjoining the 91st Evacuation Hospital. Sufficient equipment was obtained from the 91st Evacuation Hospital and from the Medical Supply Depot, and so they helped in the care of the large number of patients admitted to the 91st Evacuation Hospital.

On 10 August, the equipment of the 59th Evacuation Hospital arrived and the hospital opened on 12 August prepared to accept 1000 patients.

When hostilities ceased on 18 August, the hospitals were located as follows:

93rd Evacuation Hospital	-	Nicosia
15th Evacuation Hospital	-	Nicosia
59th Evacuation Hospital	-	Palermo
91st Evacuation Hospital	-	Palermo
11th Evacuation Hospital	-	Capo d'Orlando
128th Evacuation Hospital	-	Caronia
1 Platoon, 11th Field Hospital	-	Randazzo
11th Field Hospital (-1 Platoon)	-	Cesaro
1 Platoon, 10th Field Hospital	-	Barcelona
10th Field Hospital (-1 Platoon)	-	Stas Acque Dolci

The movement of the hospital installations from D-Day to the end of hostilities in Sicily is shown on the attached diagrams and map (Annexes Nos. 4 and 5).

III HOSPITALIZATION

During the active part of the campaign, it was planned to use only Army type hospitals. The fixed type hospitals were to arrive at the cessation of hostilities, when shipping would be less acute and there would be more need for that type of medical and surgical work.

The 2 Field Hospitals were placed in the Assault Group, and the Evacuation Hospitals (400 bed) were scheduled to arrive in Sicily on D/4. However, when plans were submitted by the Sub-Task Force Commanders, it was apparent that certain changes were being made in the medical plan, the most notable ones being, the deletion of the Field Hospitals from the Assault Group, and the delaying of one Evacuation Hospital (400 bed) until D/8. Since the minimum required hospital beds had been set up to accompany the Assault Phase, the necessity of having hospitals arrive early was insisted upon. As a result, the Field Hospitals, or platoons of same, sailed with the Assault. However, 1 Evacuation Hospital (400 bed) in the JOSS Force, still remained scheduled for the D/8 convoy.

The Field Hospitals operated in support of the Clearing Stations. One Field Hospital was set up most of the time as a unit, while the other functioned in three separate platoons. A study of the administration, mobility, and work performed, indicated that these hospitals operated more efficiently when utilized as separate platoons. There were only sufficient officers for the administrative work, the professional work was performed by the attached Surgical Teams.

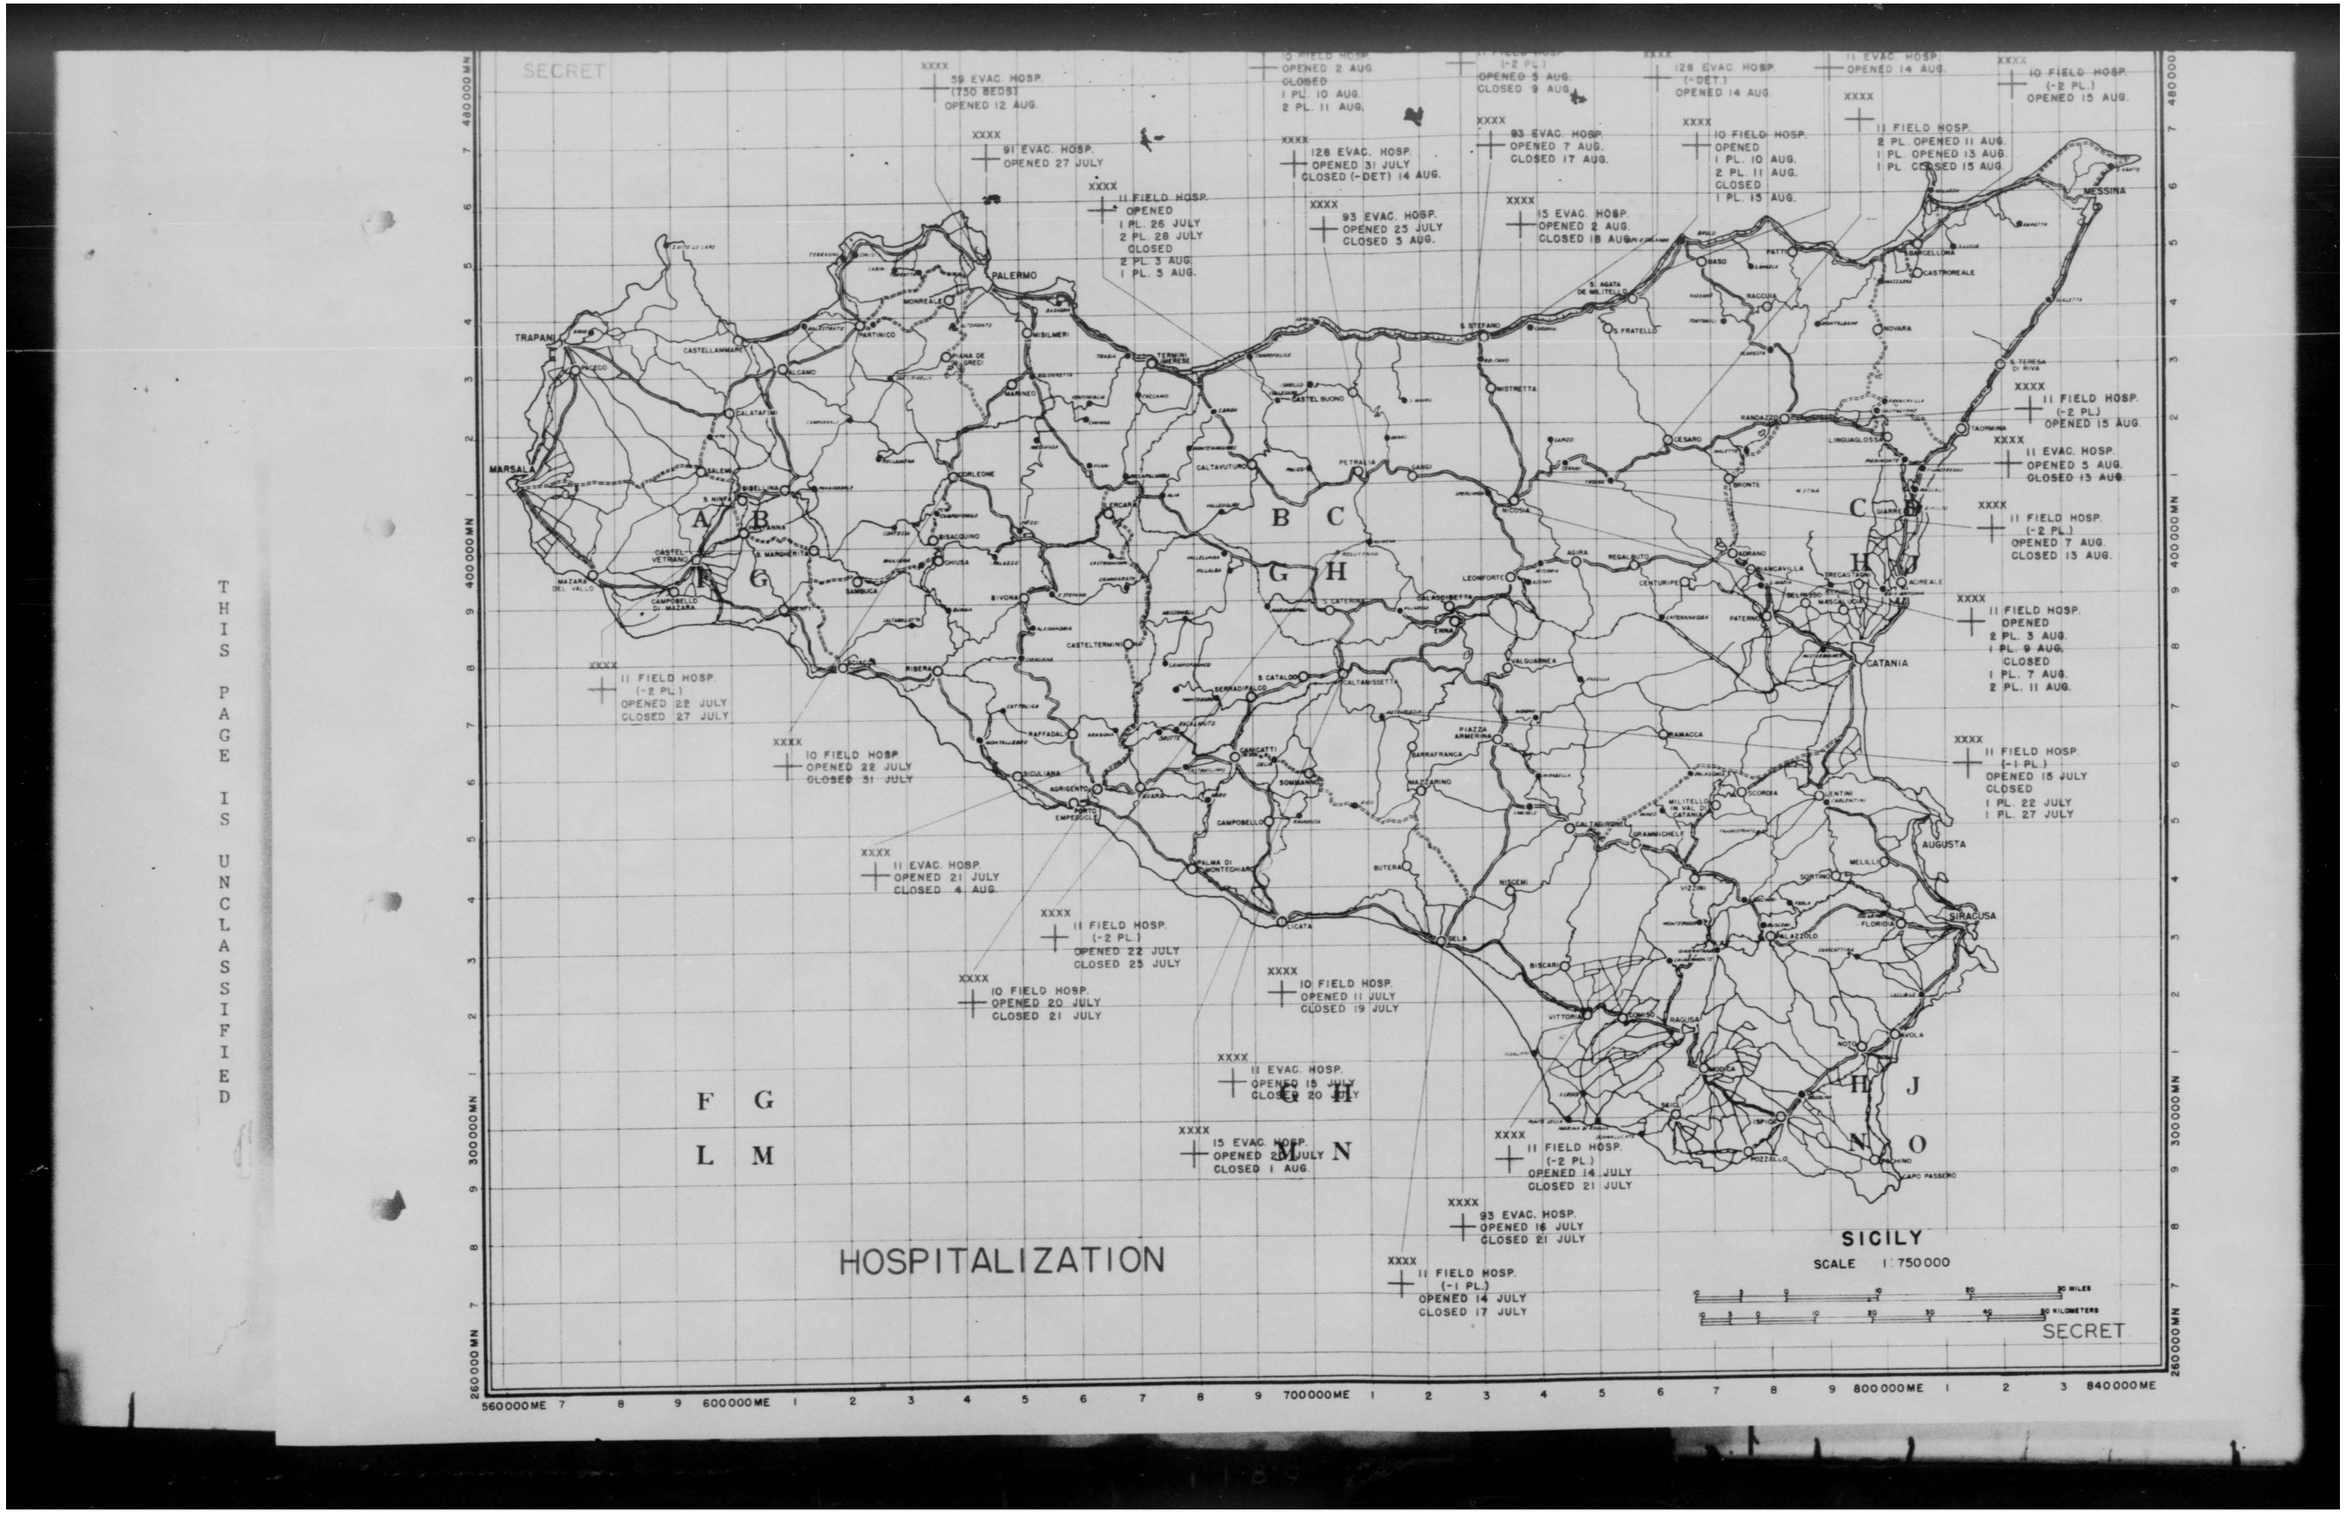
Most of the Evacuation Hospitals did not arrive on schedule. Frequently, the personnel and the hospital equipment were on separate convoys. This was a definite handicap, as personnel without equipment became a liability rather than a help at a time when the need for hospitals was vital.

The Evacuation Hospitals (750 bed) were requested early and repeatedly. Due to limited shipping, only one arrived and opened on D/33.

Expansion was necessary as the hospitals filled to capacity. The stock of medical supplies planned for such a contingency, and the use of captured medical equipment, made this possible. All hospitals increased their capacity by 200 to 400 beds. However, this did not affect their efficiency.

To further relieve the congestion, Clearing Platoons of the Corps Type Medical Battalions were expanded to the maximum and set up in the vicinity of the Evacuation Hospitals. Thus utilized, they augmented the hospital bed capacity by 100 to 200 beds.

To eliminate long ambulance hauls, an Army Evacuation Hospital (400 bed) was established well forward at the junction of the roads leading from the Corps Evacuation Hospitals. All Corps casualties were filtered through this installation.



The Clearing Platoons were employed as holding units at Airfields, and held up to 250 patients. This facilitated air evacuation, since the transports did not arrive or depart on schedule.

It is evident, the most than can be expected of Field or Evacuation Hospitals, is that they render early definitive treatment and only to hold casualties until they become transportable. Therefore, it is necessary that additional hospitalization be provided in the Combat Zone to care for those patients returnable to duty.

THIS PAGE IS DECLASSIFIED IAW EO 13526

IV EVACUATION

Due to the geographical location and the type of terrain on the Island, all methods were employed for the transportation of casualties.

Ambulances played the major role. After the initial action, one Medical Battalion and an Ambulance Company reverted to Army control, in order to clear forward hospitals.

The mountainous terrain and the narrow winding roads made ambulance evacuation impossible from several of the combat units during one phase of the campaign. Litter bearers and pack mules were then used to transport the casualties. Fortunately, the rapidly changing picture required the use of this means of evacuation for only a few days.

With the stabilizing of action along the northern coast of Sicily and with the eastward advancement of the troops, Palermo became the center of evacuation. To facilitate the transporting of casualties rearward, a captured Italian Hospital Train was completely staffed, including Nurses, equipped, and set in operation. An Army Evacuation Hospital was located close to the train terminal at Cefalu on 31 July, one day prior to initial trip of the train.

Provision was made to give the patients food and drink, including a hot meal, while enroute.

The first Hospital Ship arrived on D/5. Initially, there was difficulty in obtaining Hospital Ships as requested. Later, a definite policy was established and they arrived fairly close to schedule.

Hospital CARRIERS were more adaptable than Hospital SHIPS. Due to the condition of the Ports, it was impossible for these ships to dock. Each Hospital Carrier was equipped with 6 water ambulances and was able to transport casualties quickly and easily from the beaches, in contrast to a Hospital Ship where it was necessary to secure small craft. These boats were often not available or dock space was inadequate, and thus there was some difficulty in transferring patients from shore to ship. Also unloading the casualties from small craft to the ship was slow and arduous, and would have been impossible in a rough sea. On the other hand, water ambulances were lifted to the deck of the ship by electric winches, making transfer easy.

Air Evacuation was established on D/4. As the tactical situation developed, more Airfields became available for air evacuation. Through constant liaison with the Air Evacuation Officers, who landed on D/6, it was possible to learn when airfields would be available. Upon receipt of this information, a Clearing Platoon was moved to the vicinity of the airport and set up in readiness to hold casualties. In order to spare patients the discomfort of a long ambulance ride, and to shorten the time of evacuation, airfields or landing strips were established close to the forward areas.

It was apparent in this campaign that a type of light plane with a slow landing speed, or a Helicopter, should be available for the transporting of patients from isolated areas, and also for the movement of casualties unable to stand an ambulance trip over rough roads. The Evacuation Officer should be provided with a similar plane to enable him to keep in close contact with the scattered medical installations.

Significant Dates -

Air Evacuation began:

Gela	-	14 July
Licata	-	14 July
Agrigento	-	23 July
Castelvetrano	-	24 July
Palermo	-	27 July
Termini	-	5 Aug.

Hospital Ship and Hospital Carrier Evacuation began:

Gela	-	15 July
Scoglitti	-	16 July
Licata	-	17 July
Palermo	-	29 July

V CARE OF SICK AND WOUNDED

During the invasion phase of the Sicilian Campaign, rapid evacuation of the casualty after preliminary treatment in the Clearing Station, was successfully executed. The non-transportable casualty was treated in the Platoon of the Field Hospital, which, with the attached Surgical Teams, was prepared to treat all types of battle casualties.

With the arrival in Sicily of the Evacuation Hospitals, a 7-day holding policy was established. The transportable casualties were sent directly to the Evacuation Hospitals by the Divisional Clearing Stations. The non-transportable casualties continued to be cared for by the Platoons of the Field Hospitals, in direct support of the Divisional Clearing Stations, until the patient's condition permitted transfer to an Evacuation Hospital. In view of the fact, that all the Evacuation Hospitals did not arrive as planned, it was found necessary to expand the hospitals to the maximum and yet keep them as mobile as possible.

The majority of the serious wounded, especially chest and abdominal wounds, received definitive treatment in the Field Hospital Platoons. The less serious wounds and injuries, most of the intracranial wounds and the majority of the sick, were treated in the Evacuation Hospitals. The calibre of the medical care given and the surgery performed was superior.

During the period D-day through 18 August, there were 20,734 hospital admissions of U. S. Army personnel. Of this total 7,414 were caused by wounds or injuries; the remaining 13,320 admissions were of patients in the disease category.

Malaria far exceeded all other admissions of any given type, 4,440 cases were reported. As proved by smear, Benign Tertian was by far the most common. A large group of cases was diagnosed as malaria unclassified on the basis of the clinical symptoms, even though negative laboratory findings were reported. Many of these cases, after the administration of adrenalin (1cc), a blood smear taken in one hour showed parasites in the peripheral blood. Coma cases were singularly infrequent, and almost all cases responded promptly to intravenous quinine therapy. Complications as a result of the Malaria therapy, other than infrequent cases of secondary anemia and haemolytic icterus, were not encountered.

The Diarrheas comprised the next largest group of admissions. The total number was 2,470. Of these, 1,837 were classified as Simple Diarrhea, and a smaller group 600 was classified as Dysentery. Those cases showing febrile reactions, dehydration, blood, pus, and macrophages in the stool, were considered as Bacillary Dysentery. The very few cases of Amebiasis were diagnosed after combined sigmoidoscopic and stool examination. Treatment was symptomatic in the simple cases. Sulfaguanadine was used in the early Bacillary and Sulfadiazine in the late Bacillary types. Cases of Amebiasis were treated with Emetine and Carbasone. Sigmoidoscopy was used whenever possible and proved of great value in differentiating Amebiasis, Bacillary Dysentery, and cases of functional and simple diarrheas.

"Fever of Unknown Origin" was a diagnosis reported in a large number of cases. Sandfly Fever, undiagnosed as such, was the disease responsible for most of these cases. Undoubtedly, cases of Malaria, sufficiently suppressed by Atabrine so as to be subclinical in type, as well as cases of Influenza and Upper Respiratory Disease, also contributed to this group.

Skin Lesions caused relatively few hospital admissions. The majority of these consisted of cases of Pyodermia and Furunculosis, and were considered due to infected insect bites and irritation of clothing in the presence of profuse perspiration. Cases of Trichophytosis and severely blistered and macerated feet were admitted and were usually due to prolonged marches, heat, sleeping with shoes on, and inability to adequately care for the feet.

Communicable Diseases were reported in 905 cases. The majority of these were cases of Acute Upper Respiratory Disease and Influenza. No particular or unusual problems were encountered.

Venereal Disease was not a problem during this campaign. There were 301 cases reported, of which 232 were Gonorrheal Urethritis. The uncomplicated cases of Gonorrhea were started on treatment and then returned to duty for continuation of treatment under the supervision of the Unit Surgeon, providing that Unit was not engaged in active combat.

Neuropsychiatric diagnosis was responsible for 702 hospital admissions. In practically all instances, the mental conflict appeared to be related either directly or indirectly to combat service and experiences. 386 of these cases displayed manifestations too severe to warrant an early return to duty and were evacuated. 42 cases remained in the hospitals as of 20 August. Some of these patients admitted with the diagnosis of Anxiety State, had an associated Malarial Parasitization. In several of these cases, Malaria therapy caused a disappearance of the various vague subjective complaints, which had originally been ascribed to the Anxiety State, but which probably represented symptoms of subclinical Malarial Fever. One may conclude that it is erroneous and even dangerous to accept a diagnosis of Mental disease at its face value in a Malarial area.

The Surgery performed was skillful. 2,308 casualties due to injury, and 5,106 battle casualties were admitted. No serious difficulties with regard to surgical work were encountered, nor were there any unusual complications or problems.

Fluroscopic and X-ray examination of all cases of injury caused by foreign bodies proved exceedingly important. It was very evident that in all the hospitals, the volume of Fluroscopic and X-ray work done was in excess to the proportion of the personnel and equipment allowed by the T/O and T/BA. It is commendable that these difficulties were overcome so that every casualty was adequately treated.

Gas Gangrene had been expected to be a greater problem than experienced in the Tunisian Campaign. However, the incidence of gas gangrene was very low. This can be attributed to two principal factors: (a). Complete debridement and removal of all foreign bodies and debris. (b). Administration of prophylactic dose of 100,000 units of Gas Gangrene Polyvalent Antitoxin in all cases where the possibility of gas gangrene was evident.

The Dental health of the Command was good and presented no problems during the Campaign.

The following is a classification of wounded admitted to hospital during the period 10 July to 18 August 1943 inclusive:

a. Wounded classified - American Troops only:

		Percent
(1) Number of wounded admitted: 5106		
(a) Serious	2010	39.3
(b) Slight	3096	60.7
Total	5106	100.0%
b. Classification of wounds:		
(1) Upper extremity	1702	25.7
(2) Lower extremity	2160	32.5
(3) Abdominal	362	5.5
(4) Chest	578	8.7
(5) Head and Neck:		
(a) Maxillo-facial	386	5.8
(b) Others	592	8.8
(6) Burns	115	1.7
(7) All others	741	11.3
Total	6636	100.0%
c. Deaths after admission to hospital:	255	
(1) All deaths were the result of wounds or injuries.		
(2) Secondary causes of death: Shock, hemorrhage, gas gangrene, and peritonitis.		
d. Patients showing infection in wounds:	169	
e. Statement as to the use of Sulfanilamide:		
(1) By mouth: Approximately 52% of patients had received sulfanilamide prior to admission.		
(2) In the wound: Approximately 90% of patients had received sulfanilamide in the wound.		
f. Patients receiving blood plasma:	954	
g. Number of patients receiving saline infusions:	1206	
h. Number of blood transfusions:	220	
i. Number of amputations:		
(1) Upper extremity:	32	
(2) Lower extremity:	27	
j. Number of psycho-neurotic cases as result of combat:	702	

The above figures are furnished for comparative purposes. Figures are incomplete, but are believed to be within 5% correct.

The following medical admissions were made during the period 10 July to 20 August, 1943, as reported by the unit weekly statistical reports:

a. American Troops:		
(1) Hospital Admissions:	20,734	
(2) Quarters Admissions:	20,828	
		41,562
b. Allied Troops:		
Hospital Admissions to U. S. Installations:		338
c. Enemy Troops:		
Hospital Admissions to U. S. Installations:		1,583
Total admissions		43,483

d. Classification of Admissions of U. S. Army Troops only:

(1) Disease:		
(a) Admitted to Hospital:	13,320	
(b) Admitted to Quarters:	14,635	
		27,955
(2) Injuries & Battle Casualties:		
(a) Admitted to Hospital: (This figure includes 5,106 wounded admitted to hospital)	7,414	
(b) Admitted to Quarters: (This figure also includes those who were wounded as result of enemy action but were not hospitalized)	6,193	
Total		13,607

The following dispositions were made during the period 10 July to 20 August inclusive:

a. Patients evacuated to North Africa: (Including Allied & Enemy)		
(1) By Air	5,967	
(2) By Water	5,391	
Total		11,358
b. Number of patients returned to duty from Hospitals in Sicily: (Includes Enemy to Stockade and Allies to Duty)		7,168

It is to be noted:

That the figures for admission to hospital and quarters did not include a large number of civilian casualties, who for humane reasons were treated. That in the initial phases all sick and wounded requiring hospitalization had to be evacuated to North Africa. That due to the rapid movement of troops, one or more medical units were necessarily closed in order to move to new sites. (That during the later phases, instructions were received from NATOUSA to hospitalize Malaria patients, who numbered several thousand, for two weeks). That there were no fixed hospital beds on the Island, and only one Evacuation Hospital (750 bed), which opened on D/33, to act as a Station Hospital.

Notwithstanding the factors enumerated above, all patients were disposed of in Sicily, excepting 11,358 who were evacuated to North Africa. This number includes Prisoner of War patients from Stockades and Italian Military Hospitals, not included in the figures shown in the admissions to Army medical installations.

(See Annex No. 5)

VI PRISONER OF WAR CASUALITIES

The Geneva Convention relating to Prisoner of War casualties was strictly adhered to in all respects. The Prisoner of War casualties in U. S. Army medical installations were treated and evacuated in the same manner as U. S. Troops. Those who could be returned to duty were sent to the Prisoner of War Stockades.

During the campaign, a number of Italian Military Hospitals, intact with their staffs and patients, were captured. Notwithstanding the large staffs, the excellent quality of the medical supplies and equipment available at these hospitals, the professional work of the Italian Medical Corps in many instances was inferior. Sanitation also was found to be very poor. However, under the supervision of the U. S. Army Medical Corps, a definite improvement was soon noted.

The patients, about 2,000, in Italian Military Hospitals scattered throughout the Island, were centralized in the two large Military Hospitals No. 1 and No. 3 in Palermo. The Italian Military Staffs cared for the patients in these institutions under the supervision of U. S. Army Medical Officers. Thus the prisoners remained among their customary surroundings and did not occupy beds in the U. S. Army medical installations.

During the later phase of the campaign, Sicilian Medical Officers and men were released to AMGOT to care for the civil population. Italian medical personnel, not needed for the Italian Military Hospitals and Prisoner of War Stockades, were evacuated to North Africa.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

Medical intelligence information, as well as captured medical equipment, drugs, biologicals, and specialized equipment, were forwarded to proper agencies in the War Department.

There were no epidemics or undue prevalence of communicable diseases among the large number of prisoners in the Prisoner of War Stockades, which often contained upwards of 30,000 prisoners.

VII PREVENTIVE MEDICINE

General: While in North Africa, prior to embarkation for Sicily, the various units were intensively indoctrinated with the vital necessity of rigidly upholding the highest sanitary standards and methods of avoiding diseases peculiar to this Island. Detailed inspections were made and correct procedures insisted upon. Particular stress was given to preventing access of flies to human feces, ingestion of only Army approved food (including milk) and water supplies, maintenance of adequate supplies for disease prevention, insect control, the regular use of atabrine suppressive malaria medication, and the giving and recording of immunizing inoculations. Many of the inoculations due in July were given in late June and early July.

Clothing and Quarters: Woolen clothing, with steel helmets and liners, and leggins, were worn and had no bad effect on health in spite of the intense heat and dust. With the rapid cooling off at night, the woolens proved desirable. Practically all the Command slept on blankets on the ground, with only a mosquito net (or additional shelter half) above. Bivouacs were changed rapidly. Buildings had to be disinfested and carefully cleaned before occupancy.

Insect Control: The chief problems arose in connection with mosquitoes, flies, sandflies, fleas, and bedbugs, with only a few lice encountered at this season. Two disinfestation platoons were planned for but did not arrive before hostilities ceased. They were not needed, however, since the hospital facilities and small improvised units served adequately. Bed nets, head nets, and gloves, repellents (with the white Skat-dimethyl phthalate - proving more effective and lasting than the yellow-indalone), and sprays (pyrethrum), were used to prevent mosquito bites during combat. Later, more lasting or breeding control methods were begun. The 20th Malarial Control Unit served efficiently in surveying, in control work, and in stimulating, and coordinating with, other agencies. The unit also proved invaluable in general insect control activities. There were enough pest mosquitoes to aid in bed net discipline against anophelines. Troops found flies waiting in hordes, even among the rather isolated huts and herds. Control measures used were as follows: Proper waste disposal, screening (wherever available), sprays and trapping. During the latter part of the campaign, the effects of sandflies became apparent. Except for the relative dryness, breeding places were ideal among ruins of bombed buildings of earthen construction. Bednets (sandfly mesh), sprays, and repellents proved helpful. Fleas and bedbugs were in practically all habitable buildings, and control measures were necessary, not only in occupied but also in the adjacent storage or waste rooms. Standard Army control methods proved adequate.

Waste Disposal: Standard Army Regulations and Instructions of FM 8-40 and 21-10 were more closely followed in this campaign than has usually been the case. Particular care was taken in disposal of human wastes in order that access of flies could be prevented. Solid kitchen wastes were buried or burned in most instances, and liquid wastes were run into soakage pits.

Water, Food, and Mess Sanitation: Water was brought ashore in quantities of one gallon for each man for five days. This arrived in Army five gallon cans. The Navy pumped ashore several thousand gallons from water storage tanks of LST's to Army Engineer canvas tanks placed on the beaches, leaving aboard only that actually needed on the return trip. The Engineer Corps then followed up the units, establishing points for distribution of chlorinated water from existing piped supplies, streams, and dug or drilled wells. As rapidly as possible, usual city supplies were re-established and that used for drinking by troops was chlorinated. The quantity and quality were satisfactory. Food consumed was C, K, Straight B, and B-5-1 (sometimes called U) rations, with hospitals getting the B-5-1, supplemented by one hot drink or soup for each meal, whenever the specially packed hospital supplement was not available. Whenever possible, the C rations were warmed, but with rapid movement of many units, this was not possible. With no refrigerated trucks or railway cars, available fresh meat had to be consumed the same day it arrived. Distribution operated smoothly, and the diet appeared adequate in all but a few isolated instances, such as when for a few days a Ranger Battalion had to depend on pack-donkey transportation. The hazards were decreased since most food was eaten from the original containers. Until adequate precautions could be instituted, very little locally acquired foodstuffs were used.

Immunizations and Atabrine Suppressive Medication:

All military personnel of this Command were immunized in accordance with MATOUSA Circular 21 (28 Feb. 1943) and changes of Circular 59 (13 April 1943). Inoculations were given against smallpox, typhoid, para-typhoid, typhus, and tetanus. For the suppression of malaria symptoms, atabrine was distributed with rations and taken from 22 April four days weekly (0.1 gram dosage), following a full meal. Quinine (2/3 gram) was taken daily by those sensitive to atabrine and all flying personnel. A few landing ships failed to provide atabrine with rations, and a few small units were without atabrine for three or four days at a time. On 12 August 1943, atabrine was ordered taken seven times a week for three weeks to further build up the concentration. Prior to this dosage, increased symptoms of malaria were precipitated by the following: change of station, upper respiratory inflammation due to exposure and dust, injuries, sandfly (and perhaps other dengue-like) fevers, and intestinal disturbances. The cases classified as "PUO" (Fever of unclassified origin), were largely malaria and/or sandfly fever. A considerable percentage of upper respiratory infections were probably precipitated by dust irritation.

VIII MEDICAL SUPPLY

Medical supplies were ample. Approximately 110 deadweight tons were landed on the beaches between D-Day and D+2. There was a 10% shipping loss of medical supplies due to enemy action.

Following the assault and follow-up shipments, convoys UGS-11 and UGS-12 arrived with medical supplies. These and initial shipments were supplemented from time to time with emergency requisitions of critical items, which were shipped from North Africa by water and air transport, depending upon the urgency of the request and the bulkiness of shipment. The first such request was for litters, to replace those lost due to lack of property exchange with Hospital Ships and Air Transports during the first week. Additional cots were requested to make possible the expansion of hospitals in Sicily.

In unpacking supplies during the early stages, it was found that a large number of boxes were only 50% filled, and stuffed with straw. Packing lists were inaccurate, 20% of the packing lists attached to the boxes did not agree with the contents.

When supplies from the UGS convoys started to arrive, a large percentage of breakage of bottles was found. The Medical Department Chests were incomplete and invariably were short the same critical items which could not be replaced from depot stocks in Sicily.

Generally, Medical Maintenance Units were satisfactory, but contained too much Cotton in proportion to other articles, and did not contain enough Tincture Opium Camphorated, Plaster of Paris Bandage, and Crinolin. The Medical Maintenance Units also contained too much "seasonal" stock which could not be used at the time of year this operation took place.

The supply points or depots were operated by two Advanced Sections of a Medical Supply Platoon. They received all medical supplies unloaded in Sicily, segregated, inventoried, and moved them to the forward areas where they were urgently needed.

After the action progressed, advanced details from these sections established supply points with approximately 15 to 20 tons of balanced medical supplies as near the combat troops as the tactical situation permitted.

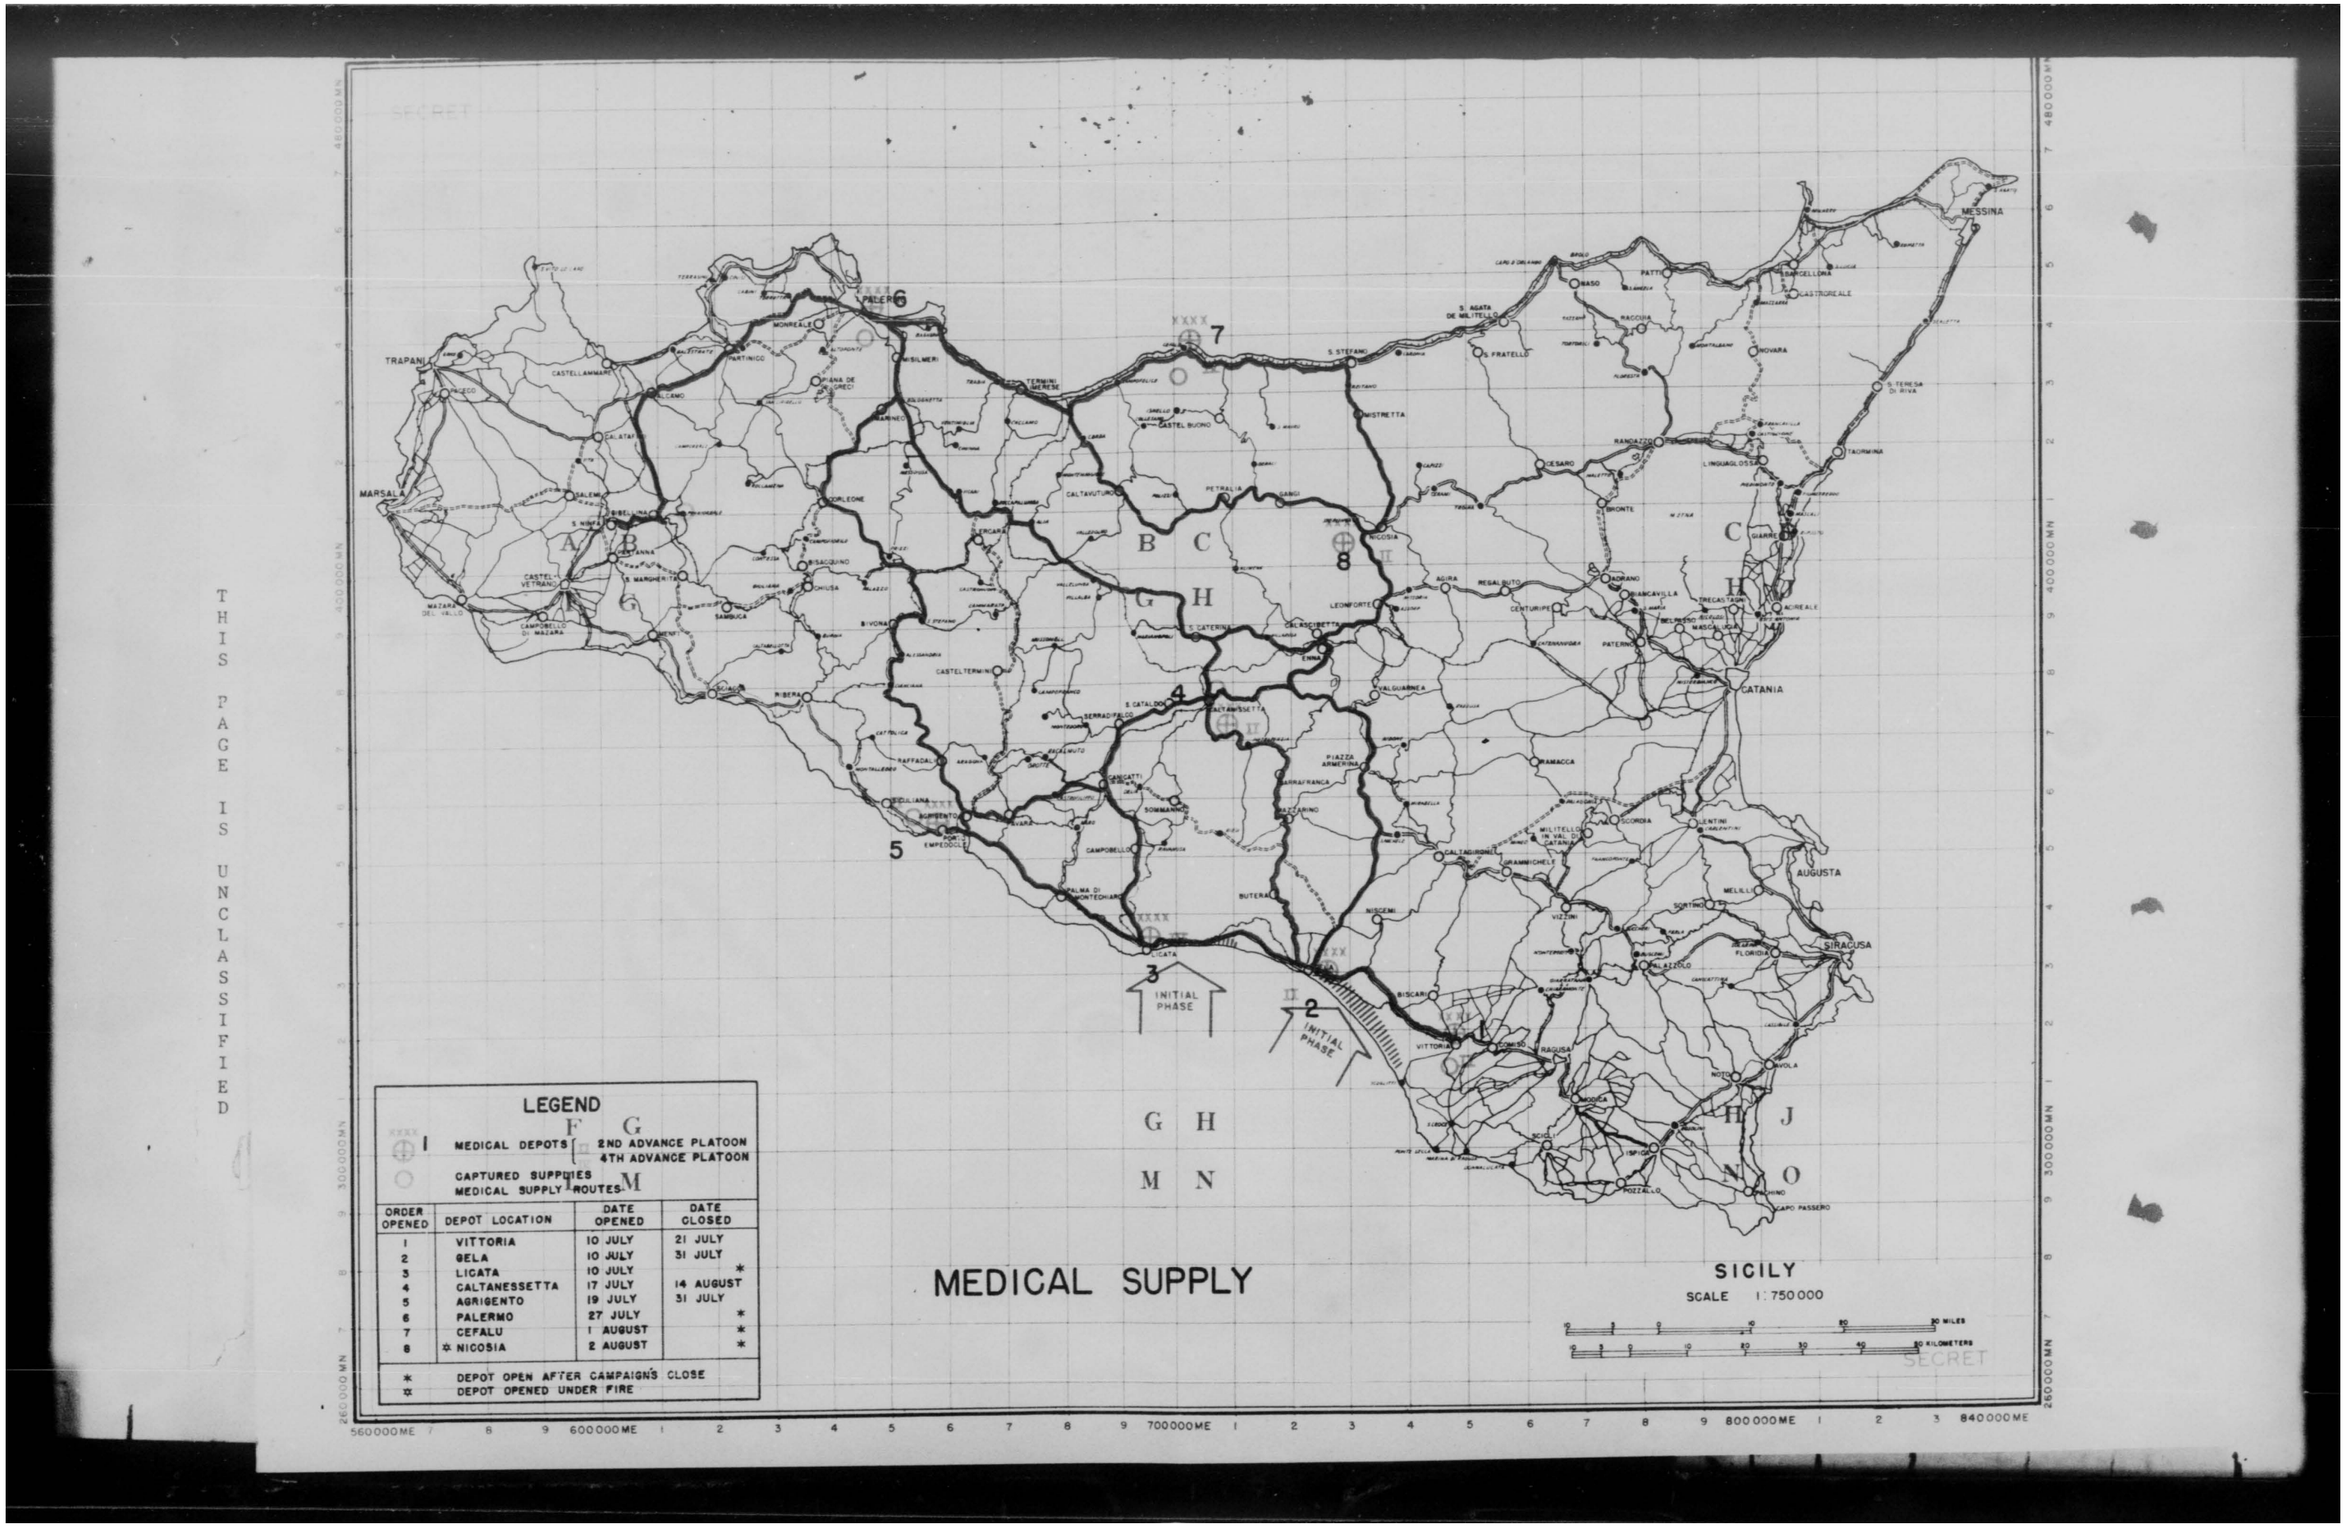
During the course of the campaign, several Italian Medical Supply Dumps and Military Hospitals were captured. Some of the equipment found in these medical installations was issued to U. S. Army medical units, the remainder of supplies and equipment was turned over to AMGOT for civilian purposes. (See attached map showing location of medical supply depots and dumps).

IX CONCLUSIONS

1. That the Medical Service for this operation was successfully and efficiently rendered.
2. That there was lack of coordination in the transportation section permitting separation of hospital personnel from their equipment.
3. That the Corps Type Medical Battalion, as provisionally reorganized, having three Collecting-Clearing Companies in addition to the Headquarters, proved to be more efficient.
4. That all possible means of evacuation should be utilized to the maximum.
5. That air evacuation is the best method of moving casualties to rear areas.
6. That hospital carriers equipped with water ambulances are far superior to any other method of water evacuation from beaches.
7. That the professional work done in the hospitals was skillful and of high order, especially the splendid work done by the experienced surgical teams attached to forward medical installations (Field Hospitals).
8. That Prisoner of War casualties in captured military hospitals should remain there under supervision of U. S. Medical Corps.
9. That civilian casualties, for humane reasons, should be given first-aid but not to be admitted to military hospitals if civilian facilities are at all available.
10. That the medical supply distribution points should be located as far forward as the tactical situation permits. Captured medical supplies should be utilized to the fullest extent.
11. That the superior medical care received by casualties during this campaign was due to the untiring devotion to duty of the entire Medical Department and the splendid cooperation rendered by the Service Sections of this Headquarters, especially the Engineer and Quartermaster Sections.

X RECOMMENDATIONS

After careful study of the role played by the Medical Department in the Operation "HUSKY", the following recommendations are submitted:



1. That the Medical Plan as prepared should be issued in the form of a directive rather than a recommendation, thus preventing alterations of the plan which might seriously handicap the medical service rendered to the Operation as a whole.
2. That medical personnel, their equipment, and vehicles, should be loaded, in so far as possible, on the same ship. Under no circumstances should the personnel and equipment be shipped on separate convoys.
3. Medical units landing during the Assault Phase should be combat loaded.
4. That each medical installation have a plan for loading the minimum of personnel, equipment, and vehicles, as a Unit necessary for efficient operation in the event that shipping space is not available for the entire organization.
5. That the semi-mobile Evacuation Hospitals (400 beds) should arrive complete with personnel and equipment on D+3 or D+4, and in a proportion of one hospital to each Division. The larger Evacuation Hospitals (750 beds) should land not later than D+14 in the proportion of one to two semi-mobile Evacuation Hospitals (400 beds).
6. That the Corps Type Medical Battalion be reorganized into a Battalion Headquarters and three Collecting-Clearing Companies.
7. That in all future operations, the Field Hospital should be augmented by Surgical Teams, unless the Table of Organization is changed to provide for an increase in the number of well trained and specialized surgeons.
8. That the Army Surgeon be given authority to coordinate directly with the Navy for movement of Hospital Ships and Carriers.
9. That all Hospital Ships be equipped with water ambulances similar to those on the Hospital Carriers, if they are utilized to evacuate from beaches.
10. That Air Evacuation is the method of choice and should be utilized to the maximum.
11. That every effort should be made to establish landing fields for air evacuation as close to the combat troops as the tactical situation permits.
12. That Planes with slow landing speed, or Helicopters, should be available to evacuate casualties from isolated areas inaccessible to motor transport.
13. That a similar type plane be available at all times to the Army Surgeon in order to maintain constant liaison with the widely scattered medical units.
14. That medical supply personnel should land on early priority to assure that medical supplies landed on the beaches are quickly collected, stored, and made ready for issue.

DANIEL FRANKLIN
Colonel, M.C.
Surgeon

3 PROVISIONAL CHANGE IN CORPS MEDICAL BN.

In order to provide a more efficiently operating Corps Medical Battalion for this type of Invasion Operation, a plan was evolved for forming a third "Provisional" Clearing Platoon by utilizing the Station Section and Litter-bearer Section of the Collecting Company as follows:

Number 1 Collecting-Clearing Unit

a. Clearing Unit
Hq. Section Company D - 11 E.M. - 1 MC
1st Platoon Company D - 53 E.M. - 4 MC & 1 Dental
Litter Bearer Section Co C - 41 E.M. -
Total 105 E.M. 6 Officers

b. Collecting Unit
Hq. Section Company C - 11 E.M. - 1 MC
Ambulance Section Company C - 28 E.M. - 1 MAC
39 E.M. 2 Officers

Number 2 Collecting-Clearing Unit

a. Clearing Unit
Hq. Section Company D - 11 E.M. - 1 MC
2nd Platoon Company D - 53 E.M. - 4 MC & 1 Dental
Litter Bearer Section Company B - 41 E.M. -
Total 105 E.M. 6 Officers

b. Collecting Unit
Hq. Section Company B - 11 E.M. - 1 MC
Ambulance Section Company B - 28 E.M. - 1 MAC
Total 39 E.M. 2 Officers

Number 3 Collecting-Clearing Unit

a. Clearing Unit
Hq. Section Company A - 17 E.M. - 1 MC
Provisional Platoon (Clearing) composed of Station Sections of Companies A, B, & C. - - 2 MC Co A
- 3 MC Co B
- 45 E.M. - 3 MC Co C
Hq. Sections Co's B & C - 12 E.M.
Litter Bearer Section Co A - 41 E.M.
Total 115 E.M. 9 Officers

b. Collecting Unit
Ambulance Section Company A - 28 E.M. - 1 MAC

This regrouping was then tested in field exercises under simulated combat conditions. After careful study and observation, it was readily evident that the proposed change materially increased the efficiency and mobility of the Medical Battalion.

Such reorganization made necessary the acquiring of a minimum amount of additional equipment over and above that in Table of Basic Allowances No. 8. This included the following:

Ward Tents	- 5
Basic Surgical Instrument Set	- 1
Generator	- 1
Sphygmomanometer	- 1
Lamp, Operating	- 1
Lab Chest	- 1
Chest, Mess Ware, Patients	- 1
Litters	- 100
Blanket cases with blankets	- 4

SECRET

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

The transportation necessary for this organization under the new plan was satisfactorily fulfilled under Table of Organization 8-65, dated 2 April 1942.

This Medical Battalion, operating with three Collecting-Clearing Units throughout the Sicilian Campaign, admitted 5,581 patients. It was the opinion of the Officers that they were able to give more efficient and quicker service to the troops because of the fact that each of the three collecting-clearing units could operate independently and be assigned separate missions. By forming such units, medical officers in the collecting companies were utilized to the fullest capacity, which was not true in the old type Corps Medical Battalion.

The morale and efficiency of the officers and enlisted men involved in these changes were definitely improved. They were being used in their professional and technical capacities for the first time since their entrance into the Collecting Companies.

The following is a proposed new Table of Organization for a Collecting-Clearing Company of which there would be three identical companies in the battalion:

COMPANY HEADQUARTERS

1.	First Sergeant	
2.	Company Clerk	- T/5
3.	Company Carpenter	- T/4
4.	Pharmacist	- T/4
5.	Laboratory Technician	- T/5
6.	Bugler	- Pfc
7.	Orderly	- Pvt
8.	Mail Orderly	- T/5

ADMISSIONS & EVACUATIONS

1.	Sergeant	
2.	Clerk	- T/5
3.	Clerk	- T/5
4.	Clerk	- Pfc
5.	Clerk	- Pfc
6.	Clerk	- Pfc
7.	Clerk	- Pfc

SURGERY

1.	S/Sergeant	-

FOREWORD

The History of the Adjutant General's Section during the Operation HUSKY will be found to deal to a great extent with the Casualty Section, Machine Records Units and Postal Service. These were the sections most effected and are necessarily dealt with at some length. The Miscellaneous and Personnel Sections handled a huge increase in volume, but the systems normally employed were found adequate and no major changes desirable. The organization of Headquarters Seventh Army was based upon Headquarters I Armored Corps, this unit being expanded and redesignated. The chart attached and marked Annex Y indicates the organization adopted. During two amphibious operations completed by the Seventh Army, the sub-divisions as indicated were found the best adaptable to the tactical organization and its requirements.

1B - ADMISSION & DISPOSITION REPORT - SECTION I
1C - ADMISSION & DISPOSITION REPORT - SECTION II

I. PLANNING STAGE

1. General. The planning for the HUSKY (Sicilian) Operation within the Adjutant General's Section was of necessity vested within a small planning group termed "BIGOT - HUSKY". This allowed the three divisions of the Adjutant General's Section, Miscellaneous, Personnel, and Operations, to pursue their normal functions with the exceptions shown below.

2. Mail and Records during Planning Stage. During the early days of the planning stage of Operation HUSKY, it was necessary to set up a separate Classified Section to handle all papers dealing with the operation. This section consisted of one officer and three enlisted men of the Adjutant General's Section. Because of the requirements for utmost secrecy, it was necessary to treat all documents as registered. All incoming documents and all documents originating in the headquarters were registered and were thereafter referred to by the registry identification. The advantage of this method was that documents could be referred to in receipts, correspondence, radiograms, and telephone conversations by code registry number, rather than by subject matter, thereby affording an added measure of security and avoiding the necessity of classifying receipts. This provided a complete record of all copies showing the number and location of each copy. The system worked so efficiently that not once during the planning of the operation was any document compromised through loss or misplacement. This system was retained in effect until D-Day when the records were transferred to the Adjutant General's regular Classified Section.

3. Personnel Administrative Plan.

a. In the light of experience gained in Operation TORCH, it was apparent that a personnel administrative plan based upon and coordinated with the tactical plan was essential. Consequently a planning group consisting of three officers of the Adjutant General's Section, who by previous experience were familiar with the Operation TORCH, prepared an Administrative Plan including the following main considerations:

(1) That each sub-task force be based upon a major administrative unit.

(2) That the casualty situation was by far the largest problem to be faced.

(3) That schools for administrative personnel were necessary prior to commitment to the operation.

b. The plan in the form of a directive was issued to the troops as follows:

(1) Purpose: To secure prompt and accurate reports and returns from forward areas, and to keep tactical commanders informed as to casualties and replacements.

(2) Responsibility of Sub-Task Force Commanders: To efficiently administer all assigned and attached troops and attain the following objectives:

(a) Prompt and accurate reports of battle casualties to army headquarters.

(b) Prompt and accurate Personnel (G-1) Reports, including battlefield promotions and awards and decorations.

(c) Maintenance of personnel statistics for the use of tactical commanders.

(3) Morning Report:

(a) The Morning Report, W.D., A.G.O. Form 1, was the basic document from which the above information was obtained. Each unit engaged in the operation sent daily to the Administrative Control Section (see below) by the most expeditious means an extract of morning report. Units still on the mainland forwarded the extract directly to the Personnel Administration Center (see below).

(b) An efficient control on the submission and disposition of extracts was maintained by (1) Administrative Control Sections and (2) Personnel Administration Centers.

(4) Administrative Control Section:

(a) This section was set up in the forward echelon of each sub-task force and controlled the submission and disposition of extracts of morning reports. It maintained statistics on battle casualties and replacements.

(b) Composition: One or more officers and sufficient clerical personnel who were familiar with morning report control and compilation of statistics to insure the smooth functioning of the section.

(c) Function: Extract copies of morning reports were submitted daily to this section by all units. An M.R.U. machine prepared card index of all sub-task force personnel engaged in the operation was maintained in the Administrative Control Section of each sub-task force. Accuracy required that it be correct as of "H" Hour. Separation by units was effected and individual cards showed full name, grade, army serial number, and the military occupational specialty for enlisted men. Duty code was shown in the case of officers. When extract copies of morning reports were received reflecting casualties or other non-effectives, cards were withdrawn from the file of "effectives" and refiled in the "Casualty File". The Casualty File was sub-divided into categories by guide cards as follows:

1. Killed in Action
2. Seriously Wounded in Action
3. Slightly Wounded in Action
4. Missing in Action
5. Captured by Enemy
6. Died of Wounds
7. Interned
8. Non-Effectives - Other Causes.

Cards of personnel evacuated or died as a result of normal sickness or injury were placed in the last category. Statistical information from this file was used to furnish the command group with pertinent information regarding non-effectives from all causes.

(5) Personnel Administration Centers:

(a) These centers were established in the rear echelon of the DIME-CENT, JOSS and KOOL Sub-Task Forces. All personnel administration for assigned and attached units was handled in this center.

(b) Composition: Personnel Officers and clerks from the Regimental and Battalion Unit Personnel Sections, operating under direct jurisdiction of the Adjutants General of sub-task forces, composed this center.

(c) Functions: Extract copies of morning reports received from the Administrative Control Section were routed by the Adjutants General to the Personnel Officers concerned. Morning reports were prepared and authenticated by the Personnel Officer from information shown in the extracts. Battle Casualty Reports (WATOUSA Form 6) were prepared from completed morning reports by the company, battery, detachment, and similar organization clerks. Personnel Officers insured that all entries contained in Battle Casualty Reports agreed with the information contained in the Service Record, Classification Card, and any other pertinent records.

(6) General: Certain elements of the sub-task forces were committed without administrative personnel. Detachments such as this were attached to some organization for administration. Changes in status of personnel in this category were then reported on the Morning Report of the organization to which attached. Sub-Task Force Commanders were responsible that the attachments were effected. Rosters and index cards necessary were then furnished by the Machine Records Unit servicing the organization on call from the Sub-Task Force Commanders.

4. Administrative Planning Schools.

a. Administrative Planning Schools were conducted by the Adjutant General's Section, Seventh Army (then I Armored Corps, Reinf.), in accordance with the following general plan:

(1) PURPOSE: To review the necessary administrative functions for an operation and to coordinate administrative agency requirements for all echelons, and special emphasis on casualty reports.

(2) ATTENDANCE:

(a) From Corps Administrative Control Section: Administrative Control Section Officer and one enlisted man.

(b) From each Division Administrative Control Section: Administrative Control Officer and one enlisted man.

(c) From each Regiment, Separate Battalion and separate Company within Divisions: Personnel Officer and Personnel Sergeant Major.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

(4) From each Separate Regiment, Battalion or similar unit: Personnel Officer and Personnel Sergeant Major.

(3) SCHEDULE:

(a) First Day
0800-0810 - Welcome by Commanding General.
0810-0850 - Opening Lecture - Necessity for a Personnel Administrative Plan for an operation.
0900-0930 - Function and operation of Administrative Control Section (Assault Groups).
1000-1150 - Function of Machine Records in the Administrative Plan.
1300-1350 - Function and Operation of Personnel Administrative Center.
1400-1450 - The Revised Morning Report.
1500-1650 - Compilation of Statistics and Maintenance of Records of Casualties.
1700-1730 - Inspecting M.R.U. in actual operation.

Second Day
0800-0850 - Disposition of Effects of Deceased.
0900-0950 - Army Postal Service previous to and during an operation.
1000-1050 - G-1 Reports.
1100-1150 - Personnel Replacement Procedure.
1300-1650 - Preparation of Battle Casualty Reports.
1700-1730 - Inspecting M.R.U. in actual operation.

Third Day
0800-0850 - Graves Registration.
0900-0950 - Preparation of Revised Morning Report.
1000-1150 - Closing of Records of Casualties.
1300-1325 - Decorations.
1330-1355 - Promotions (Battlefield Especially)
1400-1450 - Prisoner of War Reports - Processing of Prisoners.
1500-1550 - Final Discussion and Question Period.
1600-1615 - Closing Remarks.
1700-1730 - Inspecting of M.R.U. in actual operation.

(b) Due to the wide geographical separation of units composing the force, a total of four separate schools were conducted at different times, utilizing the same instructors.

5. Postal.

a. The 11th Postal Regulating Station and Army Postal Units 547, 548, 549, 550, and 778 were assigned to Seventh Army by NATOUSA after July 1, 1943, to assist the Divisional and Corps APO's in the regulation of the mail.

b. The 11th Postal Regulating Station acted as the base post office for the operation prior to and subsequent to D-Day.

c. On July 1, 1943, all Base Post Offices in Africa were instructed to hold all newspapers, magazines, and parcel post mail until postal facilities could be set up in Sicily. Letter mail was delivered to units while in the staging areas by normal Army Postal Service.

6. Machine Records Unit.

a. During March 1943, while Headquarters I Armored Corps was at Rabat, French Morocco, it became apparent machine records was to play a vital part in planning the Operation HUSKY. A coordinated foundation had been built with NATOUSA which had standardized all Theater Machine Records Procedure for station, special parent unit and higher echelon coding, and for procurement of W.D., A.G.O. cards and forms, parts, accessories and personnel. In addition, dates and methods of preparation of reports for the War Department, NATOUSA and Inter-Machine Records Units Procedure had been systematized.

b. Special Reports in the Planning Stage. To more effectively render reports during the planning stage, the Machine Records Unit was kept with the forward (planning) echelon of Headquarters Seventh Army. At this time one of the most important reports was an Organizational Listing of all Nominated Units of the Force indicating station, assignment, attachment and strength. Master Organization Cards from all Machine Records Units in the North African Theater were consolidated weekly to prepare this report which gave the General and Special Staff Section of the Force information needed to plan movement of Units to and from training and embarkation points, to figure replacements and to effect communications. The report was also rerun grouped by arm of service so that proper distribution of troops of the various branches could be studied. As the tactical situation crystalized, the above reports were broken down by sub-task forces and G-4 was furnished a report by station for logistical purposes. Figures were furnished G-1 which gave totals of the sub-task forces including those units attached to base sections, and also figures minus the attached units. Thus combat strength was shown. G-1 also received daily figures on replacements, weekly gains and loss figures by organization, a daily strength return, and a weekly absent report showing personnel not available for duty, such as sick, evacuated, and not evacuated, wounded, etc.

c. In addition to the above special reports, the following routine operations were carried on:

(1) Monthly officers' rosters were prepared and forwarded to the War Department through NATOUSA.

(2) Monthly Strength Cards, W.D., A.G.O. Form 320, were cut and forwarded to the War Department through NATOUSA.

(3) Rosters of enlisted men were produced for the units assigned to I Armored Corps, Reinforced, at least once every 60 days.

(4) Locator Cards were prepared and distributed every 24 hours.

(5) Staff section rosters were prepared for various Headquarters as needed.

(6) Strength returns and station lists for the I Armored Corps, Reinforced, as differentiated from the force, were prepared weekly and distributed to the General and Special Staff Sections, Base Sections and NATOUSA.

II. MOVEMENT BY WATER

1. The Task Force (Seventh Army) Administrative Control group arrived at Sicily on D-Day with the Commander and his staff. On D plus four, the Adjutant General, his executive officer, chief clerk and two clerks moved to the combat zone to establish a small working group in preparation of the remainder of the AG Section. A beachhead having been established the MPU and Casualty Section, which should never be separated, were called for and arrived at D plus eight.

2. Postal.

a. Divisional and Corps APO's moved with the Divisions. APO 45 which came direct from the United States landed in Sicily on D-Day, but other APO's arrived from seven to ten days later. Seventh Army APO and the 11th Postal Regulating Station were scheduled to move on D plus 4, but changes in the troop priority list did not allow them to leave Biserte until D plus 10.

b. The units disembarked from LST's at Port Empedocle on July 24. There were no beach operations. Each APO brought as much mail as possible with their organizational equipment.

III. BEACH OPERATIONS

1. A definite plan of reporting casualties evacuated was adopted whereby all medical battalions and other medical installations designated for beach operations, Naval Medical Officers concerned with evacuation, Hospital Ships' Surgeons, and Divisional Clearing Stations were directed to prepare and submit a daily Admission and Disposition Report, (See Annex 1-B and Annex 1-C) all casualties. Thus casualties were accounted for on each medical installation's Disposition Report which showed the exact disposition made of the casualty, i.e., to named medical installations, from the beaches on named or numbered craft, and to named Hospital Ships or North African Ports. This plan was coordinated with the Army Surgeon and Naval authorities. This procedure enabled this headquarters to keep units advised of casualties occuring in their organizations and the dispositions made, thereby obviating the submission of reports of "Missing in Action" and securing reports of the correct status in an expeditious manner. The establishment of this system of effecting an accurate accounting of evacuees by name and diagnosis was a definite factor in preventing the normally high ratio of missing in action being reported on Battle Casualty Reports, and was secured through the cooperation and close coordination of all agencies involved.

IV. LAND OPERATIONS - SICILY

1. All personnel administration was carried on in the rear echelon. During the active period of operations, this consisted principally of battlefield promotions, replacements, and casualty reports. These latter two functions were closely related and by far the most important personnel functions. The casualty section which operated in the personnel division of the Adjutant General's Section consisted of one officer, one warrant officer and four enlisted men. For the first seven days of the campaign, this section operated from Biserte. Together with the 20th Machine Records Unit, it embarked for Sicily on the D plus 8 convoy and from then on operated from various locations in Sicily.

2. Reports of casualties from Corps and Division Headquarters and from Army troops were processed through this section. Each individual case was carded and kept in an alphabetical file. Weekly Wounded Progress Reports from hospitals, daily Admission and Disposition Reports from all medical installations under Army control, reports of evacuations from the U. S. Navy, and daily reports of burial control, reports of evacuations from the U. S. Navy, and daily reports of burial from the Graves Registration Service likewise were received. All information concerning a given individual was carded. Any information additional to or at variance with an organization's report was furnished the unit in order that it might keep an up-to-date record of the status of their personnel. In this way, many individuals reported missing in action were located, that otherwise would have been carried in this status for months.

3. Three Machine Records Units were available for the processing of Casualty Reports, one attached to II Corps, Reinforced, one to the 3d Infantry Division, Reinforced, and the third to the Seventh Army, which serviced the reserve Divisions and Army troops as well as acting as a Consolidating Unit. The first consideration dealing with casualties was the forwarding of accurate reports to the War Department through the Army and Theater Headquarters, and second, the compiling of statistical information to serve as a guide in future operations. The basic source record is the Battle Casualty Report, NATOUSA Form 6. To accomplish this the following procedure was adopted:

a. Battle Casualty Reports were prepared by the Unit Personnel Sections and forwarded in the cases of II Corps and 3d Infantry Division to their respective Headquarters, where they were assigned a control number and then forwarded on a 24 hour basis to the Machine Records Unit servicing the Corps or Reinforced Division. There the Status Card was pulled, Machine Prepared Battle Casualty Cards produced and one copy forwarded with the Battle Casualty Report to the Battle Casualty Section of Seventh Army. In the case of Army troops, the Battle Casualty Reports were forwarded direct and controlled by the Seventh Army Casualty Section.

b. Despite a considerable number of Tunisia casualties, whose cases had not been closed, and the necessity of carrying on considerable correspondence to correct current errors, the Casualty Section was able to process 800 to 1000 casualties per day and forward to the Army Machine Records Unit.

c. When units were released from the line and during lulls in combat, Unit Personnel Sections forwarded Service Records and allied papers of casualties. During the period of actual combat operations, several hundred sets of records were processed through the Casualty Section.

d. All records were checked against the Casualty File, those bearing discrepancies being returned for corrections.

e. From 10 July to 18 August when the period of active operation in Sicily had ceased, 4395 casualties, over 50% of the total of the entire campaign, has been processed thru the Casualty Section and dispatched to NATOUSA.

f. The Seventh Army Machine Records Unit, upon receipt of the Battle Casualty Reports with the accompanying Status and Battle Casualty Cards prepared the additional cards for NATOUSA and for its own retained file. The Machine Records unit cleared its file and forwarded all reports every 24 hours to Algiers.

g. Daily Casualty Listings were prepared showing individual casualties by Unit and another listing showing the same information arranged by Type of Casualty.

h. Every 24 hours a Summary was prepared showing cumulative totals for the Campaign, broken down as to Officers, Warrant Officers, Nurses, and Enlisted Men by Type of Casualty. A weekly Consolidated Listing was run alphabetically and a Supplementary Listing alphabetically by Organization.

i. A Supplemental Work Card was prepared and retained in the files of the Army Machine Records Unit from which Arm or Service Reports and other long range planning data was furnished to provide information as to the proportionate type of replacements which should be held in readiness for any future operations.

4. Postal. Mail arrived at Licata by LST's from Africa within a short time after the Postal Units arrived and this mail was immediately delivered to the troops in the field and the Divisional APO's. Letter mail was first delivered to combat troops at D plus 10. The 11th Postal Regulating Station and APO 758 moved to Palermo from Southern Sicily with the rear echelon of the Seventh Army Headquarters. These units were set up to operate as a Base Post Office. All incoming mail was handled and regulated by the 11th Postal Regulating Station. APO 758 prepared all outgoing mail for dispatch to Africa. The facilities of the main civilian post office at Palermo were made available to the Army Postal Service, furnishing excellent equipment for handling mail. Within twenty four hours after being received at Palermo from Africa, the mail was delivered to the Divisional and Corps APO's, ready for distribution to units. Separate units called at the Divisional and Corps APO's for their mail. The 547th Army Postal Unit was attached to II Corps and placed in operation at Gangi to regulate the mail to the combat Divisions. The 548th Army Postal Unit was placed in operation at Licata to handle the mail

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

for troops in the southern part of the Island. Transportation of the mail to these units was furnished by separate trucking companies. After the campaign closed, the Divisions and Corps were withdrawn to the western part of the Island and they were able to furnish their own transportation to transport the mail to and from the base of postal operations at Palermo. During the entire campaign all outgoing letter mail was sent to Africa by air, and a large amount received by air. All mail was dispatched to Africa where Base Censorship was given. A base Censor was established in Palermo on D plus 60.

V. FINAL PHASE

1. With the close of the campaign, the "clean-up" of casualties proceeded rapidly. Through the check system in use, many reported previously as missing in action were located and reported to their organization. Within ten days after the close of the campaign, 7,666 casualties had been reported. This approximated 95% of all casualties suffered.

VI. CONCLUSION

1. The plans for handling casualty reports during the Sicilian Campaign were designed to insure prompt and accurate reports of casualties under battle conditions. Absolute compliance with instructions issued by this Headquarters should have resulted in only one item of unfinished business, i.e., "Missing in Action".

2. a. Considerable confusion resulted by the attempt to compare figures in the G-1 reports with actual casualty figures. An analysis of these two reports will indicate the fallacy:

G-1 Reports

* * * * *

(a) Killed:
(b) Sick, gassed and wounded:

(1) Evacuated:
(2) Not evacuated:

(c) Captured:
(d) Missing:

* * * * *

Battle Casualty Reports (AG)

(a) Killed

(b) Captured

(c) Wounded

(d) Missing in Action

b. Sub-paragraphs a should eventually check, one against the other, not however at once. The G-1 Report is intended to convey to the Commander the effective strength of his troops and cannot await an accurate check. Battle Casualty Reports are an accurate personnel accounting and accuracy rather than speed is a factor. Positive check is necessary before report is made.

c. The next times ((b) in the G-1 Report and (c) in the Battle Casualty Report) cannot be compared. The G-1 Report in conveying to the Commander the effective strength of his troops includes in this item all ailments which render a man incapacitated for duty: wounds, results of gas, sickness other than results of enemy action. It also indicates those evacuated and those not evacuated. This is necessary to the Commander in formulating future plans but is not, and is not intended to be, accurate personnel accounting. The Battle Casualty Report on the other hand reports those men wounded through action of the enemy and is an accurate personnel accounting. These two figures will never be remotely alike.

d. Item (c) in the G-1 report and item (b) in the Battle Casualty Report should eventually check. The comments under (b) above are equally applicable to this item. As reports are received through the International Red Cross, this item will increase and missing in action will decrease.

e. It is difficult to see how item (d) in both reports can ever be compared. In the case of the G-1 Report it is an immediate report soon after or while in battle and includes many afterwards found to be dead, wounded or captured. The figure in the Battle Casualty Report represents the result of a careful check of all sources of information and a resulting failure to locate the individual.

f. Daily G-1 Reports should never be totaled with the idea that the result will reflect an accurate battle casualty status.

3. The success in the battle casualty reports during the operation can be attributed to the following:

a. Education of troops in Battle Casualty Report procedure.

b. Close liaison between army and navy to insure that evacuated casualties were reported to army authorities.

c. The requirement that any type of report which will assist in locating and reporting casualties be prepared through which units concerned may be advised of casualties occurring in their organizations. Typical "check" sources are:

(1) Admission and Disposition Reports from all medical installations.

(2) Straggler reports from Provost Marshal.

(3) Graves Registration Reports of Burial.

(4) Navy Reports of evacuations.

(5) Chaplains' reports of burials at which they officiated.

(6) Wounded Progress Reports from hospitals.

4. Although not previously mentioned in this report, a source of much misinformation is unauthorized data on casualties which reaches the United States through personal mail. This is borne out by the constant stream of inquiries directed to the Theatre Commander by the War Department based upon letters received from relatives of soldiers. Unit and other censors, and especially hospital censors must be ever on the alert to delete from personal correspondence this information which not only embarasses the War Department but directly affects civilian morale.

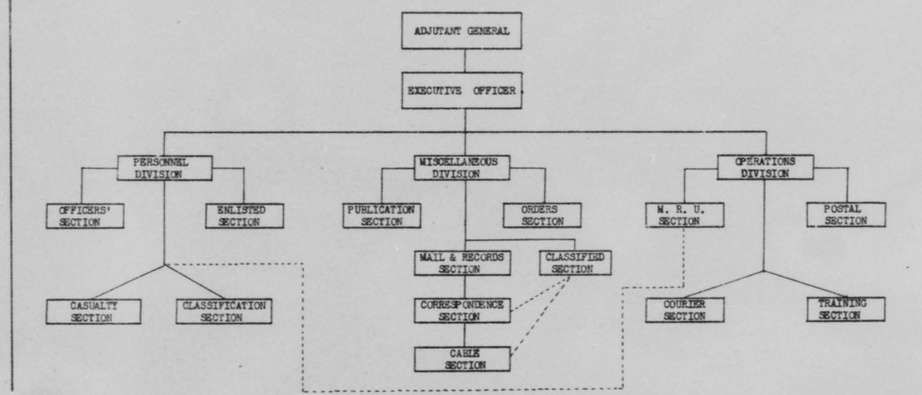
5. The uses for Machine Records Units increases as the organization being serviced approaches and engages in combat. Regular reports take on an added significance and enjoyed a wider demand. Special reports to fit constantly and rapidly changing needs are vital to the tactical commander. These two types of reports can be more quickly, efficiently and more accurately prepared by Machine Records Units than by any other means now known.

VII. RECOMMENDATIONS

1. The system employed was well adapted to the situation and should be used as a basis for future operations. Commanders, however, should realize their responsibility for administration and should not leave this wholly to personnel detailed specifically for administrative duties. In one unit where it is known that the Commander took close cognizance of this phase, the results are outstanding:

2. Censorship requirements, particularly as they pertain to information on casualties, must be more strictly enforced by everyone.

3. All administrative personnel of a TASK FORCE should be assembled in schools prior to an operation and thoroughly instructed in the administrative plan for the campaign.



4. The Machine Records Unit should be thoroughly understood and utilized to its fullest capacity, both to spare personnel in combat and to derive the maximum administrative benefit of accurate machine prepared reports.

REPORT OF THE QUARTERMASTER

I. FOREWORD

Food to give the soldier strength to fight; equipment to make him an efficient fighter; clothing and shelter to protect the soldier's health in order to keep him fighting; fuel for the vehicles that get the soldier to the place where he is needed to fight; fuel for the vehicles that keep him supplied; -all this, plus the task of keeping the soldier as comfortable as possible, to bolster his morale and make him a better fighter, was the mission of the Army Quartermaster in the Sicilian campaign.

II. PLANNING AND MOVEMENT PHASES

Planning of the Quartermaster element of the Husky Operation up to D - Day fell naturally into three parts enumerated as follows:

1. Determination of Quartermaster Troops to be engaged in the operation, their assignment and/or attachment, and their equipping and training.

2. Determination of the over all supply needs of the force as a whole for mounting the operation initially, and for subsequent maintenance.

3. Proper apportionment of the over all pool of supplies to the various elements and phases of the operation. This was one of the most complex problems ever encountered.

The above three sub-divisions of the planning activities is discussed in detail below:

TROOPS

The first step in the entire planning scheme was a determination of a Troop List. In order to make any sensible demand for Quartermaster Service troops to support the operation, final information of the total strength and composition of the force was essential. When the actual number of combat and supporting troops engaging in the operation was determined, it was necessary to determine the proper number of QM troops to successfully support them. While it is true that numerous minor changes were made in the troop list, the over-all strength remained the same. No difficulty was encountered in obtaining the assignment of the service troops requested. Since, however, most of the service troops assigned were, at the time, actually engaged, under control of the Base Sections, in work connected with the operation, it was necessary for the Quartermaster to cooperate closely with the Base Sections and refrain from asking for release of Quartermaster units until the last possible moment. Excellent cooperation from Force 141 and AFHQ was received in obtaining the service troops that were requested as absolutely necessary to the operation.

After the troops to be used were definitely decided upon, the problem of allotment of a suitable quota of Quartermaster service troops to each Sub-Task Force was encountered. Due to the nature of the operation, it was agreed that each Sub-Task Force should be self-sustaining for a period of approximately 30 days. It was not anticipated that consolidation of all beach heads would be completed as early as it actually happened. Visualization of the necessity for discharge of cargo in Syracuse necessitated the organization of an additional group of service units for that point to control and forward such cargo. All the above considerations resulted in a "splitting up" of service troops that appeared to be complicated, but in operation the arrangement proved highly successful. Final allotment of service troops to Sub-Task Forces, Army and Base Section is shown in the Troop List, elsewhere in this report.

In selecting Quartermaster troops for the operation, training of units had to be taken for granted. Those already in the Theater were engaged in the same type of work expected of them in the operation, but under different conditions. Those enroute to the Theater arrived too late to enter upon any comprehensive training program.

OVER-ALL SUPPLY

It was found essential not to wait until the Tactical Plan and the Troop Lists were final, before placing demands for certain supplies considered necessary to the success of the operation. Much time was spent before the responsibility for meeting our figured demands for supplies definitely was fixed, requiring in numerous instances vigorous defense of our estimates.

From G-3 was obtained estimates of troop strengths and compositions at various periods of the operation, which it would be the responsibility of Seventh Army to supply.

Sources of supply were determined by higher authority; (these will be covered by G-4 in more detail). Essentially, the force was to be initially equipped and supplied, until D plus 14 from North African sources.

On D plus 14, the first convoy loaded in the United States for discharge in Sicily was to put in at Sicilian Ports, then under control of Allied Forces.

SOS NATOUSA was designated as the agency with which Headquarters, I Armored Corps, would deal on supply matters. Direct communication was authorized.

Since Headquarters and the Quartermaster Section of SOS NATOUSA were in operation in Oran, it was deemed advisable to set up a planning staff in that city. Consequently 5 April, Quartermaster Class I, II and III officers and one control officer were sent to Oran and opened planning headquarters.

* * *

RIGHT — AIR PHOTOGRAPH OF QUARTERMASTER CLASS II AND IV DEPOT, AT PALERMO.

First step in preparing for over-all supply for the operation was to assure that the necessary supplies either were on hand or enroute to North Africa. Principal items in which shortages were anticipated were life belts, water cans and gasoline cans. Adequate supply of these were assured by cabling to the United States to get them top-loaded on convoys scheduled to arrive in North Africa prior to the beginning of the operation.

Based on an average strength of 130,000 troops for the period D to D plus 30, an over-all requisition for Class I, II, III, and IV Supplies was submitted to SOS NATOUSA. This served only as a guide to enable that agency to determine the adequacy or shortage of their stocks and to permit them to order from the United States in time to get delivery on UGS 8, 9 and 10 convoys.

Several innovations were initiated by the Quartermaster Section for this operation. Of prime importance were such items as: Assault Packs of Class II supplies; the specially packaged Hospital Supplement, to be used with emergency rations; individual gasoline stoves on the basis of one per squad for infantry divisions; a high percentage of pre-broken down rations ("B" 5-in-1), and company laundry sets.

Subsequent to the submission of over-all requirements for the period D to D plus 30, the Quartermaster computed and requisitioned for, on SOS NATOUSA, supplies for the maintenance of the force, loaded in the United States on UGS-11 and subsequent convoys to include UGS-19.

SUPPLY BY PHASES

After assuring supply of the operation in over-all quantity, it then became of first importance to take steps to see that this large pool of supplies be distributed to the right places and at the right time to supply the separate phases of the operation.

It was deemed essential that each boat and craft carrying troops to Sicily should have on it sufficient food, water and gasoline to support troops until the arrival of the next follow up, plus supply for any troops previously put ashore on the objective.

Since the assault was made by three separate Sub-Task Forces, "Cent", "Dime", and "Joss", each consisting of three or more separate groups, some lifted by craft, others by ships, mounting from all north African ports from Oran to Sousse; and additional Sub-Task Force, "Kool" was mounted as a floating reserve and the 82d Airborne Division was mounted by air from Kairouan, Tunisia, supplies in sufficient quantity to support each of these groups independently of all others, had to be set up and made available at the proper port and at the proper time, well in advance of the mountings.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

This cutting up of supplies into small lots was dependent entirely upon the tactical plan. Number and composition of troops allotted to the assault and the follow-ups determined the type and quantity of supply needed. A "happy medium" in the lift of troops and the lift of supplies had to be arrived at, since the available lift of ships and craft was, in the end, the determining factor for the whole operation.

Phased requisitions were accomplished and submitted to SOS NATOUSA, which agency then assumed the task of moving and loading the supplies called for. The entire resources of SOS NATOUSA and its base sections were then applied to the success of our mission ahead of all else. Their resourcefulness, ability, determination and energy are deserving of high praise.

III. OPERATIONAL PHASE

Planning of the operation Husky having been completed with the embarkation of troops for the assault there remained the task of supplying the fighting troops over beaches, subjected at first to enemy air and ground action and in many places over ground heavily mined. The best test of a plan is its execution. The fact that the plan for supply of the operation Husky worked, should be sufficient proof of its basic soundness. Some of the details of its execution are enlarged upon herein in chronological order.

Supply activities in the operation as a whole readily divided into two parts, namely prior and subsequent to the securing of the Port of Palermo. This natural subdivision from a time standpoint is further apparent in that the supply activity divided itself at the same time geographically into roughly northern and southern sectors of the American sphere of activity.

Control of QM supply was initially out of the hands of the Army Quartermaster in that supplies had been allotted to shipping and craft pertaining to sub-task forces, to unload over beaches under sub-task force direction and to be used as prescribed by task force commanders. Each sub-task force had its own shore Engineer regiment, trained in unloading, sorting, storing and issuing supplies of all types. These shore regiments were reinforced by QM service troops, namely railhead, gasoline supply and depot supply for assistance in handling QM supplies.

Unfortunately total lift available did not in all cases permit the bringing in of these service troops as early as was considered desirable by the Army Quartermaster.

The Quartermaster element of the assault consisted of the Army Quartermaster and two selected non-commissioned officers. (Remainder of the Quartermaster Section, seven officers and 23 enlisted men, arriving on subsequent follow-ups, in keeping with prearranged plans which called for checking with sub-task force representatives to be sure that all supplies called for were available, and to lend assistance if desired. Rear echelon office, in Bizerte, with the Quartermaster executive officer in charge, closed D plus 14.)

Landings of supplies were made at Scoglitti (near Vittoria) for 45th Division and attached troops (Cent Force); at Gela for 1st Division and attached troops (Dime Force); and at Licata for 3d Division and attached troops (Joss Force). The Kool (2d Armored Division) Force moved troops and supplies in over the established Dime beaches. Supply was initially from water's edge, later moved to points from one to five miles inland.

Losses of QM supplies in the initial landings were negligible, the principal loss being the Liberty ship K-40 with approximately one-seventh of the Kool force supply of 21 days. There was never any lack of food, gasoline and water. Some apprehension was felt at D / 6, due to the late arrival ashore of supplies of D / 4 follow up.

On July 17 the unloading and control of Dime beaches were taken over by 1st Engineer Special Brigade, followed by the same action on the 18th in the Cent Area and on the 19th in the Joss Area. It was deemed advisable to decrease unloading activity in the Cent Area, moving such supplies as were still afloat in that area to unloading points farther west, nearer the contemplated points of use. Consequently some QM cargo pertaining to the 45th Division was unloaded over Gela beaches and at Licata Port. Mixing of supplies, already apparent in the Dime-Kool Area, made it more necessary that control pass to Army thru the 1st Engineer Special Brigade.

The tactical trend was to the North by II Corps and to the West and Northwest by the Provisional Corps. Roughly these two Corps were supplied in sequence as follows:

II Corps from Gela, Caltanissetta, Petralia, Nicosia, and Cesaro.

Prov. Corps from Licata, Empedocle, Sciacca, Allesandria, later Palermo.

Times of opening and closing supply points are shown in G-4 charts. Stockage of these supply points was made by rail and motor from stocks unloaded at Gela, Licata and Porto Empedocle by the 1st Engineer Special Brigade under direction of Seventh Army.

Only at two times during the period prior to the fall of Palermo was there any basis for apprehension in supply matters. These were on D-day when the Dime beaches were in danger of being over run by German Armored elements and about D / 6 when supply level in dumps dropped to less than two days in rations.

The fall of Palermo on July 22 was opportune. Transportation was being strained to supply troops from the south coast over tortuous roads. The opening of Palermo relieved this and permitted the concentration of effort by the 1st Engineer Special Brigade on supply of II Corps in vicinity of Petralia and Nicosia.

On July 28th six coasters loaded with rations and gasoline arrived and commenced discharge in Palermo harbor. Up to that time only five ships of UGS-11, our source of supply after D / 11, had arrived off the south coast, none in Palermo. Enemy action by bombs on August 1st added a bit of apprehension, hitting one coaster and one train loaded ready for departure. Liberty ships of the UGS-11 arrived off Palermo on July 28, and followed the six coasters to discharge points. Thereafter the ration and gasoline problem was one of movement to points along the north coast from where they could be picked up by using troops. The arrival of the 9th Division in Palermo Port, crowded at best, slowed up the discharge of cargo to the point where total tonnage of rations unloaded fell below tonnage consumed. This condition was remedied on 10th August by the arrival from North Africa and discharge at San Stefano of one solid LST of rations, (200,000) mostly "B" 5-in-1; on 12th August another LST loaded with 195,000 rations, mostly "C" arrived from North Africa and discharged at Brolo.

From Brolo, rations and gasoline were shuttled to 3d Division in vicinity of Barcelona on August 16th and 17th by LTs. This movement of essential supplies at a time when they were critically needed and the road blown out hastened the close of the campaign.

Routine supply followed thereafter until the close of the campaign. On 17th August plentiful reserves of gas and rations were available to combat troops at Nicosia for 1st and 9th Divisions and II Corps, with additional reserves at Tusa and Brolo on the north coast for 3d and 45th Divisions. At no time during the operation were tactical decisions and maneuvers held up for lack of QM supply.

The above sums up in narrative form the QM supply of operation Husky. Paragraphs below make comment on specialized phases of QM activity.

Type of rations furnished front line of fighting units were "C", "K" and "B" 5-in-1. Only isolated instances, and principally in one division which brought a considerable supply with them in organic vehicles, did the straight "B" ration reach front line troops. This was not unusual since the first "B" rations to arrive in the theatre was from the five ships of UGS-11 which discharged late in July at Licata and Empedocle. A considerable quantity of "B" ration components had to come ashore

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

before a balanced menu could be issued. After August 1st a small percentage of rations shipped from south coast to Nicosia was "C" type. The "C" 5-in-1 ration proved its worth in this campaign. Troops almost invariably preferred it to any other type for operations in or near the front lines. The preparation in combat is largely dependent upon the presence in an organization of a considerable number of individual stoves; in this respect our force was quite fortunate. The "K" ration served a particular need in the ambitious operations of the 3d Division. "C" Rations furnished the principal diet for prisoners. Due to the lack of cooking facilities in temporary prisoner of war enclosures, issue of any other type of ration was impractical.

Bakery units arrived through Port of Palermo on 7th, 9th and 13th of August. First unit to arrive was a platoon equipped with British mobile equipment. Leaving behind a detachment of four enlisted men, who with prisoner labor immediately went to work to put in operating condition an Italian millitary bakery in Palermo, the platoon proceeded to Nicosia and the following day baked 19,000 pounds of white bread. From the second bakery organization to arrive, one platoon was immediately dispatched to San Agata to bake for the 3d Division, and one platoon to Licata to bake for shore regiments and other troops based in that vicinity. Bread was an important morale factor.

Captured in Palermo was some 80 tons of fresh frozen beef, property of the Italian army. After Army control was established in Palermo, the policy outlined by the Quartermaster and approved by the Chief of Staff was to make one complete issue to troops, issue daily to hospitals, for their patient strength, and turn the balance over to Civil Affairs. All troops ashore in Sicily, including Air Corps which shipped its mess out of Palermo by planes, received equitable distribution of this meat. Upon the arrival, of the refrigerator ship "Tivvies" on August 21, fresh meat issue schedule on the basis of 1/2 pound per man, every third day, was put into effect. Again special effort was put forth to assure equitable distribution to all units and no special allowances were granted except to hospital units for their patient strength.

The Hospital Supplement was a marked success from the start and served a long felt need in supplementing the "C", "K" and "B" 5-in-1 rations for hospital patients. The additional coffee, sugar, milk, soup, fruits and fruit juices provided therein proved to be exactly what was needed by hard-pressed hospital units for the diet of shock cases and sick and wounded unable to eat solid foods.

The Quartermaster Companies, (Laundry) arrived in Palermo on August 6 and 7. The first units ashore were dispatched to the 120th Evacuation Hospital, which was well forward. Two field hospitals were near enough to utilize the same facilities. After several days of reconnaissance for water, a detachment of two units was sent to the vicinity of Trabia to support II Corps medical installations. A complete platoon was sent to Licata. One platoon was set up in the area of the 91st Evacuation Hospital in Palermo to service both the 91st and 57th Evacuation Hospitals and remaining units of the two companies were set up in Palermo to do organizational laundry. Until the arrival of the laundry companies all hospitals had found lack of laundry facilities to be a major problem, and at the time laundry service became available they were hard pressed for clean linen.

Labor was plentiful and of good quality. Italian prisoners worked cheerfully and willingly. No attempts at sabotage were noted. Quartermaster Service Battalions performed creditably.

Graves registration activities were generally well handled. Ample Graves registration personnel was available, employed by attachment to combat divisions, later a platoon and a company headquarters coming directly under Army control. The fact that Administrative Order No. 1, included as an annex a thorough and carefully worked out directive on Graves Registration was largely responsible for creditable work on the part of combat troops in the identifying and burial of their dead and in cooperation with the Quartermaster Graves Registration companies.

One salvage collecting company arrived at Palermo 22d July. A detachment was dispatched to Prizzi immediately to bring captured German rations to Palermo, the remainder of the company putting in order the Italian Engineer Depot at Palermo, which was used as the Quartermaster salvage depot. After all captured rations at Prizzi had been brought to Palermo, detachments of the company were sent through out the Palermo area to collect and bring into the depot, miscellaneous salvage materiel. Clothing and equipment were repaired to the best of the company's ability, with its limited facilities. Metal was prepared for shipment. With only one salvage collecting company on the island it was impossible to systematically clean the battlefields and it was necessary to call upon divisions to clean up their areas and bring salvage to Class I Dumps to be shipped into Palermo.

While it was generally understood, and published in administrative plans and orders, that no Class II items would be available until after D plus 14, (arrival of UGS-11), as early as 10 days after D day, demands from combat troops were received for large quantities of socks and shoes. The 82d Airborne, 3d and 45th Divisions were supplied these items by air shipments from North Africa. Some socks from the captured depot at Santa Cateldo were issued but were found to be unsatisfactory because of heavy ribs. Socks, shoes, leggings and outer clothing wore out rapidly, the rate being much faster than anticipated. The 45th Division actually had a surplus of socks and shoes but they were not available as they were in barracks bags far to the rear of the action. It was generally agreed by division quartermasters that in any future operation the use of barrack bags should be eliminated and that enough Class II supplies to provide one complete uniform replacement per man should be carried, in bulk, on division trains.

IV. CONCLUSIONS

1. Quartermaster planning for the operation was basically sound. Supplies were in sufficient quantity and of correct type.

2. Quartermaster planning would have been improved had it included the requirements:

   a. That Graves Registration personnel be taken in the assault waves by Sub-Task Forces.

   b. That Sub-Task Forces eliminate the use of barracks bags, hauling Class II, in the division trains.

3. The "B" 5-in-1 ration has a definite place, with the emergency rations, "C" and "K", for use by combat troops; that it is especially practical also, in that it permits issue of a balanced "B" ration during a fast-moving campaign where there is not sufficient time to break down and ship the normal "B" ration.

4. The Hospital Supplement was a success and filled a definite need for sick and wounded prior to the issue of straight "B" rations.

5. Issue of individual gasoline stoves on the basis of one per squad in infantry divisions contributed substantially toward the health and morale of troops.

6. Quartermaster troops, operating with Base Sections, suddenly thrown into active combat operations are not on a par with combat troops from a standpoint of physical conditions.

7. More care must be taken by all commanders to prevent waste, pilfering and looting of supplies.

8. Eight officers, 1 warrant officer and 25 enlisted men is not sufficient personnel for the Quartermaster Section of Army headquarters.

V. RECOMMENDATIONS

1. That Quartermaster planning for subsequent operations, of the same type, follow, substantially, the same lines as the planning for the Sicilian campaign.

2. That future plans require assault units to take attached Graves Registration personnel.

3. That future plans require elimination of the barrack bag and that Division trains carry one complete uniform replacement per man, in bulk packages.

4. That, for a similar operation, there should be no less than two Quartermaster companies, Salvage Collecting; that they should be brought in early and follow combat troops as closely as possible.

5. That in initial stock of Quartermaster Class II supply should be set up, in addition to combat maintenance stocks.

6. That a large proportion of "B" 5-in-1 rations be included in the supply plan of any future operation and that the percentage of "C" and "K" rations be reduced.

7. That the Hospital Supplement, as packed for this operation, and marked with a red cross, be adopted as standard for issue at any time the straight "B" ration is not issued.

8. That prior to any subsequent operation physical "hardening" training be instituted for all troops on routine duty with Base Sections, and that checks be made to be sure that each soldier is qualified in the use of his basic weapon.

9. That an intensive campaign of education against waste, pilferage and looting of supplies be conducted by all commanders.

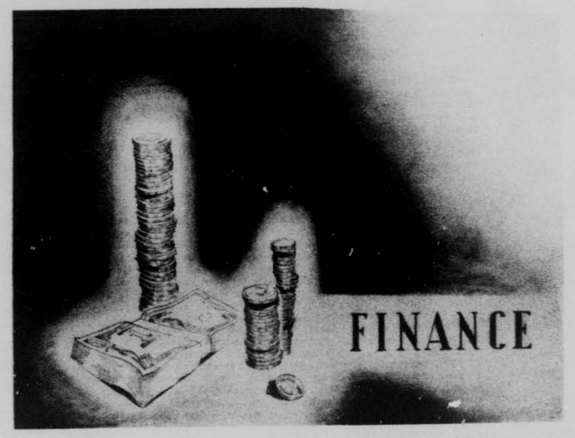
10. That Quartermaster laundry units be attached to evacuation hospitals and move direct to the theater with them, or that some sort of laundry equipment be incorporated into Tables of Basic Allowances for medical units.

11. That Tables of Basic Allowances for infantry division be changed to authorize one individual gasoline stove per squad.

12. That there be no less than 14 officers, four warrant officers and 35 enlisted men in the Quartermaster Section of Army Headquarters, in order that:

   a. There may be sufficient personnel to operate both forward and rear echelons, when necessary, with at least two officers on each class of supply in the forward echelon, as insurance against interruption of efficient operations, in the event an officer should become a casualty.

   b. One officer and two qualified non-commissioned officers may be sent with each sub-task for headquarters.



Wyatt Wasson
Colonel, G.S.C.,
Quartermaster.

REPORT OF THE JUDGE ADVOCATE

Immediately following the receipt of the directive to prepare for the Sicilian operation, 22 February 1943, the office of the Staff Judge Advocate divided itself into three sections: One section dealing exclusively with military justice, military boards and commissions, and the more normal functions of a Judge Advocate office; one section concerning itself primarily with matters relating to the Hague and Geneva conventions, claims, military affairs, and legal questions which might arise in an enemy occupied territory; and the other section was devoted to Civil Affairs.

The tables of organization for a Reinforced Corps provided for a Civil Affairs Section with two officers and four enlisted men. This section was not activated until 16 June 1943, and the officers and men in the Judge Advocate Section, without extra personnel, assumed the triple functions mentioned.

As these three departments were operated separately, they are discussed separately.

JUDGE ADVOCATE SECTION

Steps were taken to survey all units, including divisions, then assigned or attached to this headquarters, for the purpose of determining which members were nationals of an enemy or enemy-controlled country in order that they might be transferred to a Base Section and not sent into combat. A request was made to NATOUSA to permit the immediate transfer of these men to a Base Section; which request was granted. In undertaking this survey the Judge Advocate office also surveyed all corps units to determine the number and category of aliens in order that the office might assist in the naturalization of these aliens; this was done and arrangements made for such aliens to appear before the naturalization officer. This process was extended to the new units assigned and continued until our departure from North Africa. Unfortunately, the naturalization officer did not arrive in North Africa from the States in sufficient time to permit the full accomplishment of this work.

During the month of April 1943, the corps units began to move to their respective training areas and became widely separated from headquarters making control extremely difficult. It was necessary to determine their new geographical location and group them for the purpose of expeditious military justice and administration. Small units were attached to larger ones, and officer personnel was pooled in order to obtain a sufficient number of experienced officers for court-martial purposes. Because of this, and also due to the fact that new units arriving from the States had officers who were untrained in military justice, it became necessary to instruct these officers by mail in the proper method of conducting courts-martial and also to instill into them the qualities of disciplinary leadership required in a combat area. Instructions dealing with discipline and forms of procedure before general and special courts and also a form for the record of trial, were prepared, mimeographed and distributed. In some instances, officers and enlisted men from the Judge Advocate Section were detailed to sit with and instruct inferior courts in their duties.

During the month of May particularly, many merchant seamen and other civilians came into the Corps Headquarters area and therefore became subject to the disciplinary control of the Corps Commander. In order to properly exercise this control a court was established in Mostaganem and it was instructed as to the documentary and procedural requirements necessary for the complete trial and enforcement of the sentences against merchant seamen and other civilians serving with the Army.

SURRENDER AND SECURITY. There was prepared and distributed to Sub-Task Force Commanders, instructions relating to the acceptance of local surrenders. These instructions provided inasubstance that Sub-Task Force Commanders and Commanders of subordinate units could accept the unconditional surrender of enemy forces in immediate contact with, or in the area of operation of, such commanders and that all other offers of surrender would be reported immediately to the Commanding General Force 343 without discussion with enemy commanders or authorities of the terms of such offers. These instructions also setforth for the personal guidance of Sub-Task Force Commanders, certain conditions relative to the disarming of the area, disposition of air-craft and coastal vessels, protection of communication, essential utilities and port facilities, which could be enforced, where applicable, on the acceptance of local surrenders.

CIVIL AFFAIRS

The section of the Judge Advocate office which dealt with civil affairs first devoted itself to an exhaustive study of the 1918 plan of the occupation of Germany and also reports concerning the German occupation. The mistakes made in Germany were carefully analyzed and plans evolved to avoid the same errors and pitfalls.

During this period the Civil Affairs Section of the I Armored Corps, Reinforced, had not been activated and the function of preparing an operating plan for Force 343 for the Military Government of occupied territory was assigned to the Judge Advocate Section. During the latter stage of the planning a clerical force of two additional enlisted men was constituted under the Judge Advocate and close liaison established with the ANDOT planning section of Force 141. Several trips were made to Algiers to coordinate this work with the overall ANDOT plan; likewise, conferences were held at Headquarters Force 343 between the chiefs of all general and special staff sections and ANDOT representatives from Force 141.

Based upon the general provisions of War Department FM 27-5 and the overall plan of ANDOT, a plan for Military Government of Occupied Territory was prepared for Force 343. The plan had as its objective the restoration of law and order and normal conditions among the civil population as soon as possible after occupation. It provided that the Commanding General, Force 343, subject to policies and instructions promulgated by higher authority, would have final responsibility and authority in the conduct of Military Government within his zone of operations. It likewise, provided for the delegation of similar responsibility and authority to Commanding Generals of Sub-Task Forces within their zone of operations.

Arrangements were made with ANDOT to attach civil affairs officers to Headquarters Force 343 and to the various sub-task forces for the purpose of handling civil affairs functions for occupied cities, towns and areas. Task Force Commanders were given discretionary powers as to the number of Civil Affairs officers who would accompany the initial landing forces and as to the time additional Civil Affairs officers would be sent ashore.

Recognizing that military government could not be set up until organized resistance had ceased in an invaded area, in conjunction with Staff Sections of this headquarters, detailed plans were prepared to extend their functions to supervise the policing of the civilian population, adoption of health measures and for the repair and operation of utilities essential to the military forces until such time as these functions could be turned over to civil affairs officers.

Conferences were held with the representatives of Sub-Task Force Commanders and their plans for the handling of civil affairs were coordinated with the plan of Force 141.

Prior to departure from North Africa, an effort was made to complete the trials and records of all pending summary, special and general courts-martial cases and to keep abreast of the daily influx of work so that prisoners could be disposed of prior to landing on enemy soil. Units which were not to be a part of the initial invasion forces were attached to a Base Section or other stationary unit for court-martial jurisdiction. Specific authority for this purpose was obtained from NATOUSA.

During the period of preparation for the embarkation, courts-martial were at a low ebb, indicating the extremely high morale and discipline of the troops.

MILITARY AFFAIRS IN OCCUPIED TERRITORY

CONVENTIONS AND TREATIES. In planning for the operation an exhaustive study was made of the provisions of the Hague and Geneva conventions of 1907 and 1929 and of the Rules of Land Warfare published in War Department FM 27-10. The operational plans of all sections were examined to insure that the provisions of those plans conformed strictly to the principles of these conventions, treaties and rules of land warfare. This study included conditions under which competent authority might make an exception to these rules by way of legal reprisals for illegal conduct of the enemy, including enemy civilians.

PRISONERS OF WAR. Assistance was given the Provost Marshal in the preparation of a plan for the custody, handling and processing of prisoners of war and political internees. This involved application of provisions of the convention of 1929, particularly with regard to the treatment of sick and wounded prisoners of war, evacuations, compensation, type of work on which prisoners of war might be utilized, kinds of disciplinary punishment available, and the tribunals for administering such punishment, the handling of protected (Medical and Chaplain) personnel and conditions under which exchanges and repatriation should be sought. After arrival in Sicily a plan of parole was devised by this office and instructions issued together with a detailed form of parole.

PURCHASES AND PROCUREMENT. This office assisted G-4 in preparing the Purchase and Procurement plan for use in occupied territory. This included a legal determination of what constituted public property, private property, and the conditions under which such property could be utilized by our force. It included, likewise, a determination of the classes of property which could be utilized without compensation and that for which compensation must be paid and the uses of requisitions for obtaining personal property and services in appropriate cases.

CLAIMS. The matter of the payment of claims within occupied countries as provided for under the Act of January 2, 1942, as amended by the Act of April 22, 1943, was exhaustively studied and, in conjunction with Force 141 and ANDOT representatives, a plan was prepared for considering, adjusting, and making payments of death, personal injury, or property damage claims submitted by the inhabitants of the occupied territory arising from the non-combat actions of our forces. This necessitated several trips from Mostaganem to Algiers for conferences which resulted in an agreement by representatives of Force 343 and 545 as to the general principles to be followed by both the American and British forces in the consideration of such claims. Consideration was given, also, to the question of compensation to be paid to civilians (enemy inhabitants) employed directly by our forces and who are injured or killed while in the performance of such duty.

MILITARY TRIBUNALS. Since the plan of operation required the Commanding General of Force 343 to act as Military Governor, under the Commanding General of Force 141, of the territory occupied by our troops, provision was made for the appointment, staffing and procedure of military tribunals (military commissions, superior and provost courts) for the trial, if necessary, of civilian inhabitants during the combat phase of the operation and prior to the establishment of Allied Military Courts by ANDOT.

On 16 June 1943 a Chief Civil Affairs Officer and assistants were attached to this headquarters, the Civil Affairs Section was activated and the Judge Advocate relieved of these functions; he was instructed, however, to act as an advisor to the Chief of Staff on all civil functions and to coordinate the planning and operation of the Civil Affairs Section with other Staff Sections.

SUPERVISION AND LIAISON. For the purpose of coordinating these various functions and to give legal advice and interpretations to the Commanding General and Staff members of Force 343, a member of the Judge Advocate General's Department and one enlisted man accompanied the invasion forces. During the early stages of the invasion, liaison was established between the staff sections and an ANDOT representative to deal with the many new problems of requisitioning, material and workmen for the immediate construction and repair of necessary utilities and port facilities considered in plans made for the operation.

BASE ECHELON

BASE SECTION. Upon learning of the decision that Force 343 would operate its own supply system in Sicily, a table of organization was prepared for a Base Judge Advocate Section. This table provided for 1 colonel, 1 major and 4 enlisted men.

The personnel requirements for the Base Section were predicated on the assumption that at a future date, after the Island had been reduced, the Base Section would be severed from Force 343 and operate directly under NATOUSA. For this reason the table provided for a Judge Advocate set-up capable of handling without assistance from this headquarters, all the legal problems of a large Base Supply Section. The personnel of the Base Judge Advocate Section arrived in North Africa as part of the 6625th Base Area Group (Prov), on 29 June 1943, too late for orientation and instruction by this office while still in North Africa, but fully equipped to undertake the duties assigned.

After arrival in Sicily, some orientation of the Base Judge Advocate Section was accomplished through conferences with its officers and through temporary duty of some of its enlisted personnel with the Army Judge Advocate Section.

TENTH PORT OF EMBARKATION. The Tenth Port of Embarkation arrived in North Africa about the same time. This organization had with it a Judge Advocate Section of 1 Major and three enlisted men. After arrival in Sicily the Tenth Port of Embarkation was attached to the Base Section. The Port Judge Advocate Section continued to function separately, but under the supervision of the Base Judge Advocate Section.

CONCLUSIONS

1. In preparing, for an invasion, the normal functions of a Judge Advocate's office are all that the officers and enlisted men now assigned to the Section, under the T/O Reinforced Corps, can properly handle. Matters pertaining to Civil Affairs, International Law, Rules of Land Warfare and allied specialized fields are duties that, out of necessity, must be undertaken by the Section. From these duties, legal and quasi-legal questions arise in the early stages of occupation of enemy territory that require special handling-especially where the territory invaded is expected to become "friendly" enemy territory and the goodwill of the population of the territory is desired.

2. The duties and powers of the Commanding General of the invasion force and those of the Commanding General of the Allied Military Government organization such as ANDOT are not sufficiently delineated and at times overrun each other. Jurisdictional questions arise which deter expeditious handling of situations that are presented and at times may become a source of embarrassment to the Commanding General of the combat forces.

3. The language of the Rules of Land Warfare, FM 27-10, is not sufficiently clear; the manual lacks interpretation and explanatory data of the general terms of the Hague and Geneva conventions, particularly with reference to the distinction between private and public property and its use by an invading force; there is an insufficiency of material dealing with prisoners of war and ways that they may be legally utilized.

4. There is no definite policy on the rate of compensation to be paid to enemy inhabitants directly employed by the armed forces of the United States for injuries or death sustained in the performance of such duty; claims of enemy inhabitants, resulting from non-combat activities and offenses of members of the armed forces arise, with no definite policy prescribed for their receipt and processing.

5. Junior officers assigned to this theater do not have sufficient knowledge or experience in military justice and discipline. They are assigned to the theater without any significant training in Military Justice, and for the most part have never participated as a member of a court; their knowledge of the Manual for Courts-Martial is negligible. The number of known competent court reporters is limited and it is frequently necessary to delay the trials of cases until a court reporter becomes available. The lack of competent court reporters has done more to delay the trial of cases than any other factor.

THIS PAGE IS UNCLASSIFIED

RECOMMENDATIONS

1. a. That the Civil Affairs Section authorized for an Army or Reinforced Corps be activated no later than the beginning of the planning phase.

b. A permanent staff officer be assigned to the Section to remain with the force as advisor to the Commanding General on Civil Affairs matters. He need not be a Civil Affairs Specialist for the particular territory invaded, but should be well grounded in the general principles applicable to the occupation of enemy territory as well as having previous military experience. AMGOT or officers of a similar organization attached to an invasion force for a special operation should function under his general supervision.

c. An additional officer be assigned to the Judge Advocate Section of an invasion force the size of a reinforced corps or army. He should be versed in International Law, the terms of the Hague and Geneva Conventions, and the Rules of Land Warfare. If it is impracticable to assign an officer with this background, an officer with legal experience should be assigned sufficiently far in advance so he can acquaint himself thoroughly with these fields.

d. A Judge Advocate should accompany the initial invasion force. In his capacity as legal advisor to the Commanding General, he would act as liaison between staff sections in dealing with the various legal and quasi-legal problems arising from the invasion.

2. The contents of FM 27-5, Military Government, be extended to cover allied operations. This should include a description of the system wherein an allied commander is appointed as Commander in Chief with several Task Forces or Armies operating under him in designated areas and a separate general officer is appointed to supervise Military Government activities for the entire occupied territory. The relationship between these various commanders should be delineated.

3. FM 27-10, Rules of Land Warfare be supplemented to include the following: interpretation and explanatory data of the terms of the Hague and Geneva conventions in the light of the policy of our government; distinctions between private and public property and their uses by an invading force; handling of prisoners of war and methods, with concrete examples, of how they can be legally utilized.

4. That the War Department determine and publish a definite policy on the question as to whether and to what extent compensation be paid to enemy inhabitants, who are directly employed by the armed forces, for injuries or death received in the performance of duty; that the War Department determine and publish a definite policy on claims of enemy inhabitants for damages occasioned by non-combat activities and offenses of members of the armed forces.

5. a. That junior officers be given some training in military justice before being sent to an overseas theater; that they be given more instruction in the disciplining of troops for offenses committed by members of their units so that cases which should be treated under the 104th Article of War not referred to court-martial.

b. That there be assembled and trained in this theater a pool of court reporters so that the trial of cases might be handled in a more expeditious manner and delay in the trial of offenders avoided.

Judge Advocate

REPORT OF THE FINANCE OFFICER

Inasmuch as the I Armored Corps was without an Administrative Finance Section until May 31, basic finance plans were made thru consultation with the Disbursing Officer of the 25th Finance Disbursing Section which was attached to the Corps.

Early plans contemplated a strength of some 225,000 troops including approximately 40,000 to be attached to Headquarter's direct control. The Divisional Finance Sections were apparently sufficient to service their personnel, with the exception of the Third Division to which was attached approximately 25,000 above normal strength. In order to compensate for the extra troops and to provide the necessary reserve which could be shifted as local concentrations caused overloads on any particular Finance Section, the 26th Finance Disbursing Section was assigned to I Armored Corps, the 30th Section to II Corps, and the 32nd to the 3rd Infantry Division. Due to anticipation of a large volume of currency exchange and excessive personnel loads, a temporary addition of five enlisted men each was authorized for each of the 25th, 26th, and 30th disbursing detachments and to the II Corps Finance Section. It was next necessary to see that all units were properly funded as a basis of two months requirements. While it was anticipated that air shipments of a sufficient quantity of special Allied Military Currency would be delivered in time to permit the making of disbursements in that medium upon arrival in Sicily, the contingency of non-arrival had to be anticipated by Yellow Seal funding.

G-2 Officers in early operations were supplied with funds in advance of departure. Since their requirements were expected to partially in gold coin, it was necessary to fund the various Disbursing Officers with sufficient amounts of this specie. It was also necessary to supply Civil Affairs Officers with sufficient funds for operation pending receipt of Allied Military Currency. The transferring of funds to Civil Affairs Officers was without precedent inasmuch as these disbursements were not to be accounted for to Finance Officers thru regular disbursement voucher forms. A plan was formulated whereby AMGOT (Allied Military Government Occupied Territory) Officers could, on approved requisition, draw the necessary funds from the nearest Disbursing Officers, who would drop the amounts from their accountability on a voucher supported by the requisition and accompanying receipt. When AMGOT received their consignment of special Allied Military Currency, the need for continuance of this procedure ceased, and arrangements were made for the return to Disbursing Officers of sums disbursed for this purpose.

Early in June advice was received from the 1st Engineer Special Brigade that their T/O provided a Disbursing unit of one officer and eight enlisted men and requested that the unit be activated. There being no finance personnel available, other than one officer, who was assigned and reported about July 4. Two trained finance enlisted men from the 25th and 26th Disbursing Sections were detached by the I Armored Corps and assigned to the Brigade with instructions that it would be necessary for the Brigade to furnish the balance of personnel and equipment. Upon arrival in Sicily it was found that the Brigade had only been able to furnish three of the additional six and that they were untrained in finance. Early in August Finance replacements arrived in Sicily and three finance trained enlisted men were assigned to the Brigade and four additional placed on detached service therewith, the additional men being required due to the fact that the Brigade with attached troops had been increased to approximately twenty thousand troops.

Information was received late in June that plans for the Base Area Group included no Finance Administrative or Disbursing facilities, and higher headquarters advised they were unable at that time to furnish such personnel. However, after arrival in Sicily, it developed that the total personnel brought to Sicily was considerably less than originally planned, and it was possible to assign the 32nd Finance Disbursing Section to the Base area, as in the meantime the additional troops attached to the 3rd Division had been detached therefrom.

Due to transportation limitations, plans did not contemplate the arrival in Sicily of either Administrative or Disbursing Finance personnel until sometime after D-1. However, limited unanticipated transportation became available, which enabled the Assistant Finance Officer, to arrive with the Advance Headquarters. It was found that in the early stages much need for Finance facilities were apparent. Funds were needed by Procuring Officers, a lack of local currency was a handicap, and Agent Officers were obliged to carry considerable sums inasmuch as no Disbursing Officers were available for making returns. Had it not been for the fact the Disbursing Officer of the 45th Division, (who arrived with the Assault Forces), was located, the entire expedition might have been without means for obtaining additional cash for the procurement of supplies and services.

Shortly after arriving in Sicily, AMGOT received a shipment of Allied Military Currency, a part of which was furnished the Seventh Army for the purpose of drawing in U. S. Currency and such French Currency as had been brought in by the troops, as well as for making current payments. The amount received proved to be inadequate for these purposes, and as further shipments of the August payments to troops would be partially in U. S. Currency, thus negating the results that had been obtained at a considerable cost in labor by the early circulation of Allied Military Currency and withdrawal from circulation of other forms of currency. The withdrawal of U. S. Currency from local circulation will have to be made again upon receipt of sufficient stocks of Allied Military Currency.

As an interesting sidelight and as a tribute to the thrift of U.S. Military personnel, it is deemed pertinent to quote the following statistics covering payments made during August 1943:

Gross Pay		13,914,887.19
Class B Allotments - War Bonds	658,962.60	
Other allotments	6,788,951.28	
Voucher Coll. (Fld. Rations)	275,896.30	7,717,810.18
Planned savings & fixed expenses		6,197,077.01
Personal Transfers	1,056,515.00	
War Bond Transfers	20,831.25	
Soldiers Deposits	655,839.46	
Rects. from Army Post Offices (Money orders sold, etc.)	2,512,169.43	4,239,655.14
Intermittant savings		1,957,421.87
Amount retained for personal expenses, etc.		14
Percentage of pay retained		

Conclusions:

1. T/Os for major units should be furnished the Finance Officer during the initial planning stages so that plans may be made for the complete organization and training of Disbursing Units well in advance of the beginning of the operations. Proposed T/Os should be referred to the Finance Officer for his advice as to the advisability of providing Finance personnel therein.

2. Plans for initial operations should provide for arrival at the operations area, not later than D+1, of some representation from the Administrative Finance Section and also a skeleton Disbursing Section.

O. F. TILLMAN,
Colonel, F.D.,
Finance Officer.

REPORT OF THE INSPECTOR GENERAL

The planning phase of the HUSKY operation found the Inspector General's section, First Armored Corps, Reinforced, engaged in completing its regular inspection of Army troops. This section was not involved in the planning and so continued to carry out its normal duties.

On 29 June, the Inspector General and one enlisted man proceeded to Algiers and boarded the Monrovia. The remainder of the section proceeded from Oran to the headquarters at Biserte via Algiers. During the waiting period at Biserte this personnel made inspections of neighboring units and such investigations as were directed.

The movement of the section from Africa to Sicily was staggered. One officer and one enlisted man accompanied the D day convoy. One officer and one enlisted man accompanied D plus 4 convoy. The remainder followed as space became available. The section was thus reassembled at Agrigento on 23 July 1943.

During the stay on the Monrovia the usual shipboard inspections were made, and in addition an inspection was made on D plus 1 at Gela where troops therein were observed. During the early stages of the operation due to limited transportation inspections were limited to units within walking distance or occasional trips made in the company of other officers who were able to share their vehicle. By one or the other means every effort was made to observe the conduct and action of the Army troops. Later, after transportation became available, these inspections were extended to include all possible known installations. As the advance progressed the section moved with the headquarters from Gela to Agrigento and then to Palermo where the section was located at the termination of the campaign.

It was noted that: local inhabitants often dug up covered holes in vacated areas and scattered garbage, papers, and other articles over the area; troops were inclined to pay extravagant prices for everything including haircuts and laundry work; prisoners must be carefully supervised to maintain our standards of sanitation; frequent checks are necessary to keep souvenirs off uniforms and equipment.

CONCLUSIONS:

1. The advisability of having an Inspector General available to the commander at all times was proven when the day following the landing the inspector was given an investigation to conduct.

2. During battle unit commanders should not overlook the normal housekeeping duties which are so important in maintaining the health of the command.

3. All commanders should take steps to prevent:

a. Soldiers fraternizing with civilians and prisoners.

b. Burying anything of value to local inhabitants which lead the latter to uncover all covered holes in vacated areas.

c. Troops trading food and other articles or paying exorbitant prices.

RECOMMENDATIONS:

1. That emphasis be placed at all times on the need for maintaining a high standard of sanitation, particularly in respect to digging suitable and adequate latrines at the first opportunity.

2. That officers be required to rigidly enforce military courtesy, discipline and enforcement of uniform regulations.

3. That price control be enforced immediately.

4. Care of government property should be stressed.

5. That all units be thoroughly informed as to:

a. Treatment of prisoners of war.

b. What constitutes pilferage.

C. E. LEMPKE,
Colonel, I. G. D.,
Inspector General.

REPORT OF THE PUBLIC RELATIONS OFFICER

The Sicilian campaign provided a field test in which the tactical and administrative problems of the Public Relations Section were laid out as a blueprint for almost any subsequent operation. Measures taken to meet these problems offer a practical basis for the formulation of all future plans.

THE OPERATION IN BRIEF

Eighteen correspondents, four Public Relations officers and seven enlisted men landed with the 7th Army on D day, distributed among various task forces. After landing, the Section assembled and set up headquarters at Gela, operating out of the centralized point for several days.

When it became apparent that 7th Army Hq. would move to Agrigento, the Section proceeded to transfer its facilities there. Rapid progress of operations, and the attendant difficulty for correspondents to cover the fighting and return daily to Agrigento, soon made it necessary for the Section to again move; this time to Palermo.

Before the Palermo move, made two days in advance of the C.P., the Section acquired one additional officer, a mess sergeant, a cook and two drivers, along with a small amount of mess equipment. This enabled the Section to send to Palermo a forward echelon, which then advanced to Cefalu ahead of the C.P's of II Corps and the division pushing east along the coast.

Thereafter, it was found necessary to maintain a base office at Palermo and a forward camp at the front. Many more correspondents were arriving.

When II Corps moved to Nicosia, the forward camp moved with it, thus putting 120 miles, over extremely bad mountain roads, between the two elements of the section. Four more drivers, with vehicles, were obtained but, nevertheless, a severe strain was put on transport, which was required to transmit correspondents' copy from the front to Palermo, sometimes twice daily. Palermo was the transmission point from which copy was flown to Algiers. A courier system had been planned by higher headquarters, but failed to materialize.

Thought was given to consolidating the entire section at the forward camp, but practical considerations made this impossible. It was found that administration of the Section, arranging of transportation for correspondents to and from Algiers, and frequent newsworthy occurrences at Palermo made it essential to keep a Public Relations unit there.

While at Nicosia, an expedient Cub airplane service was organized to fly urgent copy from the 3rd Division, on the north coast, to II Corps. Along with copy from the south front, this was then flown to the Syracuse area, from which it was taken to Malta by the RAF for cable and radio transmission. Photographs, broadcast copy and magazine features still had to be sent back through Palermo to Algiers. When II Corps moved to the vicinity of Cesaro, liaison problems along the front, and to Palermo, became critical. The use of Cub planes, however, proved extremely successful and relieved the situation.

By the time the 3rd Division had moved up to the vicinity of Barcellona, it was apparent that the final push was to be made by that Division. Consequently the PRO forward camp was split, part remaining at II Corps and the rest, along with most of the correspondents, shifting to the 3rd Division. Correspondents and conducting officers then worked forward, using five Cub planes and one C47 on the last day to clear the story of the fall of Messina. Higher headquarters said the speed with which the Messina story was dispatched set a record for such operations.

COMMUNICATIONS

Communications are the toughest problem and at the same time the most important factor in Public Relations field operations. The Sicilian campaign--characterized by rapid movement, poor roads, few airfields and constant shortages of all types of transportation, complicated by the relatively large number of correspondents, made it a severe test. It is doubtful whether any future operation of an Army in Europe will be more difficult from a Public Relations standpoint.

During the initial landings some copy was sent back to Algiers via Tunis by boat. This copy, since no courier was available to accompany it, was slow in reaching the cablehead. The next two pouches were sent with broadcast correspondents and rade better time. From then on, copy was dispatched by 7th Army courier, hospital planes, returning correspondents and other expeditious means. None of these methods were satisfactory, some copy arriving in Algiers as much as five days late.

During the period from the landings until the movement to Nicosia instructions were given by higher headquarters to meet an RAF courier plane, supposedly landing daily at Palermo. It was never possible to contact this plane which, it was learned later, made only one trip to Palermo, on which the pilot landed and took off without making contact.

Then the Cub plane service was established, artillery observation pilots cooperating splendidly. The Cub service augmented motorcycle and 1/4-ton couriers who were in constant use throughout the campaign. Personal liaison by the Public Relations Officer and the Executive Officer was essential, even though it required them at times to drive 250 miles over rough mountain roads in a day. This liaison coordinated Cub couriers, whose landing fields shifted almost daily, and maintained contact between the Public Relations base at Palermo and the advance camp. No other means of communication functioned satisfactorily.

Despite these difficulties in transmission, the two biggest stories of the campaign were cleared in record time. The first prime story was the fall of Palermo. A party of correspondents accompanied the commanding general into the city at the surrender. Complete photographic and eye-witness coverage was provided. One correspondent was flown back to Agrigento by Cub plane, and thence to Algiers by a bomber furnished by the XII Air Support Command with the first film and news copy. At Algiers he broadcast his eye-witness account direct to the United States. Photographs were radioed and published in American newspapers the day after Palermo fell.

The Messina story was handled with even greater efficiency and speed. Correspondents wrote their stories when patrols entered Messina and the first Allied artillery opened fire on the Italian mainland. This copy, with pictures, was flown by Cub that night to Syracuse and forwarded by another plane at 0730 the next morning. A second Cub brought out stories of the occupation of Messina at 1030, the copy being routed to Malta.

At 1530 still more detailed accounts and pictures were sent, broadcasters couriering them by Cub to Palermo. With the 7th Army Commander's permission, the broadcasters were put aboard his plane at Palermo and flown to Algiers, arriving at 0015. They started broadcasting to the United States one hour later, with the result that eye-witness accounts of the Messina occupation were heard in America the same day.

Attempts were made early in the operations to send short dispatches by tactical radio from 7th Army to higher headquarters, but the press of tactical traffic burdened this channel and such transmission of news was abandoned.

The campaign made it apparent that an Army in the field could not expect to provide and maintain communication channels for press copy and film beyond the Army's area. From that point, responsibility for efficient, prompt relay would rest with higher headquarters.

Although artillery sections, in providing Cub couriers, cooperated without a single slip-up, it could hardly be expected that they would always be equally efficient. Putting planes under direct control of Public Relations would ensure reliable service in future operations.

The maintenance of constant liaison by Public Relations Officers, laterally and in depth, is absolutely essential. It also is necessary to provide motorcycle and other transport for fast couriering by road.

The notable success of communications during the latter part of the campaign was made possible largely through the efforts of one officer who spent his entire time finding means of expediting copy and meeting the tricky problems created by changing transmission conditions. It is felt that communications are so important that maximum efficiency can not be obtained in future operations unless two officers are assigned to do nothing else but keep copy moving.

Radio transmission of news copy was almost negligible and it is impractical to hope to impose upon tactical radio the additional burden. Only rarely will such transmission be as fast as air courier. If, however, radi. transmission is to be undertaken, transmitters and operators should be provided to Public Relations for this specific work. But regardless of what radio facilities are provided, fast, dependable courier service by road and air to cableheads must be available.

TRANSPORTATION

Higher Headquarters improvised and authorized a table of basic allowances for the Public Relations Section about three months before the Sicilian operation began. The same Headquarters agreed voluntarily to fill the table, to provide vehicles and mess equipment--all of which was to come from the Public Relations pool. Part of the equipment used in Tunisia was to be provided. But, about a month before the operation, information was received from the Public Relations Branch that it would be unable to provide ANY vehicles or equipment. The 7th Army had no TBA for drawing the equipment. Higher Headquarters later authorized the drawing of five 1/4-ton trucks, three motorcycles, one 3/4-ton truck and one 2 1/2-ton truck.

Such vehicles were then at a high premium and, because of the delay in their authorization, it was too late to include these vehicles in the loading schedules except by finding space for several at the last minute. G-4 supplied all the vehicles before Headquarters left Mostaganem and space was found to load two 1/4-ton trucks, the 3/4-ton and one motorcycle on the command ship. This was the only transportation the Section had when it began operating in Sicily.

Upon reaching Agrigento, the Section received another 1/4-ton and trailer from Higher Headquarters. However, the vehicle was accompanied by nine more correspondents, which made the long trek to Palermo even more difficult. The nine finally were transported across Sicily in a borrowed truck and later shuttled to the advance camp at Cefalu.

A few days later, three more 1/4-tons arrived from Africa. These were vehicles which the section had not been able to ship on the D Day convoy. This brought the total to seven, but the number of correspondents by this time was fluctuating between 26 and 30. Shortly before the campaign ended, two more 1/4-tons arrived and, with a number of correspondents leaving, pressure was relieved. In the final week, adequate transportation was available.

Enlisted men needed as vehicle drivers, mess sergeant, two cooks, a clerk, a mechanic and four basic privates for the forward camp; and a chief clerk and a clerk at the base headquarters. This calls for total personnel of six officers and 29 enlisted men.

A recommended T/O is attached.

With the exception of a clerk who arrived late, every enlisted man and officer in the Section was under fire at some time during the operation, and performed as a soldier should. All personnel was given the opportunity to spend considerable time at the front.

CORRESPONDENTS

The correspondents who covered the Seventh Army operation were an all-star group.

On the command ship were Hal Boyle of the Associated Press, who has made a name for himself since the African invasion as the hardest working and most conscientious reporter in the theater; and Alex Clifford of the London Daily Mail, a brilliant young Englishman of great journalistic eminence in his own country, who has spent three years, beginning with the Battle of France and continuing through the Balkans, Greece, Crete and the Western Desert, covering the war from the standpoint of a highly literary student.

On other ships of the D convoy were these: Jack Belden of Time and Life, who went through the Burma campaign with General Stillwell, Chris Cunningham of the United Press, veteran of the Tunisian campaign; Clinton Green of International News Service; Don Whitehead of the Associated Press; Charles Corte of Acme Newspictures, and Jack Barnet of Fox Movietone, both veteran photographers of the war in Tunisia; John Thompson of the Chicago Tribune, who jumped on the night before D day with the parachutists; and Robert Landry, Life photographer. There were also three enlisted Stars and Stripes reporters, who turned out to be excellent writers and industrious front-line soldiers.

Ashore from the Navy came six additional correspondents: H. R. Knickerbocker of the Chicago Sun, considered among the top-ranking few best war correspondents; Clark Lee of Bataan fame, working for the International News Service; Michael Chinigo of the same agency; Ernie Pyle, now probably the best-known correspondent of this war; Robert Capa, perhaps the best of all war photographers, who arrived working for the photo pool but was accredited during the campaign to Life; and 2nd Lt. James A. Burchard of Stars and Stripes, formerly a well-known member of the New York World-Telegram staff.

Later in the campaign others were added: Dick Tregaskis, of International News Service, whose book, Guadalcanal Diary, is a best seller. Fred Painton, veteran of the last war and writer for Readers Digest. Questin Reynolds, well known for his articles in Colliers, not to mention his latest best seller, Dress Rehearsal, the story of Dieppe. Demaree Bess, considered the shrewdest of all the foreign political writers, representing the Saturday Evening Post. Irving Smith, Universal Newsreel cameraman who landed at Fedala and stayed through the Tunisian campaign. Mark Watson, editor of the Baltimore Sun. Bob Wallace, photographer for Look Magazine. Mike Ackerman of Acme, dean of American news cameramen. Ivan Dmitri, famed for his color pictures in Life and Saturday Evening Post. Merrill Mueller of Newsweek and the National Broadcasting Company. Al Newman of Newsweek. Charles Daly of the Columbia Broadcasting Company. Farnsworth Fowle, also of CBC. Ralph Howard Peterson of NBC. Sam Shere of Life. John Hersey of Time and Life. Herbert Matthews of the New York Times. Homer Bigart of the New York Herald Tribune. Tom Treaner of the Los Angeles Times. Dick Mowrer of the Chicago Daily News. The Public Relations Branch at Algiers reported that, in general, the correspondents were well satisfied with the conduct of public relations in Seventh Army.

Time Magazine, which in the past has been sharply critical of Army Public Relations, said in its July 26 issue, page 27:

"The historic invasion of that historic island (Sicily) was more thoroughly reported, by correspondents with the invaders, than any military operation of World War II."

And on page 58 of the same issue:

"For once, Americans had all the copy they could read about an Allied move. The copy was slow getting under way, but within 24 hours after the troops were on the beaches, it was spinning through OWI's Washington headquarters, from Sicily, from the invasion fleet, from Allied Headquarters in North Africa... The result was the best war coverage Americans had yet had."

RECOMMENDATIONS

One of the principal faults of organization of the Public Relations Section of Seventh Army was the delay with which the section was implemented with equipment and vehicles.

The basic policy of higher headquarters for operation HUSKY was that Public Relations be centralized in that headquarters, with personnel and equipment provided to the field army from a higher headquarter's pool. This would have proven satisfactory if personnel and equipment had arrived at tactical headquarters in time to be included in loading schedules.

The answer seems to lie in the building of a strong, well-equipped organic section in the Army itself, to which higher headquarters can send supplementary personnel and equipment. This organic section should be in a continued state of preparedness on a footing, even during quiescent periods, which will enable it to be incorporated in the original loading plans, and to enter an operation organized and equipped for maximum efficiency.

There is no more reason why a Public Relations Section should be disbanded between operations than for an infantry platoon to be inactivated. Public Relations personnel must be highly specialized and is hard to find. Once procured, it should be kept intact.

Conclusions:

Transportation and communications go hand-in-hand as the two all-important essentials. Efficient operation of Public Relations requires that transportation be available for all correspondents to perform their legitimate missions. It also is necessary to have enough of a reserve to take care of maintenance, which, experience shows, will keep from 10 to 20 per cent of the Section's vehicles deadlined.

Not less than a dozen 1/4-ton trucks should be available at the very start of the operation such as the invasion of Sicily. The 3/4-ton and the 2 1/2-ton trucks are invaluable for transporting rations, mess equipment, water, baggage, etc. The motorcycles are absolutely essential for courier service.

It has been pointed out that maximum efficiency requires that two Cub planes be assigned to public Relations, primarily for use in carrying copy to transmission points, and also available in special cases to fly correspondents to critical areas.

A tabulated recommendation on transportation is attached.

OTHER EQUIPMENT

It was expected that correspondents would be based at Army Headquarters, and the Higher Headquarters would later ship equipment and personnal for a separate mess. But it was quickly seen that basing correspondents at Army Headquarters was impractical. Therefore, a mess was hurriedly organized, using borrowed and seized equipment. This was supplemented gradually until an efficient mess was assembled. Acquisition of a dozen German Army cots and a few folding cots solved the problem of billeting correspondents.

In future operations, adequate kitchen facilities should be provided at the outset and tentage should be available for inclement weather. Two CP tents and one pyramidal were used as blackout tents in Sicily for correspondents to work in at night when buildings were not available.

A proposed TBA for camp equipment is attached.

PERSONNEL

The Public Relations Section had four officers on the D day operation. They were dispersed, as experience in the Moroccan campaign had shown was best, with the sub-task forces, each conducting a team of corrrespondents, providing comprehensive couverage of the operation. In addition, the service of the Public Relations Officer of the Second Armored Division was obtained to escort a team with his headquarters. This was necessary because of the lack of other personnel.

Midway in the campaign one officer was evacuated because of malaria and two new officers reported from Higher Headquarters. One arrived, ill with malaria, and was returned at once. The other was ill for the first five days and was able to be on duty only a few days late in the campaign. The net result was that, except for about ten days, the Section operated with only four officers --too few to do a proper job.

Six officers should be the absolute minimum for efficiency in such a campaign. And this does not take into account the ever-existing possibility of illness or casualties from enemy action. But it would provide a Chief-of-Section, executive, camp commandant and transportation officer and communications officers.

PROPOSED TABLE OF ORGANIZATION

Forward Echelon

1 Major, commandant and forward executive.
1 Captain, communications officer.
1 Lieutenant, assistant communications officer.
1 Lieutenant, relief and transportation officer.
1 Technical sergeant for first sergeant
1 Mess Sergeant
1 Motor sergeant - Mechanic
15 Drivers
3 Motorcycle riders.
2 Cooks
4 General duty enlisted men.

Base Echelon

1 Lieutenant Colonel, Chief of Section.
1 Captain, base echelon executive
1 Technical Sergeant, chief clerk.
1 Technician fourth grade, stenographer and assistant clerk.

Recapitulation

1 Lieutenant Colonel	2 Technical Sergeants
1 Major	1 Staff Sergeant (Mess)
2 Captains	2 Sergeants or T/4's
2 Lieutenants	4 T/5's
	20 privates
6 Officers	29 Enlisted Men

Attached During Combat Operation

2 pilots.

PROPOSED TABLE OF TRANSPORTATION

The following table of transportation for a Public Relations operation such as the Sicilian campaign required is proposed:

	Attached
12 - 1/4 ton trucks	
1 - 2½ ton truck	2 - light planes
1 - 3/4 ton truck	
3 - motorcycles	
1 - 1/2 ton trailer	
2 - 1/4 ton trailers	
1 - small water-trailer	
1 - small air compressor	
Tools for minor maintenance	

PROPOSED TABLE FOR CAMP EQUIPMENT

20 - small wall tents
4 - pyramidal tents
2 - command post tents
2 - kitchen flies
1 - field range
3 - ground type burners
Kitchen equipment adequate to feed 60 persons in emergencies, or 50 regularly.
1 - small generator for lighting
30 - camouflage nets
50 - folding cots
30 - folding tables.

JOHN H. HUTCHISON
Major, Infantry
Public Relations Officer

REPORT OF THE SPECIAL SERVICE OFFICER

The Special Service Section found the beginning of the planning and preparation phase to be very similar to the period preceding it. The recreation programs set up in Casablanca, Rabat, Safi, Port Lyautey, Fedala and Guercif, consisting of ten clubs and four theaters that had been opened and turned over to the American Red Cross for operation, and organized recreation and athletics and outdoor movies in the bivouac areas were continued in good effect. All divisions and units assigned to I Armored Corps had been adequately supplied with athletic equipment ("A" kits) but there was a great shortage of radio-phonograph combinations ("B" kits) which had been distributed on the basis of approximately one-third of the authorized allowance. Seventy-five large field radios, operated by storage batteries, had been secured and distributed. It was recognized that the units engaged in the Tunisian Campaign would be assigned and that normal and battle loss replacements of equipment would be necessary. A reserve supply was started to meet this requirement by setting aside one-half of all supplies received and with the excess athletic equipment of the units and divisions in the Rabat Area. Planning for future supplies was coordinated with the Special Service Sections of NATOUSA, Atlantic Base Section, Mediterranean Base Section and Eastern Base Section.

As the headquarters moved east the recreation program was enlarged in scope with the addition of programs in Oran, which had already been well set up for entertainment and facilities by the American Red Cross and at Mostaganem where Special Service operated a theater and a bathing beach. The Red Cross operated four clubs, two restaurants and three theaters in

Special Service Officers of all units were informed that it would be very improbable that supplies would be available in the quantities required and were instructed in setting up a special improvised bivouac recreation and athletic program that could be made up with items normally carried by the men in their combat packs, regular supply room items, or that could be obtained from the natural features of the bivouac area.

There was a definite need for the assignment of Special Service companies. The company consists of five officers and one hundred and nine enlisted men. Normally comprising four platoons and trained as infantry it is designed to function either as a company or as separate platoons, each capable of establishing a complete recreation center with athletic, musical, theatrical, radio, library, motion picture, canteen and exchange facilities. The company has organic transportation. The required assignment of companies would be one per division and two to Army headquarters under the supervision of the Special Service Officer for use in smaller unit bivouac areas. Although request was made for assignment of companies of this type they had not arrived in the theater prior to departure of the Section from Africa.

The Section moved from Mostaganem to Bizerte where it established and operated beach clubs, one for officers and one for enlisted men. It was instrumental in securing and opening a club and theater under the operation of the Red Cross. Conducted tours to historic Carthage were instituted. The history of the Section in Africa leaves a trail of clubs and theaters from Safi to Bizerte, with the main programs of recreation (including unit day rooms), athletics and movies installed in bivouac areas.

The Section was also assigned the task of handling Expeditionary Force Messages for the Army troops. While the messages were of the "canned" type which is not especially desireable, they did provide a rapid means for communicating with the United States.

In preparation for the water phase where troops would spend many days aboard ship division and unit Special Service Officers were provided with books, small games and playing cards to distribute for the recreation and entertainment of troops. It was considered impractical to attempt to install movie shows aboard.

The Stars and Stripes newspaper did much towards the maintenance of morale and arrangements were made to have the Algiers edition provided to troops in Sicily. The newspaper was distributed free of charge in all combat zones, and was later set up in printing plant in Palermo issuing two Sicily editions each week and a reprint of the Algiers weekly edition.

The American Red Cross played a large part in the Special Service program providing field personnel to assist the soldier in welfare problems and club personnel to operate the numerous clubs. The field personnel in Sicily consisted of forty field directors and seven hospital women. Four men were assigned to Army headquarters, four to each division and two to Corps headquarters with others assigned to various air corps groups. One woman was assigned to each of seven hospitals. The men assigned to the combat teams of the divisions came ashore with the initial assault and, during the initial phases, concentrated their efforts in supplying patients at clearing stations and evacuation hospitals with necessary comfort items. There were six women and four men engaged in club work operating a beach club and a city club in Palermo that were obtained by the Special Service Section. Nine clubmobile workers were operating three mobile clubs in the bivouac areas. Clubs were planned for Cefalu, Termini and Trapani for operation by the Red Cross and request for the necessary personnel had been forwarded.

Special Service facilities were made available to troops during the battles as far front as the reserve regiments. Outdoor movies were provided in all areas where permitted. It is estimated that the movie attendance at these shows during July was 600,000 and 1,020,000 during August.

An American Expeditionary Force radio program commenced operation over Radio Palermo on 11 August 1943 with sufficient power to reach all of the island and the Italian mainland. The program was scheduled for one hour daily, to be expanded at a later date upon arrival of equipment necessary to install a separate station.

Plans were made for each division, upon being withdrawn from the forward areas, to set up installations of bathing beaches, movies and enlisted men clubs within their respective areas.

The Special Service Section obtained a theater in Palermo and operated four shows daily showing to a total of 2000 men each day.

CONCLUSIONS:

Control over small units, especially artillery and coast artillery is lacking in Special Service activities due to the failure of the brigade T/O to provide a Special Service Officer although one is provided for a regiment.

Special Service supply during the campaign was far inadequate to meet the minimum needs of the troops.

SECRET

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

REPORT OF THE CHAPLAIN

Army Special Service should be set up as an operative rather than an administrative section.

RECOMMENDATIONS:

That the T/O of a brigade call for a full-time Special Service Officer.

That the T/O for Special Service Sections be amended as follows:

	Army	Corps	Div.	Brig.	Regt.	Bn.
Colonel	1					
Lieut. Colonel	1	1	1			
Major	1	1				
Captain	2		1	1	1	
Lieut. (1st or 2nd)			2			1
	5	2	4	1	1	1
Master Sgt.	1					
Tech. Sgt.	1	1	1			
Staff Sgt.	1			1		
Tech. 4th gr.	3	3	3		1	
Tech. 5th gr.	6	3	3	2	2	2
Private 1st cl.	2	3	3	1	1	
	14	10	10	4	4	2

That Quartermaster or courier supply channels be used for shipment of Special Service supplies.

That all units be supplies with "A" (Athletic) "B" (Recreation) Kits in accordance with authorized allowances immediately and that a sufficient supply be carried on hand at Base Sections to equip units activated in the theater and for normal and battle loss replacements.

That T/B/A be set for Special Service equipment as follows:

	Army	Corps	Div.	Brig.	Regt.	Bn.
Projector, 16 mm	6	4	2	1	1	1
Projector screens (large outdoor)	6	4	2	1	1	1
Proj. repair and rewind kits	6	4	2	1	1	1
P. A. Systems W/ record player:						
50 Watt	2	1	1			
20 Watt	2			1	1	
Films, 16 mm	50	25	25	10		
Generators, 5 KW	2	2	2	1	1	1
Radio (all wave) (Bat.-AC-DC)	4	2	1			
Truck, 2-1/2 T	2	1	1			
Truck, 3/4 T	1	1	1	1	1	
Truck, 1/4 T	2	1	1	1	1	
Trailer, 1 T	2	1	1	1		
Trailer, 1/4 T	1				1	

That one Special Service company be assigned to Army headquarters and one company to each division under the control of the Special Service Officer.

LESSONS LEARNED:

That it is impossible to control shipments of Special Service supplies unless a specific channel is set up in order to place responsibility for safe delivery. Control of shipments from Bizerte arranged by the Special Service Office by utilizing empty trucks of Quartermaster and Field Artillery units was excellent and the shipments were received in Sicily intact. Shipments which were made after the Section left Bizerte and which were loaded in bulk on LST's were difficult to handle and were received incomplete. Shipment of supplies through Quartermaster channels or under the care of a courier would provide the necessary guidance for proper arrival of the shipment at Special Service.

1. Shipments of Special Service supplies are difficult to control with limited personnel. They should flow with the normal Quartermaster supplies.

2. It is necessary to furnish guards in all shipments to prevent looting.

3. Empty vehicles of units can be utilized for shipping Special Service Supplies.

4. Increased personnel are necessary to guarantee proper distribution and safe arrival.

Kenneth E. Van Buskirk
KENNETH E. VAN BUSKIRK,
Lt. Col., Field Artillery,
Special Service Officer.

During the planning period for the Sicilian campaign, the Chaplains of this command carried on the performance of their normal duties. One of the principal problems was to procure additional chaplains to fill vacancies in various units of this command. The Chaplain's office was moved with the rear echelon to Oran, Algeria on April 29th where steps were instituted to obtain the necessary chaplains. There was a shortage of chaplains in the African theater. In making recommendations for transfer and assignment of chaplains, priority was given the existing vacancies in combat units. Effort was made to place the young and vigorous chaplains in combat units and older men in non-combatant units. Requests were also made for a chaplains pool in accordance with War Department directives to provide the services of chaplains for troops in units having none authorized by Tables of Organization. This personnel was not obtained.

Typical religious schedule of services conducted during the planning phase are illustrated by Annexes #1 and 2, for Easter Sunday, April 25, and June 6.

During the tactical operation of the campaign, in addition to performing their normal functions, the chaplains, in many cases, assisted the Graves Registration Officer by combing the battlefields for the dead and transporting them to various places for burial. A considerable portion of their time was devoted to this activity at the expense of active soldiers where they could have been more helpful in maintaining the morale of the command.

Typical schedule of services conducted during the operational phase is illustrated by Annex #3 of August 22. Summary of chaplain activities is illustrated by compilation of Monthly Report of Chaplains dated September 14, Annex #4.

One of the greatest handicaps the chaplains found for the successful performance of their duties was the lack of transportation.

Noel T. Adams
NOEL T. ADAMS,
Chaplain, Major,
Seventh Army.

ANNEXES

**** RELIGIOUS SERVICES ****
(for Easter Sunday, April 25th)
Rabat, French Morocco

CATHOLIC

St. Pierre Cathedral..... Near Chamber of Commerce Bldg.
Masses at: 0700, 0800, 0900*, 1000, 1115
* Mass by Army Chaplain

Confessions at Cathedral from 1600 to 1900 Saturday, by English-speaking curates. (First confessional boxes on left and right)

Notre-Dame Des Anges..... Aquedal, near Rue L'Ariege & Rue La Marne.
Masses at: 0800, 0900, 1000, 1115

St. Francis..... Next to Red Cross Service Center on Rue de La Marachale.
Masses at: 0730, 0830, 1000, 1100

CHRISTIAN SCIENCE

1100.....Red Cross Serv. Ctr., in the wicker room to the rear of the bldg.

PROTESTANT

0700..... Easter Sunrise Service at Red Cross Service Center.

0930..... For Special Troops in I Armored Signal Area.

1100..... At Red Cross Serv. Ctr. (Conservatoire de Musique), on Rue Lasvigne, one block to the rear of Rennaissance Theater.

1430..... At 760th Tank Bn. Area.

1700..... At Red Cross Serv. Ctr.,.....Vesper Service.

LENTEN SERVICES:
CATHOLIC: At the Cathedral nightly, at 1830.
GREEK ORTHODOX: Church in Bab Tamesma Place, U.S. Army Route #1, at the end of Avenue De Temara. Each evening 1800 to 2000, and Good Friday at 1330.

JEWISH

Passover Morning Services, April 27th, will be held at the Red Cross Ctr. from 0900 to 1200.

*** RELIGIOUS SERVICES ***
(for Sunday, June 6th)

ORAN AREA

CATHOLIC: 1100 - American Red Cross, Empire Theatre
The following churches hold Mass at: 0600, 0700, 0800, 0900 and 1030:
Cathedral, Place Jeanne d'Arc, Bd. du 2nd Zouaves
St-Louis Church, near Military Hospital
St-Andre, Place Ben Daoul

Confessions: 1700 - Saturday, Chaplain's Office, 4 Bd. Clemenceau
1030 - Sunday, American Red Cross, Empire Theatre.

PROTESTANT: Services at 1100 in the Auditorium of Hqs. Bldg. (Rear Echelon)
Evening Vespers at 1900.
Devotions and Meeting of Service Men's Christian League on Tuesday evening, June 8th, at 1900.

OTHERS: 0815 - Episcopal Communion, Chaplain's Office, Ecole Pasteur.
0830 - Holy Communion(Sunday and Daily) Chaplain's Office, 4 Blvd. Clemenceau.
1000 - American Red Cross, Empire Theatre.
1000 - Methodist Church(French)-Blvd. des Chasseurs & Rue d'Arzew.

JEWISH: 0900 - Sunday - American Red Cross, Empire Theatre.
1830 - Friday - Synagogue, Bd. Jeffre and Rue Magenta.
(Above services are conducted by U.S. Army Ch.)
1900 - DAILY - Synagogue.

CHRISTIAN SCIENCE: Services every evening in the Chaplain's Office, 4 Blvd. Clemenceau at 1930.

MOSTAGANEM AREA

PROTESTANT: 1030 - Sunday - Red Cross Theatre, off the Square in Mostaganem.
1300 - Sunday - Surgical Area, 40th Station Hospital.
1900 - Sunday - 40th Station Hospital Detachment Area.

CATHOLIC: Saturday - 1700 to 1900-Confessions in Church on Sq., Mostaganem.
Saturday - 1930 to 2030-Confessions in Ch. Room, 40th Sta. Hosp.
Saturday - 1700 to 1800 - SSO Office, I Armd. Corps, Ch. DeMars.

Sunday Masses

0715 - In the Surgical Area at the 40th Station Hospital.
0630, 0730, 0830*, 0900, 1030 - Church on Square in Mostaganem.
(* 0830 Mass will be said by an Army Chaplain)
Confessions will be heard before the Mass in Church.

JEWISH: Tuesday - 1900 - Surgical Area, 40th Station Hospital.
(Service conducted by an Army Ch.)

*** RELIGIOUS SERVICES ***
(22 August 1943)
Palermo, Sicily

CATHOLIC SERVICES

San Domenico Church - Via Roma (1 block east of Post Office Bldg.)
Masses at: 0700, 0845, 1000* and 1100*(*Masses by U.S. Army Chaplains)
Weekly Masses each morning at 0700 by Army Chaplain

Cathedral - Via Victor Emanuele at Archway.
Mass at: 0900 by Chaplain DeMars.

Regina Pacis Church - West side of Palermo, near 540th Engineers.
Mass at: 0900 by U.S. Army Chaplain

St. Theresa Church - Via Fillippo Parlotore & Via Dante, near 68th C.A. and 201st Ordnance Depot
Mass at: 0900; Confessions: 0800 - 0900 by U.S. Army Ch,

Other Masses by Army Chaplains:
1000 at 91st Evac. Hosp.; 1700 at 343rd Bivouac Area.

Confessions: Before all Masses held by Army Chaplains.
Also, at 0900 to 1100 and 1430 to 1800, August 21st, in Chaplain's Office (Main Hqs, 7th Army - 4th Floor)

FOREWORD

Any effort to record a succession of many events, regardless of how closely these events may be related, can result only in a partial and incomplete history. Even though the writer adheres faithfully to the existing documents, contemporary to the events described, and eliminates errors of memory and bias on the part of individuals participating therein, gaps will be bridged. Available documents, such as plans and orders, may have been executed wholly, in part, or not at all. Plans and orders are but a means to the all important end — execution. Under stress of a rapidly moving campaign, continuous and accurate evaluation of situations must be made as they arise, and success hinges on alertness and speed in exploiting an advantage or retrieving a disadvantage. In this control and direction of execution, it is but logical to expect that much of the action is initiated and often changed by decisions and orders transmitted orally on the spur of the moment, and of which no record is practicable.

Throughout its campaign a small group of the Seventh Army Staff worked at scanning source material with the object of producing a continuous narrative. Upon leaving the Mediterranean Theater and coming under the Supreme Allied Headquarters, the narrative history was for some months subordinated to the production of small unit action reports — brief factual reports involving regiments, battalions and companies. While such reports are invaluable for study in the Service Schools, it was realized that they do not afford a substitute for narrative, at Army level, and work on the narrative history was continued.

It is not the object of this history to enhance either the reputation of the Seventh Army or of any individuals in that Army. It is being published to provide a record of the campaigns of that Army, as accurate and unbiased as possible, and not omitting inevitable mistakes and difficulties that may have occurred. Emphasis has been placed on the tactics of the campaign, supply being less thoroughly covered, although there are chapters on supply for each phase of the book. Absence of more detail regarding supply must not be inter-

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

preted as a lack of appreciation of its importance. Never was a campaign so dependent on supply for success. To say that the functioning of the supply agencies, under supervision of the G-4 Section, was less than brilliant would be an error. The obstacles overcome by them, at times, seemed insurmountable but were never accepted as such.

Since an account of action can be followed accurately only by having both text and maps simultaneously visible to the reader, maps have been arranged so as to provide that convenience.

To fill in some of the gaps in the record and to prevent erroneous conjecture on the part of the reader, the following facts should be remembered:

1. In the landing on the shores of South France tactical surprise was attained as a result of careful planning, including numerous diversionary operations. Therefore the Seventh Army attained the desired goal — a landing with a minimum of opposition.

2. Rapid exploitation to the north from the beachhead was no accident. Based on the mission and experience learned in landings previous to this one, it had been determined during the planning phase that the force would exploit rapidly out of the bridgehead and up the Rhone to contact American forces landed in Normandy just as quickly as opportunity offered.

3. A policy of unremitting pressure to keep the enemy off balance was maintained throughout the campaign, even during the temporary partial stalemate in the Vosges.

4. In general offensives, the staggering of attack dates for the various components of the Army was done for the purpose of forcing and taking advantage of ill-timed shifting of enemy front line units and reserves.

5. Long range planning in anticipation of possible as well as probable contingencies and developments was the rule.

6. In the final phase beginning 15 March 1945, close liaison between the Seventh Army and the Third Army on its left resulted in harmonious cooperation and teamwork.

Arthur A. White

ARTHUR A. WHITE
Major General, USA
Chief of Staff, Seventh Army

PREFACE

This document professes to be a narrative military history, something more and something less than the usual report of operations. It is not a compendium of reports submitted by various sections and organizations of Seventh Army. The complete data of an army report, have been forwarded to higher headquarters as annexes and Staff Section Reports. The basis for this history is a selection of material from reports submitted, verified and coordinated with information obtained from other primary sources at both high and low military level.

The original manuscript, from which this document was published, is the After Action Report of the Seventh United States Army in France and Germany which is on file at the War Department. It is fully annotated with complete references to the above mentioned source materials.

It is felt that this history is as accurate as any published within the space of one or two years after the events described. It represents an effort conceived before the beginning of the operation to prepare an historical military narrative. A system of checks and balances was conscientiously employed to find the truth. Close examination of place, time, and logic give the key to many confusing situations. However, when reasonable doubt exists, an attempt is made in this text to indicate the full cycle of reports and to point only to what seems the probable conclusion.

Any text can be authentic only in so far as its sources are authentic and in so far as the persons who compile it do so with integrity. The sources for this history fall generally into two categories: one, reports submitted through the historical section by units within the army and reports of the army staff sections; two, independent research and interview sources. Full credit should be given to unit historians who accumulated the data which form the basis of this account. Their efforts to prepare historical reports of unit engagements, usually in addition to other duties, represent a prodigious achievement.

From these unit reports research writers in the historical section, selected for special abilities in writing or scholarship, prepared their text. They are the men responsible for the accuracy of selecting and recording detail and for whatever interpretation might be necessary. Fortunately the historical section had available for check and balance the work of a group known as

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

combat historians. These men collected and collated information about significant engagements within a few weeks following the action by means of interview with those who participated in the engagements and by checking terrain and report at first hand. Their reports on small unit actions were valuable in the clarification of engagements, as a check against unit reports. The data of small unit actions have added detail to the narrative and have assisted in the focus of emphasis on the proper places.

The maps and charts in this history are the work of a group of cartographers who collaborated with research and editorial sub-sections in producing a visual record which would supplement and be supplemented by the text. Photographs are for the most part selected from Signal Corps files, although some special work in photography has been done by the historical section. The production group, responsible for turning the manuscript into a book, has supervised publication with a purpose in accord with that of the section: to present a serious, dignified, readable, historical account of Seventh Army operations.

The historical section, during operations, was a detachment of the 6th Information and Historical Service, attached to Seventh Army for the purpose of compiling the historical data for the Army and writing the After Action Report of the operation.

Historians sometimes doubt the validity of history published immediately in the wake of events. It is recognized that five or ten years from now a more dispassionate, more interpretative history may be prepared. However, it is felt that this history has a double value. In the first place it represents the first of secondary sources for the possible history of the future. It is an attempt to give permanence and form to a record which might otherwise be lost or buried. In the second place, this history has now an immediacy which can never be recaptured. It is hoped that this document contains a warmth and fire and a sense of presence too often lacking in history. This can only be accomplished by working in the lights and shadows of the military campaign.

In addition to the above named personnel there were the Combat Historians and other members of the administrative section, officers and enlisted men, who constituted the rest of the Seventh Army detachment of the 6th Information and Historical Service. They, too, made a sizeable contribution to the narrative history. Then there were the photographers of the 163rd Signal Photo Company and the Army Pictorial Division and the officers and enlisted men of the 3060 Engineer Topographic Company who, by their conscientious work and special abilities, added to and aided in the clarification of the finished narrative. And most important of all were the men who carried out the combat operations of Seventh Army, whose actions are herein recorded although too often concealed in anonymity, without whom there would be nothing to write. It is impossible to give proportionate credit to all.

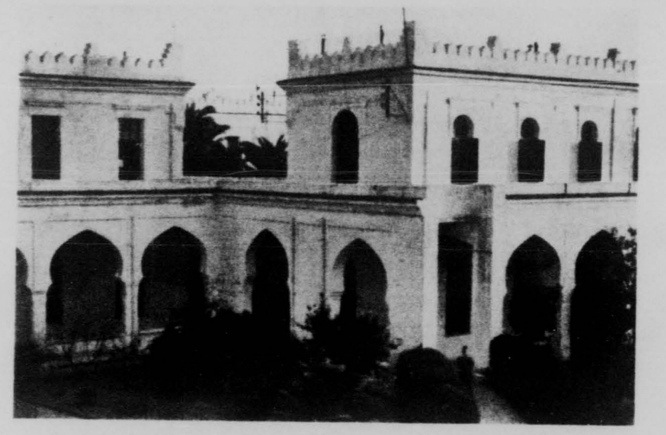
CHAPTER I

Preliminary Planning

ON 19 December 1943 Seventh Army Headquarters in Palermo received a message which interrupted a four-month period of comparative inactivity since the end of the Sicilian campaign. It was a telegram from Allied Force Headquarters: "An estimate is required as a matter of urgency as to the accommodations which you would require for your planning staffs should you be asked to undertake the planning of an operation of a similar size to *HUSKY* . . ."

Since the capture of Messina on 17 August, which terminated the campaign in Sicily, the Seventh Army had been reduced from a tactical force of six divisions to a headquarters with a skeleton force of only a few remaining service units. In Washington and London the Combined Chiefs of Staff had made plans for an all-out offensive in the Mediterranean Theater to eliminate Italy from the war. As preparations for the invasion of the Italian mainland got under way, the 3rd and 45th Infantry Divisions, the 82nd Airborne Division, and most of Seventh Army's service units were assigned to the Fifth Army. At the same time the focus of coming events was also centered on the invasion of northern Europe. The 1st and 9th Infantry Divisions and the 2nd Armored Division were ordered to the United Kingdom for training as major assault units in the contemplated cross-channel invasion. What remained of the Seventh Army force bivouacked in and about the city of Palermo to continue its training and conditioning, as the headquarters went through a series of command post exercises and completed tactical and historical reports of the summer campaign.

Now an operation similar to *HUSKY*, which had hit the beaches of Sicily, was to be planned. During the last week of December



RESTRICTED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

preparations were made to move and organize the nucleous of a Seventh Army planning staff in the Ecole Normale at Bouzareah, just outside Algiers. Other units remained in Sicily and elaborate precautions were

THE ECOLE NORMALE OF BOUZAREAH IN THE CITY OF ALGIERS
now an operation similar to HUSKY which had hit the beaches of Sicily was to be planned

taken to prevent identification of the Bouzareah group with Seventh Army.

Instructions from Allied Force Headquarters to the planning staff on 29 December indicated general direction and objectives. The operation, which was to be known by the code name of *ANVIL*, would be launched with a target date during May 1944 against the south coast of France. In conjunction with the *OVERLORD* invasion of northern Europe, *ANVIL* was to establish a Mediterranean bridgehead and subsequently to exploit towards Lyon and Vichy. The forces involved were to be both American and French, although what the proportion was to be and what the total strength would amount to was as yet uncertain.

Lieutenant General George S. Patton was relieved from command of the Seventh Army as of 1 January. He was replaced by Lieutenant General Mark W. Clark, who still retained his Fifth Army command but was also charged with planning Operation *ANVIL*. Some five months were available for plans and revisions and for the organization and training of the striking force against Southern France. For initial consideration there was an Appreciation and Outline Plan previously prepared by Allied Force Headquarters.

AFHQ Appreciation and Outline Plan

In accordance with instructions, the Planning Group under the command of Brigadier General Garrison H. Davidson, Army Engineer, left Sicily and arrived in Algiers on 12 January to begin work. In General Clark's absence the first meeting was presided over by Brigadier General B. F. Caffey, G-3, Special Operations, AFHQ, who informed the group that the headquarters for planning Operation *ANVIL* had been designated as "Force 163". In the afternoon of the same day the various planning sections attended an orientation meeting at Allied Force Headquarters where G-2, G-3, G-4, Transportation and Air Corps discussed appropriate sections of the AFHQ Appreciation and Outline Plan. The discussion was brief and many questions were left unanswered.

The AFHQ Plan envisaged an operation against Southern France, early in May 1944, with a two or three division assault and a build-up to a total of ten divisions for exploitation northward. This, of course, was based on several assumptions: that the Mediterranean Theater would be burdened by no offensive operations other than the Italian campaign; that the internal security of North Africa would not be a limiting factor in the availability of American and French Divisions; that no amphibious operation would or could take place prior to the launching of *OVERLORD*.

The scale of the operation compelled the securing and early use of a major port. Toulon or Sete, to the west of the Gulf of Lions, might be temporarily used but only Marseille could be developed to

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

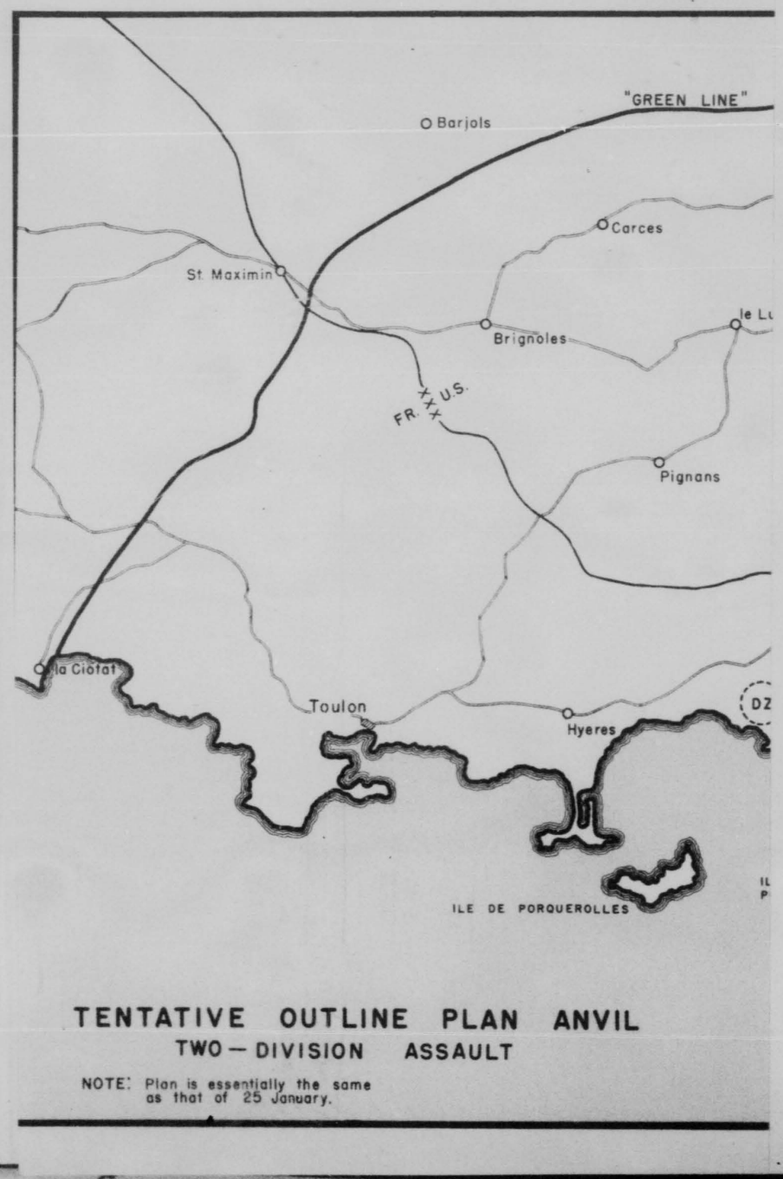
THIS PAGE IS UNCLASSIFIED

serve as a major supply base. In this same connection, the only beaches considered suitable were those southwest of Sete or those east of Toulon. It was also necessary to secure terrain suitable for the rapid construction of air strips so that fighter cover could be shore-based as soon as possible. The beach area east of Toulon in the vicinity of Rade d'Hyeres and Cavalaire Bay seemed to meet these requirements. It was fairly near Toulon and provided an anchorage for a large number of ships; moreover, the beaches themselves offered satisfactory gradients and good exits.

The assault was conceived with the likely prospect of a two-division lift, or three if available. In either case it was felt that the islands off the coast must be neutralized by Commandos or Rangers prior to H-Hour. The use of airborne troops to help extend the bridgehead and to prevent the rapid movement of enemy reinforcements into the target area was also recommended. Finally, the AFHQ plan suggested that the D-Day assaulting forces should be American with French follow-up troops who would begin landing on D plus 3. The capture of Toulon was to be the first major French objective, followed by the securing of Marseille and a general exploitation to the north.

As a counter proposal the planning staff of Force 163 recommended that the target area be shifted east of Cape Cavalaire in order to avoid an approach between the Islands of Porquerolles, Levant, and Port Cros. The towns of St. Tropez and St. Raphael, between Toulon and Cannes, might also be effectively exploited as small ports, and the terrain west of Frejus was suitable for the rapid construction of air strips. These, clearly, were alternative prospects.

Early Decision Impossible



It was inevitable that from the very beginning planning for *ANVIL* should be handicapped by stipulations, varying assumptions and special conditions. The number of assault divisions available, the build-up force to follow, the influence of the Italian Campaign, and likely objectives in southern France once a successful landing had been made were among the baffling questions yet unanswered. They could be answered only by the course of events elsewhere.

THIS PAGE IS UNCLASSIFIED

TENTATIVE OUTLINE PLAN ANVIL
TWO — DIVISION ASSAULT

NOTE: Plan is essentially the same as that of 25 January.

During these mid-January meetings in Algiers an amphibious operation known as *SHINGLE* was being mounted on the Italian coast in the Anzio-Nettuno area. The success of the Anzio venture would determine for some time to come the shipping and troops available for future operations. There was as yet no decision by the Combined Chiefs of Staff on the scale of *ANVIL*, nor even an approval of the general Outline Plan. Planning, however, went ahead on the basis of a one, two, or three-division assault with a seven-division follow-up. The supply sections began the preparation of logistical requisitions so that the loading of ships in the United States would not be delayed. Initial steps were taken to arrive at a tentative troop list.

Preliminary studies on the beaches, coastal defenses, terrain inland, and the disposition of enemy troops were made by the various sub-sections. In a note, however, which appeared in the Official Diary under 17 January an explanation of the slow, limited progress was offered:

> . . . . . At this time the plans for *ANVIL* are not very concrete. There are many questions and weighty decisions that must be made before any staff can logically plan the operation. Information obtained at the Allied Force Headquarters conference is that no word had been received from the combined Chiefs of Staff as to the acceptance of the AFHQ Outline Plan nor can any decision be made at Allied Force Headquarters as to which plan to accept; that preparations should be made to accept either. Study is still being made at Allied Force Headquarters as to the withdrawal of troops from Italy for training in North Africa. Services of Supply North African Theater of Operations United States Army has already requisitioned some overall maintenance needs. However, phase requisitions and special equipment is a matter of further study.

A radiogram from Allied Force Headquarters dated 23 January instructed the planning staff to go ahead on the assumption that three American divisions would be in the assault. The following day this was changed to a one-division assault. To complicate matters further almost nothing could be done about training since no troop list had been agreed upon. The 85th Division, which had landed at Oran, was tentatively assigned to Force 163 for training. There were indications that the 85th Division would train in North Africa, and that the 3rd and 45th Divisions would be withdrawn from the Fifth Army as soon as they could be spared.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

By the end of January, General Patton had left for the United Kingdom and had taken with him several of his key staff officers. There had been no selection of French troops, no withdrawal of divisions from Italy for training, no staging areas assigned, nor any designation of a Base Section Commander. The possibility occurred to those concerned with planning that Operation *ANVIL* had been relegated to a "Command Post Exercise" status. Actually the various sections were groping for something definite on which to plan. This was true not only in Force 163 itself, but also in the Naval and Air Planning Groups.

General Sir Henry Maitland Wilson, Supreme Allied Commander, Mediterranean Theater, sent the following telegram on 8 February to the Joint Chiefs of Staff:

> It is essential to have very early decision regarding *ANVIL*. Preparations for full scale *ANVIL* at or near the original target date has immediate implications on conduct of the present battle for Italy. The whole future strategy in this theater is dependent on whether we are to mount *ANVIL* on a scale of at least a two division assault. I cannot plan the campaign in Italy until I know the decision regarding *ANVIL* and the resources which will be available to me, particularly as regards shipping, assault craft, air forces and troop carrier aircraft.

At the same time General Sir Harold Alexander, British Commander of the Allied Armies in Italy, sent a message to Allied Force Headquarters further amplifying General Wilson's views. It was his opinion that the enemy was preparing to make a stand south of Rome; and, even though there was a successful linkup between the Anzio Beachhead and the main front, all forces in Italy would be needed for an offensive to capture Rome. He strongly opposed the withdrawal of any troops from Italy any time in the near future and pointed out that at the earliest *ANVIL* could not be launched until late July. Furthermore, stated General Alexander, "I do not consider that *ANVIL* with the limited resources likely to be available, would have any effect on drawing enemy forces away from *OVERLORD*." General Alexander felt that until Lyon were threatened the enemy would probably not detach any forces from northern France, and this could not be achieved until Marseille and Toulon were captured.

It was now apparent that the 3rd and 45th Divisions, which were a part of the Anzio Beachhead forces, would not be available for

immediate transfer to Force 163. Two fronts in Italy had to be supplied continuously by water. All service and supply facilities were heavily taxed. What could be available for a third operation elsewhere? The historian of the *ANVIL* summary of events soberly recorded, "The failure of the *SHINGLE* operation to develop as it was expected is having a direct effect . . . . It is very difficult to make sound decisions under such uncertain conditions."

On 10 February the Combined Chiefs of Staff announced that D-Day for *OVERLORD* would be postponed about three weeks. The shipping requirements were proving to be enormous, and the Mediterranean Theater was to arrange for the immediate return to the United Kingdom of all LSTs not vitally needed.

Two days later, in a report of progress to Allied Force Headquarters, the *ANVIL* planning staff pointed out that in order to continue their work in an orderly fashion they would need a clear directive from higher headquarters, a definite troop list, and the nomination of ports for mounting. It was apparent to the staff that "The Italian battlefield has to be relegated to holding a defensive line while *ANVIL* is mounted or *ANVIL* can only be mounted in such strength as to be another *SHINGLE* . . . ."

AFHQ's reply was that all high-level decisions came from the Combined Chiefs of Staff and until such time as answers were forthcoming planning would have to continue "on the basis of assumptions". It was assumed that there would be a two-division assault, that the two assault divisions would be American and would be mounted in the Naples area; the two follow-up divisions would be mounted from Sicily and North Africa.

As the Italian Campaign developed, higher headquarters became "loathe to risk a change in commanders of the Fifth Army either now or in the near future". The decision was General Wilson's and was concurred in by General Devers. As of 28 February General Clark was relieved of all responsibility connected with *ANVIL*. His "grave burdens" made impossible the close supervision of the *ANVIL* operation which was now becoming necessary.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Pending the assignment of an army commander, General Garrison H. Davidson was requested to continue as the head of the planning group. As a matter of urgency he was asked to designate, at a meeting on 1 March before the assembled planning staff 48 hours hence, the area of southern France in which he believed the assault would be launched. This, of course, was to be in no way binding. The final decision would rest with the Army Commander himself.

General Davidson said that, assuming the target date of *ANVIL* would be on or after that of *OVERLORD*, on the basis of a two-division assault with an eight-division follow-up, and further assuming that sufficient shipping, air and naval support would be available, it was his opinion that the most favorable area for an assault in southern France was east of Toulon between Cape Cavalaire (Beach 259) and Agay (Beach 265). An assault in this area would provide the best opportunity for insuring a successful landing and adequate beaches over which to land supplies and follow-up forces, with nearby terrain suitable for the rapid construction of air strips.

General Patch Assumes Command

On 2 March Lieutenant General Alexander M. Patch (then Major General) was appointed commander of the ground forces taking part in Operation *ANVIL*. A newcomer to the European-African Theater of Operations, General Patch was well-known for his Guadalcanal campaign in the Pacific and more recently had commanded IV Corps on training duties in the Western United States.

The change of command was smoothly accomplished. Vacancies in Force 163 Staff which had been created when General Patton went to England were filled by staff officers from General Patch's previous command, IV Corps, just arriving in North Africa. Key officers from IV Corps included Major General Arthur A. White, Chief of Staff; Colonel W. H. Craig, A. C. of S., G-1; Colonel W. W. Quinn, A. C. of S., G-2, and Brigadier General John S. Guthrie, A. C. of S., G-3. A veteran Seventh Army Officer, Colonel O. C. Harvey, continued as A. C. of S., G-4. The post of Civil Affairs Officer (later G-5) went to Colonel Harvey S. Gerry, who joined Force 163 in April.

LT. GEN. GEORGE S. PATTON WITH LT. GEN. ALEXANDER M. PATCH
". . . The Seventh Army was to take the offensive again under a new commander . . ."

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

After Colonel Leo V. Warner joined the headquarters in July, 1944, as Deputy Chief of Staff, all General Staff positions remained unchanged throughout the Seventh Army's campaign into France and Germany except that of A. C. of S., G-5. Colonel Gerry was called to higher headquarters in October and was replaced by Colonel John J. Albright. Shortly thereafter Colonel Albright went to the 36th Infantry Division and on 4 December 1944, Colonel Joseph L. Canby became A. C. of S., G-5. Colonel Canby held the post during the remainder of the operation and well into the occupational period.

Two days after his appointment, General Patch was briefed on all planning which had been accomplished to date. He was able to inform his staff, as a result of conferences with high military sources while en-route to his new assignment, that in principle *ANVIL* had definitely been approved by the War Department and would enjoy a second priority in the world-wide operations of United States forces. He urged each officer to exert his best efforts for a successful completion of this major mission.

Basically, the Appreciation and Outline furnished Force 163 by AFHQ remained the governing plan. It was still envisaged, at the time General Patch assumed command, that *ANVIL* forces would invade southern France in conjunction with *OVERLORD*, establish a bridgehead, and subsequently exploit toward Lyon and Vichy. The target date was early June, although nominations of American and French components in the operation were yet undecided and would continue to depend on the progress of the battle in Italy. More imminent was the fact that an Outline Plan, coordinated with Naval and Air Task Force commanders, was to be submitted for AFHQ approval by 15 April.

Target Date Changes

Through the months to come, the original recommendations for the assault area as formulated under General Davidson were to remain intact. During March, conferences were held with the Air Corps and the Navy to discuss such matters as the employment of the Mediterranean Allied Air Forces, pre-D-Day bombing, the organization of the

Beach Control Board, and the work of the Beach Obstacle Board. A recommendation was made to AFHQ that provision be made for eighteen Naval Shore Fire Control parties, composed of Army and Navy personnel, to be included in Operation *ANVIL*.

In order to coordinate details, the Force 163 Headquarters from the very beginning included small Naval and Air planning staffs. Captain R. A. J. English, U. S. Navy, headed the Naval Group and Group Captain R. B. Lees, Royal Australian Air Force the planners from Mediterranean Allied Tactical Air Force. There were a number of British officers attached to the headquarters, both technical experts and observers. As the French came into the *ANVIL* picture, French officers reported for duty and were integrated in appropriate staff sections. The rambling white Ecole Normale in Bouzareah, high above Algiers, began to throb with its top secret activity. Many visitors drove past the rusty barbed wire and came through the tight Military Police guard.

In view of the fact that the target date for *ANVIL* was still tentatively scheduled for about 1 June, General Patch considered requesting firm decision from higher headquarters in order that Corps and Division detailed planning might begin immediately. It was essential that American assault divisions be designated immediately, that the Corps Commander and the Corps Staff be selected, and that French units be nominated. This request, however, was delayed for several days, since a major decision was expected momentarily.

On 12 April word arrived from General Wilson that the Supreme Allied Commander had decided that *ANVIL* could not now be launched before late July. The directive asking for coordinated plans to be submitted to Allied Force Headquarters by 15 April was now rescinded. Factors causing the postponement included the planning of an all out offensive in Italy, to begin about 10 May, and the withdrawal of landing craft from the Mediterranean for *OVERLORD*.

In accordance with AFHQ instructions the combined Ground, Naval, and Air Outline Plans for Operation *ANVIL* were presented on 29 April to the Supreme Allied Commander, Mediterranean Theater,

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

who arrived in Algiers accompanied by a group of senior officers including General Devers, Commanding General of NATOUSA, representatives of the Air Corps, the Navy, and the French. For some two hours in the War Room of Force 163 major outline plans were discussed. General Patch made some introductory statements; G-2 gave a brief but comprehensive estimate of the terrain, enemy capabilities, defense plans, and battle order.

The Army Outline Plan presented at this time was virtually the same as the one previously submitted for staff consideration a month before on 29 March. It called for a parachute force of at least three battalions to support the initial two-division assault. Commandos and Rangers were assigned certain special missions to neutralize the islands off the coast, block roads, and protect the assault flanks. The follow-up totaled eight divisions. The proposed target area was east of Toulon between Cape Cavalaire and the Bay of Agay. The Air Corps was to give close tactical support on D-Day and also to engage in an extensive program of pre-D-Day bombing from Spain to the Italian border. The Navy was charged with convoying, landing and supplying the assaulting forces, and cooperating with the Air Forces in reducing enemy beach defenses on D-Day.

On 5 May it was learned from the War Office in London through AFHQ that definite answers regarding questions on overall planning in the Mediterranean Theater could not be given immediately. During the same week AFHQ also announced that a new directive would shortly be issued relative to plans for a modified *ANVIL*. General Patch informed his staff that they might expect to plan several operations concurrently, any one of which might be put into action depending upon the situation.

Modifications

The target date of *ANVIL* had now been postponed until late July. Nevertheless General Patch left for the United Kingdom in order to coordinate his plans with those for *OVERLORD*. On 13 May AFHQ

issued a formal directive asking for the preparation of three separate plans which were to be coordinated with conditions known as *RANKIN A, B,* and *C*:

> *PLAN A* (Conditioned by partial German withdrawal): A two-division assault in the area east of Toulon with a target date early in August and having for its objective the capture of Toulon and Marseille and thence an exploitation northward toward Lyon and Vichy. The assumption was that the enemy would offer resistance on the beaches but would withdraw the greater part of his forces from the immediate coastal area and fight heavy delaying actions in the lower Rhone Valley.
>
> However, should the situation require it, a supplementary landing might have to be made over toward the Spanish border in the Sete area, followed by a rapid advance along the north shore of the Gulf of Lions. This plan was to be completed and ready for presentation not later than 10 June.
>
> *PLAN B* (Conditioned by complete evacuation of southern France): Assuming that the enemy was planning to evacuate all of southern France with the possible exception of a few of his satellite troops whose morale was too low for effective future employment, the object of the landing would be to harass the enemy and create confusion in his rear. If such a situation arose, the French Forces of the Interior would be called on to play a major part in carrying out sabotage and engaging in guerilla warfare to prevent German withdrawal. They were also to aid the military authority in restoring order, setting up local administration, and initiating urgent relief measures.
>
> The strength of the assault was to be the same as in *PLAN A*, but the landing was to be in the vicinity of Sete with an advance through the Carcassonne Gap on Bordeaux. The draft was to be completed and ready for presentation not later than 1 July.
>
> *PLAN C* (Conditioned by unconditional surrender and cessation of all organized resistance): If by chance the landing east of Marseille and Toulon should be unopposed, followed by a complete collapse of all enemy resistance in southern France due to a low state of morale and the breakdown of supply services, the Commanding General of the Seventh Army would be responsible for enforcing the armistice terms and restoring civil authority. It was expected that certain German troops would undoubtedly try to escape to the Rhine by any possible means, and the object of *PLAN C* was to disarm and administer enemy formations or individuals and prevent their movement or escape.

Now, in addition to the original outline plan for *ANVIL* there were three substitute plans to give maximum flexibility. On 24 May

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

Plan A was presented to interested Staff Sections. The Engineers, the Navy, and the Air Corps presented their respective aspects of the problem and discussed the most desirable time of action. G-3 proposed a scheme of maneuver for the initial assault to be modified after the capture of Toulon to provide for a change in mission. A land advance toward the Carcassonne Gap and another amphibious landing in the Sete area were among the possibilities considered.

A cable from the British Chiefs of Staff, dated 29 May, agreed that *ANVIL* should be given priority over all operations in the theater outside Italy and so recommended the operation to the Combined Chiefs of Staff. The Commanding General of NATOUSA now began again to requisition supplies on the greatest possible scale that shipping would permit, but warned the War Department that unless critical materials could be secured and shipped, the target date for late July or early August could not be met.

French Participation

One of the first indications that French military forces would participate in operation *ANVIL* was given in a G-3 memorandum 11 February 1944 from AFHQ in which "language difficulties" were discussed. Apparently an American-French staff along the lines of the American-British staff was completely impractical. A liaison section of specially selected staff officers was to be established to convey the orders of the American commander to the French formations taking part in the invasion. If political considerations made it necessary, there might be a French Deputy Commander with a small personal staff.

Clearly the French were to be brought into the *ANVIL* picture. Their role and contribution had to be calculated in the planning and in the preparations for the mounting of the operation. As a result of General Davidson's suggestion that the French High Command appoint a small headquarters or contact group capable of making decisions with respect to French subordinate units, a small planning group, headed by Colonel Jean L. Petit, was stationed at headquarters of Force 163. Colonel Petit worked closely with the American Chief of Staff, General White, and French officers were attached to staff sections.

From the very beginning the French were singleminded in their arguments in behalf of *ANVIL*. "It is inadmissable," General Charles De Gaulle contended, "for French troops at this stage of the war to be used elsewhere than in France." At times, as a matter of "prestige", the French sought, as representation for their forces, an Army under their own command. They even went so far as to suggest that all Allied forces taking part in the southern invasion might constitute a single army under French command.

To the French it was of vital importance that in a campaign for France's liberation their own forces should be under French command. They agreed, however, that though it meant placing a full French general under an American general of lower rank they would be willing for the Americans to handle all administration, supply, and the over-all

GEN. CHARLES DE GAULLE, GEN. DE LATTRE (left), AND FRENCH STAFF

... the fundamental contention as a matter of national pride and honor was for a French army under a French general on French soil ...

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

tactical planning. During the uncertain periods they were "seriously perturbed" to hear that alternatives to *ANVIL* were being considered. The fundamental contention as a matter of national pride and honor was for a French army under a French general on French soil.

On 15 March General De Gaulle visited General Wilson at his headquarters in Italy to declare his full cooperation in the coming battle of France. Three important elements were involved: the regular army, the resistance groups, and the administration of French territory as soon as it was freed from the enemy. General Wilson expressed satisfaction with these offers but pointed out that the Combined Chiefs of Staff had given priority to the battle of Italy. Rome would have to be taken before the battle of France could begin. The fact that it would be difficult to use French troops during the assault phase of the landing in southern France was also pointed out; but General Wilson indicated that after a beachhead had been secured, there was no reason why French troops could not be landed to participate in the ensuing battles. General De Gaulle stated that he realized this point of view to be correct and was in thorough accord.

One month later on 15 April General N. E. Bethouart, Chief of Staff of French National Defense, called on General Wilson in Algiers to say that General De Gaulle had named General de Lattre de Tassigny to command French forces in operation *ANVIL*. General Wilson stated that he was glad to hear that a choice had been made. He intimated, however, that it would be difficult to fit a French army commander in the scheme of things at this particular time because there were already too many staffs involved in planning. General Bethouart was informed that the matter would be discussed with the Commanding General of Force 163 and a decision rendered at a later date.

Shortly after this meeting, a question arose regarding French chain of command and channels of communication with Corsica. All French forces in the Mediterranean Theater, with the exception of Italy, had been placed under the command of General de Lattre; and General De Gaulle held that the normal channel of communication between AFHQ and French units in Corsica should be through the French Commander-in-Chief only. Applying, as it did, merely to the defense of

the Island of Corsica, and not to Allied operations which happened to be mounted from there, this contention was readily agreed to by AFHQ.

For the present the question was settled. It is, however, significant to note that the problem of the French chain of command continued to come up throughout the planning phase. This involved, in the opinion of the French, military and political prestige of the highest order, and therefore could not be dismissed lightly by those charged with planning *ANVIL*.

The French Army itself now proposed a plan for the invasion of southern France. During the first week of May General de Lattre called on General Patch at headquarters of Force 163 near Algiers and presented his proposal before an assembly of officers in the War Room. The French general emphasized the importance of carrying out *ANVIL* since it would be an opportunity for the French forces themselves to make a contribution to the liberation of their country. Only a few French troops, the staff was reminded, were to be used in *OVERLORD*. The plan outlined by General de Lattre differed in several respects from the original conception of *ANVIL*, and it was turned over to G-3 for further study and comment.

The French plan assumed that there would be available sufficient lift for an assault by three infantry divisions and two armored combat commands with a follow-up by D plus 3 of two infantry divisions. This of course, far exceeded the scale of present *ANVIL* plans of a two-division assault with a follow-up of one infantry division and one armored combat command. The French proposal for a landing both to the east and to the west of Toulon involved a division of forces which would, as General Patch pointed out in a letter to General de Lattre, reduce in proportion air cover, naval fire support, and the capacity of beach groups to unload supplies and consolidate their dumps. Also, to the west of Toulon was located the heaviest concentration of enemy coastal batteries and beach defenses which would undoubtedly increase the difficulties of the assault force. Finally, even though Toulon was attacked from only one side, probably making impossible an early capture of the city, the advantages of a less extended beachhead and more favorable terrain would out-weigh other considerations.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

A satisfactory arrangement was finally worked out to bring the French Army Headquarters into the *ANVIL* picture. It was proposed that during the initial phase of the operation General de Lattre would land as Commanding General of the first French Corps ashore, with the Corps commander as his deputy. The staff would consist of officers from the Army Headquarters as well as from the Corps Headquarters. When the second French Corps arrived, the Commanding General of Army B, using his Army Staff, would assume command of both corps, thus establishing his Army Headquarters. General De Gaulle, President of the French Committee of National Liberation and Chief of the Armed Forces, gave his approval.

Meanwhile, at Force 163 Headquarters in Bouzareah, American and French staff officers went steadily forward with their plans for equipping, training and supplying the French troops for *ANVIL*.

Troops and Supplies

The misfortune of Operation *ANVIL*, in its first planning period, was simply that its hopes and prospects fell in the long shadows cast by the bitter Italian campaign on the one side and the anxious preparations for *OVERLORD* in Normandy on the other. It was hardly unexpected that all first priorities for either troops or supplies went elsewhere. Logistics were consequently confined to hypothetical propositions which had to be constantly revised. There was the reluctance to withdraw any of General Alexander's divisions from Italy until after the breakthrough and capture of Rome. Nor could troops be diverted from any other theater.

Shortly after Force 163 set up its headquarters in Algiers, a rear echelon charged with supply planning was established in Oran. Services of Supply, NATOUSA, began pressing for requisitions for an operation which had not yet been approved by the Combined Chiefs of Staff in order that there would be no delay when authorization was received. As early as 21 January there was a request from Oran for loading plans, phased requisitions for vehicles, and mounting ports and staging areas. But inasmuch as no troop list had been established, and

none of these issues had yet been decided, only general replacement items could be ordered from the United States.

In the beginning the assumption was that two or three American divisions would be in the assault, and it was presumed that they would come from Italy. In view of current operations on the Italian peninsula it seemed doubtful that any large number of troops could be trained and mounted from the Naples area without tying up ports and transportation facilities. On 26 January word was received that units tentatively assigned to *ANVIL* would train as follows; the 85th Division in North Africa and the 3rd and 45th Divisions in Italy or Sicily. The latter two divisions would begin moving out to begin training about 3 February. Events later proved this was not possible.

At the end of the first week in February there was still no definite troop assignment, no mounting nor staging areas; and though the supply section of Force 163 was functioning, it had nothing definite on which to base its requisitions. At this date no French units had been assigned, but the Liaison Section did estimate the French were about 70,000 troops short of the requirements originally set for them.

The problem of U. S. replacements was similarly unclarified and unsolved. General Jacob L. Devers, Commanding General, NATOUSA and the Deputy Theater Commander, pointed out on 18 February that replacements allocated to the Mediterranean Theater under the present shipping schedule were hardly adequate to sustain operations in Italy. Furthermore, he maintained, any ground force replacements expected to arrive in the near future could not be diverted to any *ANVIL* units.

So it was that the combined Chiefs of Staff made their decision: *ANVIL* could not be launched before D-Day of *OVERLORD*. The forces involved, as now known, would be one American Corps of three divisions and two French Corps totaling five infantry divisions and two armored divisions. For purposes of planning, the total shipping which could be made available for the operation consisted of 100 ships for preloading, 105 ships during the first thirty days, 120 ships during the second thirty days, and 53 ships during the third thirty days. The

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

general rate of buildup was assumed to be on the basis of a two-division assault which might be modified.

A request that certain airborne and ranger type troops be made available to Force 163 for immediate training received the same response from AFHQ as had requests for combat divisions. It was stated that until the tactical situation in Italy had been clarified no commitments could be made. Specialized service troops, such as intelligence and translating personnel, were also difficult to obtain.

The essential *ANVIL* supply problem in the large issues of the invasion appeared to be that of smooth flow from the ships off-shore to the beach dumps, and behind that a smooth transition in the control of supplies from the Base Section to the Beach Groups. It was not considered possible to have a port available before D plus 25. In the first period, then, all supplies would come from beach dumps.

A Beach Control Planning Board was established on 21 March. All beach and engineer units were to be organized and trained directly under the control of Force 163, and not under the Base Section. Problems of organization, administration, and training were worked out with newly-designated Base Section representatives on the Control Group Planning Staff; a standard operating procedure for unloading supply ships, traffic control, maintenance of dumps, division of Army and sub-task force control, and the close coordination of all supply agencies.

Such training preparations as could be made in this early period remained as nebulous as the other aspects of *ANVIL* planning. The Amphibious Training Center, Brigadier General Henry C. Wolfe announced, was to be moved from Port Aux Poules, Algeria, to Italy. But no American troops had yet been designated for training. In fact, one regiment of the 85th Division had been relieved from Force 163 and assigned to Fifth Army. It was still impossible to state any definite date when the Ranger Force, Special Service Force, or the 509th Parachute Battalion would be available for training. When the rest of the 85th Division was ordered to proceed from North Africa to Italy to join the Fifth Army, any commitment of troops for *ANVIL* was now clearly and definitely postponed.

French units were designated on 7 April. Information was received from AFHQ that the 1st Motorized Infantry Division, 2nd Armored Division, and 9th Colonial Infantry Division had been committed to *ANVIL*, and were to be completely equipped in accordance with the policy of employing French units in combat operations as components of an American force. The 1st Armored Division and the 5th Armored Division were to be considered as "non-participating units".

By 15 April supplies requisitioned in January and early February began to arrive in the theater. Almost simultaneously SOS NATOUSA received word that the New York Port of Embarkation had cancelled all maintenance requisitions. Their instructions were that *ANVIL* was being discontinued. The Commanding General, NATOUSA now requested the War Department for a definite statement as to "whether cancellation of *ANVIL* including complete stoppage of supply action has occurred". According to the "present instructions" of SOS, "plans for *ANVIL* must continue"; and the cancellations were causing concern.

Even if an amphibious operation on the *ANVIL* scale were not to be launched until July or August, the logistics of the operation nevertheless demanded 100 cargo ships pre-loaded in mid-July and a 32,000 lift in personnel shipping. For subsequent follow-up convoys sufficient cargo shipping would have to be made available to allow 150 sailings in each of the first and second 30-day periods with 50 sailings in the third 30-day period. A personnel lift for 16,000 would also be needed in the follow-up convoys.

SOS NATOUSA had no alternative but to freeze the classes of supplies requisitioned originally for *ANVIL*. Now frozen were all Quartermaster, Engineer, Transportation, Ordnance, Medical, Signal, and Chemical Warfare items with the exception of high explosive and white phosphorous chemical mortar shells. Supplies now in the theater would be considered part of regular theater stocks and marked off against future requisitions. Shortly thereafter a message returned from the War Department to the effect that no cut in procurement was contemplated.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

It was clear some sort of major amphibious operation was being planned for the near future. Major General Thomas P. Larkin, the Commanding General of SOS NATOUSA asked for "clarification" from Operations and Plans Division, War Department in Washington and demanded that full and adequate supply planning information be given him in order to keep to a minimum last-minute requisitions of critical items. "As the situation now stands," General Patch pointed out on 31 May, supplies necessary for *ANVIL* "will not be available when required."

By June no nomination of American divisions had been definitely made. It was thought that probably the 45th, the 3rd, and the 36th or 85th Divisions would shortly be released from Italy in order to begin amphibious training. Plans were underway to move the 40th Engineer Regiment with its beach elements from North Africa to Italy in order to train with the 45th Division. The 540th Engineers were to train with the 3rd Division and the 36th Engineers with the remaining division. Likewise in the selection of service and technical maintenance troops it was desired to retain the units which had been working with combat divisions in the field in order to preserve as much as possible the element of team work.

On 11 May the all-out offensive of the Fifth and Eighth Armies got under way in Italy. The link-up of the Anzio Beachhead with the main front was followed by the capture of Rome. The release of troops from Italy for *ANVIL* had been dependent on a turn of events in the Italian campaign. On 4 June the Supreme Allied Commander in the Mediterranean agreed that three American divisions and one French Division could be released at an early date.

A firm decision, according to General Wilson, had been reached to mount an amphibious operation on the *ANVIL* scale. Headquarters of the Allied Armies in Italy was notified on 15 June to release the Headquarters of the U. S. VI Corps "at once", the 45th, 3rd, and 36th Divisions, two French Divisions and certain auxiliary combat troops, such as tank-destroyer battalions, tank battalions, and anti-aircraft units. These units were to be assigned to Force 163 for administration, planning, and training; and to SOS NATOUSA for supply.

Thus far no Base Section Commander had been nominated, although repeated requests had been made to NATOUSA for such an appointment. Finally on 26 June authority was received to activate the Coastal (later Continental) Base Section and Major General A. R. Wilson was nominated as commander. However, it was approximately a month later before General Sir Henry Maitland Wilson authorized Base Section Personnel to be put on detached service with Force 163. Throughout all supply planning, one of the fundamental conceptions was that key personnel of the Base Section should have an intimate knowledge of the Supply problem in order that they might assume full responsibility at the earliest possible date.

Decision for ANVIL

Even after assignment of troops to Force 163, it was by no means certain that *ANVIL* would go forward as planned. The possible courses of action included an amphibious operation at the head of the Adriatic as well as an assault against the south of France. In their message to General Sir Henry Maitland Wilson and Eisenhower, the Combined Chiefs of Staff had simply stated that "... preparations for an amphibious operation should go forward on the greatest scale for which resources can be made available and at the earliest date".

An alternative to *ANVIL* in the form of a drive toward the Balkans had been mentioned as early as March 1944 when the Supreme Allied Commander of the Mediterranean Theater proposed a cover plan in connection with *ANVIL*. General Wilson at this time explained the need for concealing preparations for a drive against Southern France in order to prevent the enemy from sending in reinforcements prior to the assault.

> By 21 May we shall know whether we are going to launch *ANVIL* or not. If we are, then *ANVIL* itself is the method by which we hope to contain German forces in southern France. The preparations for the real thing will no doubt be pretty obvious, but there should be no question of increasing the difficulties of a naturally difficult

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

operation by having it both ways, that is, trying to maintain enemy forces by the cover plan as well as the real thing.

The answer is therefore that whether or not it is ultimately decided to launch *ANVIL* our cover plan should aim at disguising our intentions to attack the south of France and to build up a threat to the Balkans. If *ANVIL* is decided on, these plans should hold to the last moment, at which time the *ANVIL* preparations should be explained away by a threat to northwest Italy. If on the other hand, it is decided not to launch *ANVIL* we shall at some date after 21 May have to mount some sort of threat or feint which will be obvious to the enemy. It is important to do nothing until the latest possible date that will attract enemy forces into France.

As the Italian situation opened up, there was quite a natural desire on the part of those in command there to keep sufficient troops to press the advantage. Shortly after the fall of Rome on 4 June, General Alexander, commanding Allied Forces in Italy, prepared a new review and appreciation of the tactical situation. General Alexander expressed himself as so convinced that a continued offensive in Italy would force the enemy to draw to a maximum on his reserves. His plans for the destruction of the German Army in Italy, practicable only "... if the forces and administrative resources now at my disposal remain intact...", would, he believed, render the greatest assistance to the Normandy Invasion. Once the Pisa-Rimini line was secured, he felt that the Allies should continue the pursuit northeast through the Ljubljana Gap toward southern Hungary.

General Sir Henry Maitland Wilson, in his turn, now felt that *ANVIL* could not be launched in time to be of use to *OVERLORD* and therefore could be eliminated. As an alternative to *ANVIL*, he recommended an advance to the Ljubljana Gap with an amphibious operation against Trieste at a later date.

Strongly disagreeing with this line of reasoning, General Eisenhower maintained that the advance on Ljubljana and Trieste suggested by General Wilson was no guarantee that an appreciable number of German divisions would be diverted from France. Such an operation, the Supreme Commander felt, would neither give an additional port which would be of direct assistance to *OVERLORD* nor would it render any positive effect until 1945.

"I therefore recommend *ANVIL*," General Eisenhower told the Combined Chiefs of Staff. "General Wilson is fully prepared to carry out *ANVIL* if the decision is made to do so. This opens up another gateway into France, which, if not the best geographical location, is the best we can hope to obtain at an early date. The possession of such a gateway I consider vital."

"In my view," General Eisenhower argued, "the resources of Great Britain and the United States will not permit us to maintain two major theaters in the European War, each with decisive missions."

General Eisenhower accordingly recommended that *ANVIL* be launched not later than 30 August and preferably by 15 August with sufficient strength to give it reasonable chances of success. In event of a negative decision, he asked that all French divisions, plus one or two

GENERAL DWIGHT D. EISENHOWER

Southern France would be invaded. Force 163 would at last have plans, supplies, a definite assault date . . .

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

American divisions previously allocated to *ANVIL*, be made available for *OVERLORD* as soon as shipping could be secured.

It was soon apparent that the combined Chiefs of Staff had taken the view that France would be the decisive Theater of operations during 1944. At a London conference attended by representatives from Supreme Headquarters Allied Expeditionary Force and Allied Force Headquarters, concluded about 23 June, *ANVIL* received the final go-ahead signal. Southern France would be invaded.

CHAPTER II

The Target Area and German Defense Plans

RELATIVELY free from the uncertainties which harassed some Force 163 planners during the early stages, the G-2 Section and its allied agencies progressed steadily in the task of gathering intelligence about the *ANVIL* target area. Detailed information of the Riviera Coast came in from varied sources — from air photographs, from agents, from Frenchmen who had known the area in happier days, and from Baedeker's Guide.

Algiers was then the heart of Free France, the true seat of the Comite de la Liberation, and it would be naive to state that efforts to conceal the activity at Bouzareah were entirely successful. An operation against Southern France was an obvious step, and one which would occur instinctively to every patriotic French exile. However G-2 took what security measures were possible. Persons intimate with planning were kept to the bare minimum, and the sponge-rubber relief maps in the War Room were zealously guarded. Force 163 personnel who met friends in downtown Algiers explained vaguely that they were "with AFHQ". No reference was made to Seventh Army.

Before going further — to allow fuller appreciation of the task confronting the planners for *ANVIL* — it is perhaps appropriate to describe in some detail the topography of the target area and at the same time to set down a brief resume of what G-2 was able to learn about enemy strength, capabilities and defenses in that area prior to D-day.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

Topography of the Target Area

The Mediterranean coast of France consists of three main mountain masses separated by two corridors. Along the Spanish border lie the Pyrenees, to the north of which is the Carcassonne Gap, formed by the valleys of the Garonne and Aude Rivers. Northeast of the Pyrenees is the Massif Central, which presents its steepest face to the Mediterranean. Farther east, toward the Italian-Swiss border, is the great mass of the Alps-Jura system. The latter two mountain masses are separated by the valley of the Rhone River, which is the great natural corridor from the Mediterranean coast to the Paris basin. The Rhone flows through a series of narrow valleys and broad basins, which are frequently openings into important corridors to the east. There is, for example, the valley of the Isere, leading to Grenoble, and the valley of the Durance, which separates the Provence Alps from the Dauphine Alps.

Below Avignon, the Rhone Valley widens into a broad delta which merges with the lowlands of the Carcassonne Gap to form a long stretch of marshy coast extending from the base of the Pyrenees to Marseille. The beaches in this area are suitable for large scale landings, but the delta is not a good entrance to the Rhone corridor because of the many water courses which intersect it. The general bogginess of the terrain is such as to create difficulties for both tracked and wheeled vehicles deploying off the roads. East of Marseille the coast is rugged and irregular where the mountain masses reach to the sea, leaving only narrow sand beaches and small deltaic plains. Passage into the interior is possible only through a few narrow river valleys, such as the Argens, which leads into the Durance corridor and is the best approach to the Rhone Valley from the south. It was a portion of this eastern coast, from the Baie de Cavalaire to the Rade d'Agay, which was chosen as the target area for Operation *ANVIL*.

In the target area there are three outstanding topographical features, the Massif des Maures, the Toulon-St. Raphael Corridor and the Provence Alps. The Massif is a hill mass about 35 miles long, about ten miles wide at its widest point, and rises to an average height of 1,000 to 1,500 feet. At the base of the Maures are the invasion beaches. The

corridor which lies behind the Massif is formed by the valleys of the Real Martin and Argens Rivers and varies in width from one to six miles. Farther inland are the Provence Alps, slightly higher than the coastal massif, but marked by the same steep slopes with broader valleys connected by low passes. On the east this range runs to the Alps proper, but on the west it drops off to the Durance River.

The Target area comprises a portion of the famed Riviera resort coast with a traditionally mild climate and sparse rainfall, particularly during summer. Most of the time light winds prevail, and gales or complete calms are rare. Cloud ceilings are usually unlimited, though haze over the coast occasionally limits visibility to five or six miles.

Soil in the target area varies from rocky to sandy; much bedrock at the surface makes digging a problem. Streams running from the mountain masses into the coastal area frequently dry up in summer, and even the larger rivers reach an extremely low-water state. However, during the summer occasional thunderstorms create the danger of flash floods. The original forest cover is almost entirely gone, and uncultivated areas are covered with patches of woodland, evergreen, oak, cork oak, pine, and chestnut or low scrub growth of juniper, broom, box, and myrtle, the latter frequently referred to as "maquis". Cultivated portions support olive, fig, almond, mulberry, citrus trees and vineyards, though the poor quality of the soil allows agriculture on a less extensive scale than in other parts of France.

The population is sparse in this region of Mediterranean France and is concentrated mostly in the immediate coastal strips. Because there are many Italians on the Riviera the proportion of native French is lower than in other regions of France. In the target area proper there are no large cities. The adjoining towns of St. Raphael and Frejus, having together a population of 19,000, are the largest settlements.

The road net in the target area is adequate for military operations. Two main highways cross the area; the coast road from Marseille to Nice, and the inland route from Frejus to Aix-en-Provence. There are also a number of secondary roads formerly suitable for military traffic, although many were allowed to deteriorate during the four years under

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

German control. Roads which run through narrow defiles are commanded by high ground on the flanks and can thus be easily blocked. Road surfaces are generally satisfactory, but the bridges are often old and narrow. In towns many important roads become narrow and winding, permitting only one-way traffic.

The railroads, like the highways, are also limited in the coastal area of southern France. A main line passes from Italy by way of Nice and Cannes and connects with the main north-south trunk line at Marseille; lesser lines cross the immediate beach area and connect the small coast towns with the main east-west line in the interior.

Though the Mediterranean coast of France has four major and four secondary ports, only three minor ports are in the immediate assault area. These minor ports, St. Tropez, Ste. Maxime and St. Raphael, offered a means of supplementing tonnage unloaded over beaches until Toulon, Marseille, and Nice could be made available to handle 10,000-ton Liberty Ships.

Enemy Strength and Capabilities

In planning for *ANVIL*, enemy capabilities, disposition, and defense strategy were a constant influence on final decisions. By the end of July 1944 the Mediterranean Sea was almost completely cleared of German naval power. Enemy naval strength was reduced to a destroyer, a few torpedo and escort boats, and approximately ten U-boats. There is no doubt that the Germans hoped to augment their U-boat fleet by construction and repair activities at Marseille and Toulon, but Allied air attacks not only crippled production facilities but also destroyed those U-boats which were in their pens awaiting repair. In the main, German naval craft were considered to have only a nuisance value and could offer no serious interference to the invasion of southern France.

Intelligence information indicated that by the middle of 1944 the German Luftwaffe had definitely reached a state of decline. Yet its disposition on air fields throughout southern France gave it speed of movement and a certain tactical surprise. Immediately prior to D-Day,

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

the most realiable estimates placed German air strength at approximately 200 airplanes either in or adjacent to the target area. It was assumed that in the event of invasion the Germans would be able to draw additional air strength from either Italy or northern Europe, if these squadrons were not already committed elsewhere.

Of the 200 planes assigned to southern France about three-fourths were especially designed for ship bombardment or reconnaissance. This functional distribution of the Luftwaffe suggests that German air strength was concerned mainly with efforts to embarrass Allied shipping in the Mediterranean and thereby impede any attempt at invasion or to discover by reconnaissance the scale and exact location of any landing in southern France.

By the middle of May 1944 increased German reconnaissance activity was observed over the Corsica-Sardinia sea lanes, while during the same period anti-shipping operations showed a marked decrease. This change in functional activity suggests that for the period immediately prior to D-Day the Luftwaffe had abandoned all hope of forestalling any invasion by attacking shipping and was now merely attempting to discover the time, the place, and the scale of the invasion.

The Allies estimated the possible air forces available to Germany in the *ANVIL* and adjacent areas to be 1,515 planes of all types. Of this total 1,085 were thought to be on French air fields in northeastern France. Southern France accounted for another 200-odd and Italy 190. The fact that there were great distances to be covered and that practically all available planes in northern Europe after 6 June were committed in Normandy or attempting to defend German factories and internal supply lines made it highly improbable that any additional planes could be spared for southern France. The most likely possibility seemed to be that 40 to 50 planes might be sent from northern Italy if the tactical situation permitted.

However, to checkmate enemy air activity during the critical period of the invasion, planning had to take into account three distinct possibilities: the sending of strong reinforcements into the assault area by withdrawing air power already committed elsewhere, the with-

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

drawing immediately of most of the aircraft stationed in southern France to prevent its destruction by a superior Allied airforce, or the sending for minor reinforcements from Italy and southwest Germany for restricted use over the immediate assault area.

The presence of any large-scale reinforcements would indicate a German willingness to risk heavy air losses in order to defend what they considered as vital territory. An immediate withdrawal of the greater part of their aircraft would suggest an opposite attitude on the part of the German High Command. Minor reinforcements sent into the area would merely convey the impression that the Luftwaffe was putting up a token defense with the idea of doing what damage possible and then of withdrawing to safety.

On the basis of Allied pre-D-Day intelligence the general opinion was that enemy air activity would soon dissipate itself. On D-Day and shortly thereafter there were expected the usual anti-shipping activities and sorties against Allied ground forces in an attempt to impede the establishment of a beachhead. However, it was thought that these activities would be so costly to the Germans that after three or four days the Luftwaffe would confine itself to isolated sneak raids and strafing of Allied forward positions. Finally, even this would degenerate into routine reconnaissance patrols for purposes of intelligence.

German Troop Dispositions

The utilization of the most advantageous terrain positions was the prime consideration in German ground force defense plans. In general terms, the delta of the Rhone River is considered the focal point for lines of communication running in all directions. The route northward up the Rhone Valley has always been the principal avenue of entry from the Mediterranean into the heart of France. At Lyon this route branches into roads northwest into the Loire Valley, north to the Paris Basin, and northeast into the approaches to Belfort Gap.

Prior to D-Day the Nineteenth German Army had at its disposal for the defense of southern France, nine divisions stationed along the Mediterranean coast and at strategic points in the interior. The

precise location at which the Allies would debark if they came was unknown to the Germans, so the entire coast required complete defensive coverage. Moreover, once an Allied landing point had become known, it would be necessary to move troops quickly to repel the invasion; and at the same time certain strategic locations must be occupied to protect flanks and internal supply lines.

To satisfy these basic requirements the Nineteenth Army distributed its nine available divisions and made such defensive preparations as were possible. The 716th Infantry Division was stationed in the extreme southwest at Perpignan, for this town intercepted the coastal route from Spain to France and served as the chief strategic point for the protection of the west flank. To the north at Narbonne was the 198th Infantry Division, and in and about Montpellier the 189th Reserve Division, both of which were in position to dominate the inland route from the Mediterranean to the Garonne Valley by way of the Toulouse-Carcassonne depression. The 338th Infantry Division was centered about Arles and served to defend both the Mediterranean coast and the mouth of the Rhone River. The 244th and the 242nd Infantry Divisions were garrisoned at Marseille and at Toulon, and both were in position for the defense of their respective seaports.

On the extreme eastern segment of the French coast, in the Cannes-Nice area, was the 148th Reserve Division. It was entrusted not only with defending beaches in the sector but also with securing the area against any movement along the coast or from a landing in the Genoa area. The two remaining divisions were situated at nodal points north of the coastline. One of these, the 11th Panzer, had been located near Bordeaux; but by D-Day was in movement toward the Rhone. The other, the 157th Reserve Division, was a training division some of whose elements had been committed against the Maquis.

These nine German divisions formed the defensive pattern for the Nineteenth Army in southern France. Their composition, strength, and fire-power varied to such a degree that a brief analysis of each division is necessary to clarify the character of their subsequent performances. The 716th Infantry Division at Perpignan had undergone heavy losses in Normandy and had been sent south to refit. It was now

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

reduced to about 8,000 men with an effective fire power of about 50 percent. The 198th Infantry Division had recently been shifted to France from the Russian front and upon reorganization had acquired a large percentage of Bohemians and Czechs. It had an estimated strength of 10,500 men but with a somewhat reduced fire-power. Though the 189th Reserve Division was reputed to have a strength of four infantry battalions and one artillery battalion, it was never able to get together more than a battle group consisting of portions of two regiments for the battle of southern France.

The 338th Infantry Division, composed largely of limited service personnel, had sent an equivalent of four battalions as reinforcements to the Brittany-Normandy front. Only two understrength regiments were available to throw against the Seventh Army. The 242nd and 244th Infantry Divisions defending Toulon and Marseille were at 85 percent of normal strength in personnel, which included many young men without much combat experience. The 148th and the 157th Reserve Infantry Divisions on the eastern flank were believed to be relatively powerful, at full divisional strength; but their battle experience was not known. The only genuinely mobile unit was the 11th Panzer Division, which had seen action in Russia. It was considered to be up to strength with eight infantry battalions but was short one of its tank battalions.

This defensive set-up in southern France was the result of a redistribution of forces by the German High Command after Allied landings in Normandy. Between the June invasion and August the 9th Panzer and the 271st, 272nd, and the 277th Infantry Divisions had been withdrawn from the Nineteenth Army and ordered north. To compensate for these losses the 11th Panzer, the 198th and the 716th Infantry Divisions were transferred to southern France. In addition to the 11th Panzer Division, still of considerable strength, there were only five reasonably effective infantry divisions available to the Nineteenth Army. Furthermore, the actual combat effectiveness of this defending force was weakened by the inclusion of many non-Germanic elements, who were presumed to be serving under duress. Finally, the grave shortage of motor vehicles and fuel, plus the constant threat of attack

by the French Forces of the Interior, had a profound effect on enemy morale. For example, the 157th Reserve Division, while substantially intact, had been dissipated in the mountain strongholds of the Maquis.

This lack of strength and fire-power could be remedied only by the introduction of troops and equipment from outside the immediate area of southern France. However, German committments on other fronts and lack of sufficient reserves in Germany proper made it quite unlikely that reinforcements in sufficient strength could be counted on.

It was thought that a possible German reaction to Allied landings would be a withdrawal from the immediate coastal area to the Rhone Valley with a serious attempt to defend Marseille and Toulon. Because the terrain of the beach area is such as to preclude the effective use of mobile troops, the logical plan of withdrawal would be to fall back to the Rhone Valley and take up defensive positions. The prediction of a stubborn defense at Marseille and Toulon was based on the assumption that denial to the Allies of the use of large ports would delay a rapid build-up. This delay might allow the Germans to gain sufficient time to assemble their forces for a major defensive stand in the lower Rhone Valley or to withdraw them northward to safety.

Any Allied landing between Marseille and Nice would probably encounter elements of the 148th Infantry Division along the eastern segment of the Mediterranean coast and units of the 242nd Infantry Division in and about Toulon. As soon as the focus and magnitude of the invasion became clear to the German High Command, it was assumed that defense divisions would be maneuvered to meet the initial thrust and to modify the pattern of divisional distribution to prevent isolation or encirclement of those elements not yet actively committed to combat.

The German Defense System

Between November 1942 and September 1943 southern France had been divided into German and Italian zones of defense. The line of demarcation between these zones ran east of Toulon and left the Germans responsible for defending the two principal French ports on the

Mediterranean. After the collapse of Italy in September 1943 the Germans were faced with the problem of defending the entire French Mediterranean coast. Defenses were quickly installed to make the chain of fortifications from Spain to Italy complete.

It was known that, in the event of an Allied landing, the German High Command would immediately take the following steps: 1. Order all troops to their assembly areas. 2. Proclaim a state of siege. 3. Forbid the civilian population to circulate except certain special classes of workers and officials. 4. Requisition all able-bodied men and serviceable vehicles. 5. Guard all railroads and other communication facilities. 6. Demolish all machine shops, garages, and other installations which might be of service to the Allies. 7. Require the French to abide closely by the terms of the Armistice of 1940. In addition, trustworthy

Teut workers and collaborating French were to be formed into defensive detachments, and it was even reported that certain native North African prisoners of war were to be turned loose to create disorder.

A general policy of laying mines in strips along the coast was carried out by the Germans. As early as April 1944 it was reported that the construction of underwater obstacles had commenced. Offshore defense measures were used chiefly in and around the big ports, and included anti-torpedo and anti-submarine booms and nets, fire barges, and warning devices, such as hydrophones and infra-red barrages.

The enemy made the maximum use of artillery for coastal defense purposes. Batteries included railroad guns, heavy coast artillery, German field pieces, old French and Italian equipment, and even

sibility to the division charged with defending that sector. Multi-purpose guns near the beaches were placed in positions so as to be fired at sea targets as well as to cover dead spaces between the more important coastal batteries. There was a system of anti-aircraft searchlights throughout the target area, and the whole coastal strip was covered by radar stations.

A GERMAN PLOTTER AND RANGEFINDER INSTALLATION LOOKING OUT TO SEA

. . . The whole coastal strip was covered by radar stations . . .

In general, local defenses along the Mediterranean coast were not deep. They were constructed around a system of strongpoints which involved concrete pillboxes and subsidiary features, such as barbed wire and mine fields. The whole system of defensive works embraced blockhouses, pillboxes, personnel shelter, and command posts, often very skillfully camouflaged as local buildings. There was also considerable improvisation; tank turrets were mounted on concrete as pillboxes or tanks were almost completely buried with only the top of the

turret and the gun exposed above ground. The system of beach defenses generally extended inland only so far as was necessary to take advantage of the terrain.

Roadblocks and antitank obstacles were prepared extensively where tank or vehicular traffic might be expected. Tank obstacles

. . . Roadblocks and anti-tank obstacles were prepared extensively where tank or vehicular traffic might be expected . . .

included walls and ditches, concrete cubes, cones, pyramids, dragon's teeth, steel rail, timbers, and antitank blockhouses. Roadblocks in the beach area were usually defended by machine guns and light artillery. In many places previously prepared obstacles were in readiness along the side of the roads to be put into use if the situation required.

From experience gained in Italy and later in Normandy it was expected that the Germans would make extensive use of mines and

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

demolitions. Mines were planted in anti-personnel and antitank minefields blocking all obvious avenues of approach and in road-beds which ran from the beaches to the main lateral highways. Demolition charges were prepared for highway and railroad bridges, viaducts, dams, tunnels, and in banks along sides of roads where landslides could be started.

The Invasion Beaches

The main assault area extended approximately 45 miles along the coast from the Bay of Cavalaire to the Rade of Agay. It included 16 individual beaches numbered serially from west to east and divided into the principal divisional assault area known as Alpha, Delta, and Camel. The individual beaches varied from 500 yards to 4,500 yards in length and from ten to 50 yards in width, each landing area presenting an individual topographical problem.

On the extreme western flank along the Bay of Cavalaire and the Bay of Pampelonne are the "Alpha" beaches, 259, 260, 260-A, 261 and 261-A. Beaches 259 and 260 are backed by a narrow belt of tree-covered dunes, behind which run a highway and a narrow-gauge railroad. To the southwest are wooded slopes and the village of Cavalaire and to the east cultivated fields. Several small streams traverse the area but are such as to present no obstacle to the advance of infantry. However, because of soft sand it was assumed that preparation would be necessary to insure that wheeled vehicles could negotiate the first 50 yards from the water's edge and gain the hard ground and highway beyond.

The defenses in the Alpha area were considered moderate. There were three or four casemates, a dozen or so pillboxes, and 17 machine guns. On the high ground beyond were located eight light antiaircraft guns and at the extreme western end four batteries of fixed guns of medium caliber. Parallel to the shore line of Beach 259, about 60 yards out, were concrete pyramids covered by fire from artillery and machine guns. Barbed wire extended some 800 yards in the center of the beach and the whole area was thought to be thoroughly mined. Intelligence reports prior to D-Day indicated that there were probably two companies of 100 men each manning the defenses.

Beach 261 stretches along the Bay of Pampelonne for a distance of 4,500 yards between the rocky points of Cape Pinet and Bonne Terasse. The terrain consists of soft sand with a wooded slope in the center and flat plain on either end. The gradient is sufficient for small landing craft, such as LCIs or LCVPs, to nose up to shore; but larger craft would require pontoons for a dry landing. Enemy defenses were considered moderate and consisted of a single row of piles about 150 feet off shore, pillboxes, wire, and mine fields. There were roadblocks placed across all exits and two coastal batteries some distance to the rear. It was estimated that there was an understrength enemy battalion of 400 men defending the area.

Beaches in the "Delta" assault area, 262, 262-A, 263, 263-A, 263-B, and 263-C are in the vicinity of St. Tropez and Ste. Maxime. Those on the northern shore of the Gulf of St. Tropez are partially protected from the surf. Off shore was a single line of floats designed to support an anti-submarine net and block the channel into the harbor of St. Tropez. The north end of Beach 262 was particularly strongly defended, and there were pillboxes and casemates at the southern end as well. Between these two strongpoints the Germans had placed a double apron of barbed wire to be covered by fire and supplemented by mine fields. Behind the beach itself the terrain is flat and swampy and interspersed by small streams. This area was covered by a series of small mine fields staggered in such a way as to block all obvious exits. The main arterial highway which runs from Marseille to Nice along the northern shore of the Gulf was also heavily mined.

A few miles to the east, at the seaward end of the Gulf of St. Tropez, are two beaches near the town of Ste. Maxime. From the point of view of topography, they are similar to those at the other end of the gulf. In defenses they were perhaps less strong. One of the beaches is flanked by a seawall, and on the other the Germans had constructed an antitank wall 900 feet long and six feet thick. Its height was insufficient to hamper infantry in a scramble landing, but it had to be breached before tanks and vehicles could reach the coastal highway. A line of floats blocked the entrance into the harbor of Ste. Maxime.

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

East of Ste. Maxime along the inner curve of Bougnon Bay are three small sand and shingle beaches backed by the coastal belt of dunes, which run up to the coastal road and narrow gauge railroad. Beyond this are steep wooded slopes which merge into cultivated areas when the terrain becomes more level. At Garonnette Beach 263-C is cut in two by the Garonnette River. Because of an almost vertical embankment 40 to 50 feet high, only by way of the extreme eastern end does the terrain offer an exit to the coastal road. These three beaches were considered to be lightly defended but were well mined, flanked in part by an antitank wall, and protected by wire. Pillboxes were located at strategic points, and several batteries of coastal guns covered the approaches from the sea.

The third and final group of beaches, 264, 264-A, 264-B, 265, and 265-A, made up the "Camel" assault area and extended from Point St. Aygulf to Antheor. Beaches 264 and 264-A in the Frejus-St. Raphael area were heavily defended by underwater mine fields and off-shore concrete obstacles. On all roads leading from the beach area, on imporfant streets in the two towns, and even on the coastal highway itself, there were carefully-planted mine fields, antitank ditches, and road blocks consisting of dragon's teeth and concrete pillars.

Beach 265 at the head of the Rade of Agay was considered strongly defended. It is semi-circular in shape and bounded on the west by a small boat harbor and on the east by a low, rocky point. Directly behind is the coast road and railroad, and the connecting terrain is flat and cultivated. This meant that all types of landing craft could come up to the beach, but soft sand would make preparation of a road necessary for tracked and wheeled vehicles.

There were six batteries of light coast defense guns augmented by well camouflaged pillboxes, wire, and mines so located as to take advantage of excellent defensive terrain features. The Rade of Agay a series of floats was anchored off shore to support an anti-submarine net and was reported mined to a vertical depth of from 20 to 50 fathoms. A 150-yard antitank wall in the center of the beach was protected from the sea approach by a mine field 300 yards long. Behind the wall was another mine field, and still farther back on the high ground adjacent to the highway and railroad was a third. Three highway bridges opposite the beach area had been destroyed previous to D-Day, and the railroad bridge over the Agay River prepared for demolition. A few hundred yards to the rear of the highway the Germans had installed two radar stations.

West of the Rade of Agay and facing south, Beach 264 extends from Cap Drammont, a steep red cliff, to the west. Quarried rock rises behind the sand and shingle beach. The main coastal road and railroad run close to the shore, the best exit to the road is at the extreme eastern end of the beach. At Antheor on the other side of the Rade and facing southeast is 265-A, a small beach of fine sand 100 yards long and 30 yards wide at the head of a cove with steep and rocky sides. The beach is backed by the road and a sharply rising coastline, behind which is a high viaduct carrying the main railway line. Hence it was assumed that Infantry could land without difficulty and move on to the coast road, but that for vehicles extensive preparation would be necessary. These two minor beaches, because they were considered lightly defended, were chosen for Camel assault at H-Hour.

About seven miles off the coast of the target area are the islands of Levant and Port Cros. Their strategic location made them a menace to convoys approaching the beaches, and their neutralization was considered essential. For the most part, these islands are beachless with steep cliffs dropping down to the water's edge. The interior consists of scrub-covered hills broken here and there by small patches of cultivated land. On the western end of Port Cros the enemy was reported to have a coastal battery protected by antiaircraft and machine guns. The island of Levant, which lies northeast of Port Cros, was an even greater threat because of its closer proximity to the invasion beaches and convoy route. The most significant fortifications were constructed on the northeastern tip of the island and consisted of three or four 164 mm guns, machine guns, pillboxes, and a searchlight. Four medium coast defense guns were thought to be in position on the other end of the island.

The constantly changing disposition of enemy troops made it necessary for those planning *ANVIL* to reconsider from day to day the

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

tactics and the logistics of the contemplated operation. After the launching of *OVERLORD* the German High Command was forced to shift to the Normandy front certain divisions previously designated for the defense of southern France. Because replacements in personnel and equipment were difficult to obtain, the defense of the Mediterranean coast, as D-Day approached, was undoubtedly not on the scale that the Germans had originally planned.

If the assaulting forces were successful in breaking through the German coast defense system and establishing a permanent beachhead, the enemy's most logical course would be to take advantage of the defensive terrain, fight delaying actions, and attempt to withdraw his main force to safety. The possibility of a complete German collapse with the immediate cessation of hostilities or, on the other hand, a series of vigorous counterattacks supported by armor and mobile troops were the two extremes which had to be considered by those planning the invasion.

TENTATIVE OUTLINE PLAN ANVIL
THREE-DIVISION ASSAULT

CHAPTER III

Final Planning

GENERAL Eisenhower's message of 23 June and the Combined Chiefs of Staff's decision were the turning points for *ANVIL*. The operation had been forced to compete for troops and supplies on the one hand with *OVERLORD*, the most important operation of 1944, and on the other with the Italian campaign, which until the capture of Rome absorbed the greater part of the military resources of the theater. There is no

GEN. SIR HENRY MAITLAND WILSON WITH GEN. PATCH

". . . for a long time the hopes and prospects for ANVIL had fallen in the shadows cast by the bitter Italian campaign . . ."

THIS PAGE IS UNCLASSIFIED

doubt, however, that valuable preliminary work was accomplished during the first half of 1944. For when higher authority definitely decided that the operation against southern France would be mounted in mid-August, final planning was accomplished with remarkably little confusion and delay.

VI Corps Enters Picture

The tentative Army *ANVIL* plan was flown to VI Corps headquarters at Naples on 26 June. In a cover letter to the Commanding General, General Patch explained: "It has not as yet had the approval of the Supreme Allied Commander, and therefore is subject to change. However, it will at least give you and your staff a basis for planning . . . Please submit any changes you may wish to suggest as early as convenient and feel utterly free to comment."

LT. GEN. LUCIAN K. TRUSCOTT
". . . no Salerno . . ."

The next day a reply was returned. There were apparently many points of disagreement, and some of the *ANVIL* information General Truscott found "most disturbing". In his letter to General Patch, dated 27 June 1944, he wrote, "It has been my understanding up to this time that I am to command the actual assault . . . I think it would be highly desirable for me to be present when this plan is presented to the Supreme Allied Commander," In the first place, the proposed chain of command seemed to be creating "a grave risk". Until a beachhead was established, General Truscott felt that assault troops should be under the Assault Force Commander, and only afterwards revert to Army control. "I have no doubt that much of the difficulty that attended the Salerno landing was due to the confused command organization during the assault phase. I sincerely hope that we will not repeat that mistake . . . ."

Finally, the general warned against an over extension of the beachhead line in an effort to take in too much of the coast. Fearing a

VICE ADMIRAL ARTHUR K. HEWITT AND LT. GEN. JACOB L. DEVERS
". . . once the decision was made, final planning was accomplished with remarkably little confusion and delay . . ."

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

repetition of "the Anzio error", he suggested that for a three-division front the original limits of the Blue Line should be the maximum undertaken. Any over extension would make impossible the massing of sufficient strength for the advance to the west. There were some other points of disagreement.

General Devers, then in Italy, was also concerned that steps be taken to insure that command be clearly defined during the assault phase. He sent a cable to Major General L. W. Rooks, Deputy Chief of Staff, AFHQ, to arrange a conference with General Patch on the subject and further stating "... I have an idea that an Army Group will event-

GEN. GEORGE C. MARSHALL AND MAJ. GEN. JOHN O'DANIEL (3RD DIV)
the invasion of France had first priority in America's world-wide operations

ually come into this after the landing of two armies and additional troops are poured in from other sources". On 28 June General Patch, after a staff meeting, invited VI Corps planning officers to accompany their Commanding General to Force Headquarters at Algiers for a more detailed study of the problem. It was felt desirable that these matters

of disagreement be examined and clarified before the plan was submitted to the Supreme Allied Commander, Mediterranean Theater, for his final approval.

Since there had never been any other intention than that the assault Corps commander would have untrammeled control of his troops, the apparent difficulties easily reconciled themselves upon discussion. The Seventh Army staff had, during the months which preceded final decision, of necessity gone into great detail and settled matters which — had the Corps been designated earlier — would obviously have been left to the Corps commander. But this detailed planning was necessary if the work was to go forward, and the question of command unity — one on which many bitter lessons had been learned — was not, and never became, a real issue.

The *ANVIL* Outline Plan with latest revisions was presented to General Wilson on 28 June. Lieutenant General A. H. Gammell, AFHQ Chief of Staff, sent word on 2 July that SACMED approved and suggested only that further study be given to the most effective use of the Airborne Division to determine whether it should be used in one concentrated area rather than at three scattered points as was proposed in the outline plan.

The Naples Interlude

Seventh Army Headquarters moved early in July from Algiers, North Africa, to Naples, Italy, opening at the new location on 4 July. Thenceforth the term "Force 163" was not used. In the Flambeau Building on the Naples waterfront, the headquarters enjoyed proximity to French Armee "B" and VI Corps headquarters, also in Naples, and was a half hour's motor trip from Caserta Palace, new site for Headquarters AFHQ. The Seventh Army Headquarters rear echelon, which had moved during May from Palermo, Sicily, to Mostaganeu, French North Africa, also moved to Naples.

The Naples move allowed closer supervision of training. VI Corps headquarters had already planned that the 45th Division would arrive at the Amphibious Training Center in the Naples-Salerno area

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

on 24 June, the 3rd Division on 28 June and the 36th or 85th Division on 6 July. Each division was to receive about three weeks of amphibious training. The program was to culminate in a simulated landing exercise, with conditions on the coast of southern France approximated as closely as possible.

As the congestion of American, French and British troops increased along Via Roma, and as the harbor became daily more crowded with shipping, Seventh Army's staff worked late. Leading military and naval figures of the Mediterranean Theater conferred at the headquarters almost daily. Observers began to arrive. The dusty, impressive Flambeau Building -- once the home of an Italian shipping concern — shook with the clatter of typewriters. There were a few minor air raids. Anyone who looked at the harbor could see that something was in the wind.

By 8 July Seventh Army Headquarters was in possession of a directive issued by Allied Force Headquarters to Commanders of the Mediterranean Naval and Air Force and to the *DRAGOON* Ground Task Force Commander. The directive was as follows:

> 1. In accordance with the directive of the Combined Chiefs of Staff, the Supreme Allied Commander directs that preparations be made to mount and launch, with a target date of Q 14, the amphibious *ANVIL* Operation which was presented in outline plan and approved by him on 28 June. The twofold mission of this operation will be:
>
> a. To establish a beachhead east of Toulon as a base for the assault and capture of Toulon;
>
> b. Thereafter to capture Marseille and exploit toward Lyon and Vichy.
>
> 2. Conduct of the operation will conform to the principles of joint command. The Commander-in-Chief Mediterranean Theater will provide the Naval forces and will appoint a Naval Task Force Commander. The Naval Task Force Commander will assume command of the entire seaborne expedition from the time of sailing until the Ground Force is firmly established ashore, after which command of ground operations passes to the Ground Forces commander ashore. The Ground Task Force Commander, Headquarters Force 163, is hereby appointed Commander of all Ground Forces taking part in the operation. The Air Commander-in-Chief will nominate an Air Task Force Commander and will provide full air support for the operation.

> 3. Responsibility for the operations given in paragraph 1 above, will remain with SAC Mediterranean until such time as SCAEF can assume operational control. It is contemplated that this may be effected when SCAEF can also assume the supply responsibilities coincident with control. Until such time as this shift of responsibility is made, directives to Commanders concerned will emanate from this Headquarters.
>
> 4. Preparations for the operation will be made on the basis of approximately a three Division assault with an airborne lift of a strength to be decided later. Plans should be made for an ultimate build-up of at least ten divisions as rapidly as available resources will permit.
>
> 5. The Commanding General, SOS NATOUSA, will be responsible to AFHQ for mounting the operation.
>
> 6. For your information, all concerned are being advised that all available Mediterranean resources not required for Operation *ANVIL* will be used to continue offensive operations in Italy.
>
> 7. The French High Command has been advised of the target date for the launching of this operation.

The Navy, in the interest of more effective cooperation, suggested that the Sub-Task Force Commanders be assigned to and placed in contact with the divisions they were actually to work with during the operation. The Navy had no planning staff at the Corps level, and this was all the more reason for working intimately with the divisions. Throughout, Vice Admiral Hewitt, the senior naval officer, was kept in close contact with the progress in training by Headquarters Seventh Army. His representative, Captain English, had offices in the Flambeau Building and worked practically as a member of the Army staff.

Coordinating with French

The employment of French forces and French channels of command came up for final settlement during the course of several planning conferences in July. It was decided that during the early phase of the operation Headquarters Seventh Army would exercise command functions over the U. S. VI Corps and such French contingents as were ashore. Channels of command would thus be direct from Seventh Army to the French Army Commander. However, when a total of two French

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Corps had been landed, the French Army Headquarters would assume tactical command of the two corps; and Headquarters Seventh Army would assume the normal tactical and strategical functions of a Headquarters, Army Group, retaining at the same time logistical and administrative functions for the entire *ANVIL* force.

The plan to attach the 1st French Armored Combat Command to the U. S. VI Corps during the assault phase also came up for discussion and clarification. General De Gaulle had only "reluctantly consented to this employment under American command." General de Lattre expected the return of this Combat Command not later than D plus three; its full use was being counted on in the operation against Toulon. However, it was obvious that the VI Corps would need armor not only for the assault but also for its subsequent advance to the northwest, and if there were any questions of command authority or limitations on its employment this arrangement would not be satisfactory. General Truscott suggested that this matter be taken up with the Supreme Allied Commander, Mediterranean Theater, without delay.

Combat elements of II French Corps were scheduled to arrive in the Naples area about 8 July. They were to refit and then go promptly to Taranto for loading. Since the French had only a skeleton staff of their II Corps in Italy, it was advised that the remainder be summoned from North Africa in order to supervise properly troop movement and combat loading. The French were short on replacement personnel, but it was understood that they expected to recruit locally after entry into the target area. This was a matter of serious importance for future planning inasmuch as the use of American equipment was involved.

The French High Command was requested early in July to give General Patch immediate operational control of all the Army "B" units. Certain key French Staff Officers were still a part of General Juin's command in Italy. It was urged that they be released as soon as possible so as to be available to work with General de Lattre on final French plans for the operation. Withdrawal of the whole French Expeditionary Corps from Italy was to be completed by 24 July and only a minimum of time was to be allowed for refitting.

The question of Seventh Army control over French troops was agreed to in a letter to the Chief of Staff, AFHQ, from General Bethouart, French Chief of Staff of National Defense. This letter was in part as follows:

> I have the honor to inform you that I agree that Army "B" which includes all French formations and units nominated for Operation *ANVIL* and which are under the command of General of Army de Lattre de Tassigny, be placed with effect from today, 7 July 1944, under the orders of the Commanding General, Force 163.

General Patch shortly thereafter issued a directive to General de Lattre providing that ". . . Under the direction of this headquarters, you will be responsible for the necessary outline plan, order and instructions, to include the training, equipping and mounting of your forces, passage of your force through the left of the U. S. Corps, and the capture of Toulon".

MAJ. GEN. R. T. FREDERICK
". . . planning, organizing, training . . ."

Much consideration was given to special troops to be included in the invasion forces. The Invasion Training Center was notified that the 1st Special Service Force would engage in a training program to end with a two-day final excercise between 5 and 20 July. Major General R. T. Frederick, appointed to command the Provisional Airborne Division, began temporary planning, organizing, and training near Rome pending the arrival of an Airborne Division Staff from the United States. The 2nd British Independent Parachute Brigade, which was to be incorporated into the Provisional Airborne Division, now came under the operational command of Seventh Army. On 8 July NATOUSA directed that the Seventh Army Airborne Division (Provisional) be organized and trained.

In a message to General Eisenhower on 4 July, General Wilson had shown some concern over the amount of the airborne lift to be made

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

available. Since the decision had been made to increase the assault to three divisions, the boundaries of the target area would likewise be increased, and more extensive airborne operations were designed to block the movement of enemy reserves into the assault area. General Wilson asked for "not less than 384 operational aircraft in addition to those at present in the Mediterranean . . . ."

The limited availability of troops and air lift was one reason for the abandonment of two suggested airborne operations in connection with *ANVIL*. One was a proposal from Washington that a force consisting of one airborne division and three air landed infantry divisions attack about D plus ten in the vicinity of Avignon. Another was Plan *CAIMAN*, an operation urged by General de Gaulle as a means of supporting Maquis in the Massif Centrale. General Wilson stated that it would be impossible to carry out *CAIMAN*, or even a smaller operation, until *ANVIL* had been firmly lodged.

On 20 July Troop Carrier Groups allocated to *ANVIL* began to arrive at Italian bases from the United Kingdom. The Airborne Plan was studied in order to review the feasibility of securing and assembling gliders, completing training, and mounting the operation in the remaining time available. Brigadier General P. L. Williams assumed command of the Provisional Troop Carrier Air Division.

A most vital mission, that of landing prior to H-Hour in the Cape Negre area and isolating the target area on the west, had early in the planning stage been entrusted to the French Groupe de Commandos under Lieutenant Colonel Georges Bouvet. Another special force requiring consideration was the French Naval Assault Group, a demolition party which was to land on the right flank in the vicinity of Pointe des Trayas.

Questions of Tactics

A Commanders' Conference held on 12 July took up the following topics with relation to Operation *ANVIL*: air action prior to and on D-Day, assault loading, further development in the use of airborne troops, and the relation of the battle in Italy to the invasion of

southern France. Two days later Admiral Hewitt informed General Truscott of a new naval dissent to the *ANVIL* proposals. "I believe," he wrote, "that the proposal to land the second assault from LCI(L)s is unsound. It is going to run into trouble when any sort of resistance exists, as experience at Elba only too well showed. When an LCI(L) gets hit you lose about 200 soldiers. If an LCVP gets hit you lose only about 30. At Elba the initial wave in the smaller craft got in. The LCI(L)s attempting to follow could not get in . . . ." The unfortunate big-boat follow-up waves in the operation against the Mediterranean island on 17 June 1944 had been vulnerable targets for artillery fire.

Throughout the remainder of July tactical planning centered around what was to be accomplished by the pre-H-Hour air and naval bombardment and the final coordination of the various outline plans. For example, the enemy-held islands of Levant and Port Cros were a definite menace to the 3rd Division beaches on Cavalaire Bay. The Navy was insistent that these hostile shore batteries be neutralized, or else assault shipping in this area would be within easy gun range. This assignment was given to the First Special Service Force which was to land under cover of darkness on the night prior to D-Day.

The pre-D-Day bombing plan envisioned attacks on enemy lines of communications in northern Italy and southern France. The target area was to be isolated by the destruction of road and railroad bridges. At the same time, however, a general bombardment was to be kept up along the whole Mediterranean coast. The enemy was to be given the impression that the main assault might come either in the Genoa area or at Sete near the Spanish border. On D minus 1 the bombing attack was to shift to the islands of Levant and Port Cros and on D-Day to the assault area to neutralize coastal batteries and support ground operations.

The question was also raised of the advisability of postponing H-Hour from 0800 to 0900 hours. The contention was that "an effective naval bombardment could not be carried on simultaneously with that from the air." Dust and smoke would interfere with the observation of spotting planes. The Spotters might mistake bomb bursts for shell bursts and consequently confuse the control of naval fire. There were, however,

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

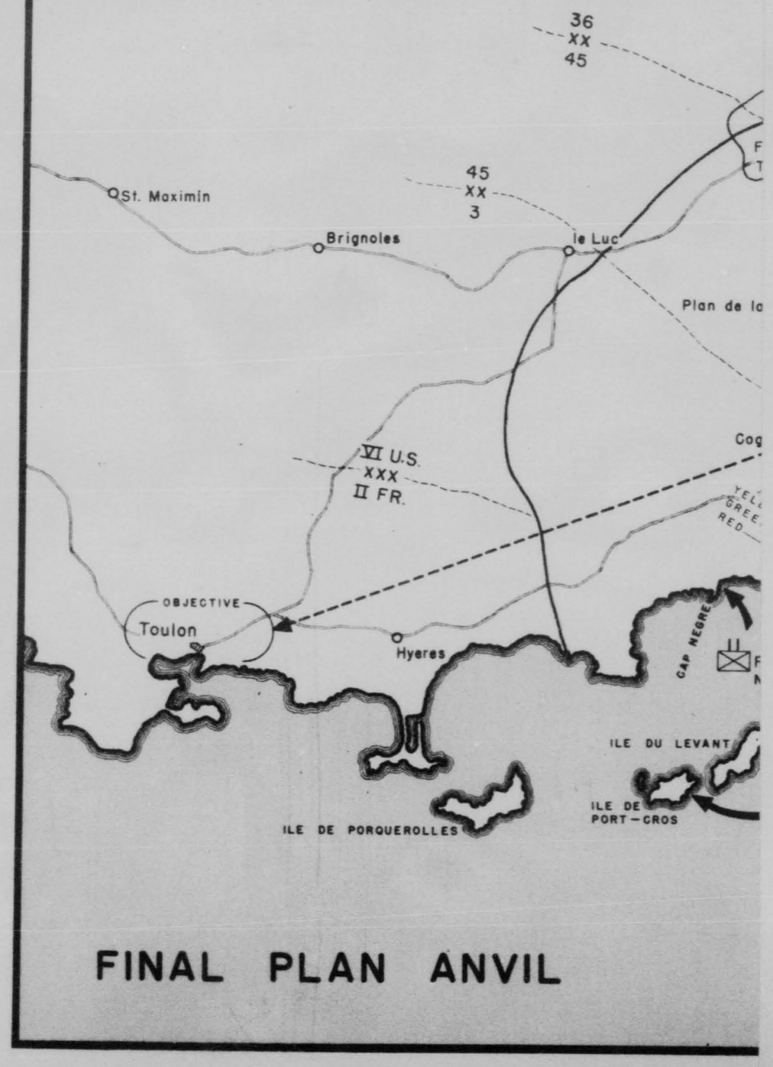
many disadvantages to prolonging the pre-H-Hour neutralization effort. It was decided that "the 0800 H-Hour should stand", and that the air attack and naval bombardment must be concurrent.

ANVIL becomes DRAGOON

By direction of the Combined Chiefs of Staff, after 1 August the word *ANVIL* was no longer used. The operation would now be referred to as *DRAGOON*. So-called "Bigot" security instructions and procedure remained in force.

On the same date the Supreme Allied Commander's Conference made several important decisions regarding pre-H-Hour activities. General de Lattre had previously suggested that the forest regions in the Maures Mountains northeast of Toulon should be burned by the Air Corps prior to D-Day. The extremely dry timber, heavy underbrush and prevailing winds, he stated, constituted a great fire hazard. However, it was decided at the 1 August conference that there would be "no intentional burning of these forests". Plans were to be drawn up to cover a twenty-four hour delay in H-Hour "which might be necessitated by unfavorable weather conditions". Further details for the deceptive bombing plan of the Mediterranean area were discussed, and it was decided that Sete should have an additional attack by heavy bombers on D minus 5.

Whether the invasion force could actually make the landing without drastic interference from under-water obstacles was a question which troubled General Truscott. On 1 August he told Admiral Hewitt, "I do not believe we can justify sending an assault onto a beach until we have ascertained by actual reconnaissance that assault craft can actually reach the beach . . ."



"I believe," Admiral Hewitt replied the next day, "that the menace of underwater obstacles has been somewhat exaggerated . . ." Last minute reconnaissance would disclose, he argued, only little new information, and would "seriously risk disclosing the *exact* beaches in which we are interested". The difficulties of *OVERLORD*, which had been a special condition of the English Channel and the Normandy coast,

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

FINAL PLAN ANVIL

he felt, had now become a mental hazard. The admiral believed that neither factors of bathymetry or tidal range nor the crucial element of tactical security substantiated the new fears and suggestions. "I know of no preliminary reconnaissance, other than actually running boats through the obstacles, which will *ensure* that boats can beach . . ." he wrote. In the event that LCVPs could not push through, LCTs would most certainly be used to ram any remaining obstacles in order to insure a successful landing.

During the first weeks of August, tactical planning was brought to its final conclusion. Instructions to the Commanding Generals of the U.S. VI Corps and French Army B were completed. The pre-H-Hour attack on the islands of Levant and Port Cros was changed from 0100 hours on D-Day, with vessels 26 miles off the coast at dusk to 0130 with the ships 35 miles off shore at dusk. If they came in too close enemy radar might be alerted or movement observed visually.

Final Outline Plans

Although small details were subject to change up to the very moment of sailing, the broader aspects of *ANVIL*'s tactical concept stood firm. The following paragraphs briefly sum up the final ground, naval and air plans for the operation.

"*Army Ground and Airborne Plan*": The general mission was to establish a beachhead east of Toulon as a base for the assault, to capture Toulon and then Marseille and exploit towards Lyon and Vichy. For reasons of security and convenience the various forces were given code names according to their missions.

Kodak Force consisted of VI Corps Headquarters, and its assigned units: the 3rd, 45th, and 36th Infantry Divisions, plus one French Armored Combat Command and supporting troops. Kodak's mission was to land three infantry divisions (reinforced) at H-Hour over the beaches between Cape Cavalaire and Agay. A rapid advance was to be made inland to contact the Airborne Task Force. As soon as the beaches were cleared the French Armored Combat Command would land. The beachhead was to be extended to the "Blue Line", the D plus 2 objec-

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

tive, and airfield sites secured in the Argens Valley between Frejus and Le Muy. Further advances to the west and northwest would protect the right flank of the Army; after the II French Corps was established ashore, contact was to be maintained. Kodak would be prepared to release the French Armored Combat Command, the French Groupe de Commandos, and all airborne forces to Army control on Army order.

Garbo Force consisted of Detachment, Headquarters French Army B, French II Corps with the 1st French Motorized, 3rd Algerian, and 9th Colonial Infantry Divisions plus the 1st French Armored Division (less 1 Combat Command) and supporting troops. Landing over beaches in the St. Tropez-Cavalaire Area on D plus 1, it was to pass through the left of the U.S. VI Corps and capture Toulon. By D plus 9 the French 9th Colonial Division, and two attached groups of Tabors (Gourniers) were to be landed in the Le Lavandou-Hyeres area. The remainder of the 1st French Armored Division was to land by D plus 25. After the capture of Toulon the attack was to be continued against Marseille and to the northwest. Contact on the right would be maintained with U.S. VI Corps.

Rugby Force consisted of the Seventh Army Provisional Airborne Division composed of the 2nd British Independent Parachute Brigade, one Parachute RCT, two Parachute Battalions, one Infantry Glider Battalion and supporting troops. It was to land on the high ground north and east of Le Muy and on the high ground north of Grimaud. The primary mission was to prevent the movement of enemy forces into the assault area from the west and northwest. Prior to dark on D-Day, Le Muy was to be cleared of enemy forces and the area secured for subsequent glider landings. Thus, Rugby Force would assault enemy positions from the rear and assist the advance of seaborne forces by neutralizing enemy installations to the east within the range of weapons. Bridges in the Airborne Division area were to be prepared for demolition, but no bridges were to be blown except on order of the Task Force Commander. Upon contact, the Rugby Force would pass to U. S. VI Corps control and would revert to Army reserve on Army order.

Sitka Force or the 1st Special Service Force was to land under the cover of darkness prior to H-Hour and neutralize all enemy defenses

on the islands of Port Cros and Levant. It would subsequently be prepared to withdraw to the mainland and reorganize as the *Satan Force* for the capture of the Island of Porquerolles.

Romeo Force or the French Groupe de Commandos was to land under cover of darkness prior to H-Hour and destroy enemy defenses on Cape Negre. The coastal highway in the vicinity of the Cape was to be blocked and the high ground two miles to the north seized. It would protect the left flank of the assault and upon contact would come under control of the U.S. VI Corps and revert to Army reserve on Army order.

Rosie Force consisted of the French Naval Assault Group a demolition party, which was to land in the vicinity of Pointe des Trayas on the night before D-Day. Its mission was to execute demolitions on the Cannes - St. Raphael and Cannes - Frejus roads and then fall back on the Army right flank.

Naval Plan. The mission of the Eighth Fleet was to establish the Seventh Army firmly ashore and to support its advance westward for the capture of Toulon and Marseille. The Fleet was responsible for the Army build-up and maintenance on the beach until no longer required after the capture and utilization of ports. It was to be subdivided into six forces, each with a specific mission.

The Control Force was to provide naval beach control and establish and operate naval fuel facilities on shore in the assault area. Navigational markers and air beacon markers were to be established, and diversionary operations conducted. The Control Force would protect the assault convoys from hostile surface or submarine units, and would provide convoy control and escort for shipping outside the assault area.

Alpha Attack Force was to establish the 3rd U.S. Infantry Division on selected beaches in the Pampelonne-Cavalaire area beginning at H-Hour on D-Day. By D plus one it would be prepared to land advance units of French Army B. It was to receive and place five pontoon causeways on Beach 261 and five on Beach 259 and at the earliest possible opportunity unload special Air Force equipment on the Island

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

of Port Cros. Its naval gun-fire would neutralize enemy batteries threatening transports, landing craft, or the beaches themselves.

Delta Attack Force was to establish the U.S. 45th Infantry Division on selected beaches in the St. Tropez-Bougnon area beginning at H-Hour on D-Day. Five pontoon causeways were to be delivered that day to Beach 261, and the port facilities of St. Tropez exploited. By D plus one the Force was to be prepared to assist Alpha Force in landing French Army "B" over selected beaches in the St. Tropez area.

Camel Attack Force was to establish the U. S. 36th Infantry Division and one Combat Command of the 1st French Armored Division on St. Raphael Antheor beaches beginning at H-Hour on D-Day. As soon as the beaches were cleared, it was to prepare to land another French Combat Command. The Force was to insure that the proper number of pontoon causeways were delivered to Beach 259 for unloading French armored equipment, insure the safety by special measures of Troop Carrier aircraft, and expedite the unloading and turn-around of Air Force LST shuttles from Corsica. Its naval gunfire was to neutralize threatening enemy batteries.

Support Force was to establish the 1st Special Service Force *(Sitka)* on the islands of Levant and Port Cros, and the French Groupe de Commandos *(Romeo)* in the vicinity of Cape Negre. Its bombardment would support the military operations, and after the initial assault phases the Force was to support the Army's westward advance and assign necessary sweeping forces.

Aircraft Carrier Force, the sixth of the Eighth Fleet's subdivisions, was to provide the maximum fighter protection, spotting aircraft, and close support missions. It was to be prepared to transfer aircraft to captured airfields, and would provide its own protection against enemy air and submarine forces.

Air Plan. The Commanding General of the XII Tactical Air Command, Brigadier General Gordon P. Saville, was designated the Air Task Force Commander and charged with all detailed air planning for operation *ANVIL*. From the point of view of time, air operations were broken down into four phases: I. Air offensive operations prior to

BRIG. GEN. GORDON P. SAVILLE
. . . detailed air planning . . .

D minus five. II. Period D minus five to 0350 hours D-Day, known as Operation *NUTMEG*. III. Period 0350 hours D-Day to H-Hour (0800 hours), known as Operation *YOKUM*. IV. Period after H-Hour, known as Operation *DUCROT*.

From the functional approach air operations were further subdivided into: (1) Offensive operations, (2) Defensive operations, (3) Air-Sea Rescue operations, (4) Tactical Reconnaissance, Artillery Reconnaissance and Naval Gunfire Spotting, and (5) Troop Carrier operations.

Air offensive operations in support of *ANVIL* actually began as far back as 28 April 1944 when heavy bombers attacked Toulon. Between then and 10 August, during the preliminary air phases of *ANVIL*, Mediterranean Allied Air Force had dropped more than 12,500 tons of bombs on southern France. Phase II (Operation *NUTMEG)* beginning on 10 August was to continue offensive Air Force responsibilities by attacking enemy coastal batteries, radar stations and harassing coastal defense troops while at the same time isolating the target area by the destruction of highway bridges across the Rhone River.

In order not to jeopardize tactical surprise this phase was to be carried out simultaneously with a cover plan which included the bombardment of identical targets between Via Reggio in Italy and Beziers near the Franco-Spanish border. The intensity of the cover plan, it was hoped, would be sufficient to conceal true Allied intentions until about 1800 the evening of D minus one.

Phase III (Operation *YOKUM)* would begin one hour after the conclusion of *NUTMEG* and last until H-Hour. Its purpose was to cause maximum destruction to enemy coastal and beach defenses utilizing all available forces. Twelve groups of escorted heavy bombers plus all available medium and fighter bombers were allocated for the attack. Fighter and medium bombers were to attack enemy coastal guns seen

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

firing, while formations of heavy and medium bombers carried out attacks against the assault beaches with the object of beating down underwater obstacles and of destroying beach defenses.

Phase IV (Operation *DUCROT*) beginning after H-Hour would continue the offensive started in Phase I to interdict enemy communications. This was not only to complete destruction of bridges on the Rhone and Isere Rivers and to extend the area of isolation outwards but also to give close tactical support to ground forces by fighters and fighter-bombers.

The plan for air defensive operations provided a constant air cover, both by day and by night, of fighter and night-fighter aircraft. Escorts were also to be furnished to bombers and troop carrier planes unless specifically charged to some other command. Fighter sweeps and area cover were to be provided in accordance with the demands of the situation and the availability of fighter aircraft.

Plans for tactical reconnaissance and aircraft spotting emphasized both the rapid transmittal of information by broadcasting in "the clear", the size and location of enemy concentrations, and accurate observation and direction of naval gunfire. Naval spotting missions were also to be used for field artillery until the Army's own observers were in a position to take over the work.

The Provisional Troop Carrier Air Division was assigned the mission of lifting the Seventh Army Airborne Division consisting of both parachute and glider-borne troops. Subsequent missions were to include re-supply of airborne units and air evacuation. From home bases in Italy 32 squadrons of troop carrier planes totalling 415 aircraft were to fly to the target area in nine ship Vee of Vees for aircraft carrying paratroops and in Pair of Pairs echeloned to the right for towships with gliders. Beaufighters and Spitfires were assigned to provide air cover. The first jumps were to be made just before daylight on D-Day, and the first re-supply mission was planned for the late afternoon of the same day. For purposes of identification routes were chosen with great care and beacon ships were spotted along the route to assist in

navigation. Planes were also to show amber colored recognition lights up to 40 miles from the French coast enroute to the drop zones.

Final Supply Planning

Pre-planning accomplished by Force supply services during the long period of uncertainty which surrounded *ANVIL* constituted a firm base for consummation of necessary arrangements after a decision had finally been made to mount the operation. Definite responsibilities had been assigned.

The Commanding General, Seventh Army, was to coordinate with the Commanding General, SOS NATOUSA, for the assembly of all supplies at various ports and their movement into the combat zone. The task force commander was to be responsible for the supply of all troops assigned and attached to, or in support of his force in the initial phases. The responsibility included the movement of all supplies from ship or craft over the beaches or through such ports as were available until, on order of the Force Commander, Beach Group Control Headquarters assumed the mission on behalf of the Army. It was contemplated that the Commanding General, Base Section, would assume these responsibilities upon the arrival of the first convoy in a major port, about five days after capture of such a port. For the first 60 days supplies were to be forwarded by SOS NATOUSA, and thereafter as requested by Base Section.

The plan specified that SOS NATOUSA would assist in the movement of troops, baggage, equipment, and vehicles to ports; stow in accordance with the wishes of the sub-task force commander; and load out. The transport quartermaster would supervise stowage in conformity to Army wishes and direct debarkation. For coordination of operations, Near Shore Control Groups were established by Colonel Harvey, A. C. of S., G-4, in each of the loading-out ports to carry out the Force Commander's orders until completion of the movement.

Planning for maintenance of the operation proceeded on a phased outline, published 15 April, which constituted the guide to which the variable factors of strength in personnel, vehicles, and weapons, and availability of shipping were applied. Phased maintenance plans

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

specified quantities of supplies and materials to be brought ashore as individual reserve, beach or unit reserve in the first 30 days in six convoy periods of five days each, and levels to be built up gradually and maintained. Each convoy was to bring in supplies above the calculated daily consumption rates with the result that in practically all classes of supply there would be developed a 20-day reserve in Army depots plus a ten-day operating level pending establishment of bases for stockage of theater reserves. The build-up of ammunition was to be to the theater level of ten units of fire with the unloading of the D plus 50 convoy.

Some Changes Necessary

Soundness of the planning in preparation of the phased maintenance outline was demonstrated in the relatively few changes that were necessary although the tactical plan had varied from a one-division to a three-division assault. Reduction in the shipping allocation, however, dictated a change in late June affecting the ration and gasoline receipts during the first five days ashore. Experience in other amphibious operations within the theater dictated the necessity of planning for conditions in which the inland advance would be slow. A 20 percent reduction, therefore, was ordered in the gasoline lift for the D to D plus four period; and the unit reserve of rations for the same period was reduced from ten to seven, with three added to the second ten-day period. Phased maintenance provided for the assault convoy to lift seven days' supply of motor fuel and lubricants, based on a daily consumption expectancy of six gallons per wheeled vehicle, 30 gallons per halftrack, and 60 gallons per tank, with proportionate amounts of engine oil and greases.

Revised tactical plans in June calling for a faster build-up of troops in the D to D plus four period and an assault by three instead of two divisions necessitated alteration of phased requisitions. But by 6 July the A. C. of S., G-4, was able to report that all requirements for the D to D plus 30 period had been incorporated in phased requisitions. Changes were made to reflect arrival on the far shore in the initial five-day period of a French Corps Headquarters with an armored division and a provisional airborne division, together with the three assaulting

divisions. The troop list totalled 170,115 personnel and 25,191 vehicles. Subsequent alterations corrected the totals to 155,419 personnel and 20,031 vehicles in the 30 July troop list. The build-up would put 556,833 personnel and 56,051 vehicles on the far shore by D plus 30 and 576,833 personnel and 91,341 vehicles by D plus 65.

For support of this force supply services had phased requisitions to put 277,696 tons over the beaches in the first 30 days, of which 188,339 tons were estimated to be cleared and 89,357 tons to accumulate. It was anticipated that 108,206 tons would be moved over Alpha Beach, 74,109 tons over Delta Beach, and 95,380 tons over Camel Beach.

Two Day Aerial Resupply

Formation of the First Airborne Task Force for an operation in conjunction with the seaborne assault required the creation of a resupply system by air commencing D-Day and continuing until junction was effected between the two forces. The airborne force was assembled in the vicinity of Rome; and there a Quartermaster depot supply company, trained in aerial resupply and assigned to Seventh Army, was to lay down seven days' supply. Stocks were to include weapons of all types to replace battle losses, packaged in containers of various types to be dropped from C-47 aircraft on call. It was anticipated that aerial resupply of the force would be required for at least two days.

Fluctuations in the allocation of shipping and craft precluded firm planning until definite decisions were made. Schedules were developed for lifting a three-division assault with a D-Day force of approximately 84,000 personnel and 12,000 vehicles. A follow-up lift to reach the target area by D plus four of one armored division and one combat command would bring in 33,500 additional troops. Only minor modifications of the three-division assault plan were necessary in the final allocating of shipping.

Limited availability of shipping prohibited the necessary vehicle lift by assault craft alone. Consequently, the required lift was obtained by flatting Merchant Transport stores ships with cargo and stowing of maintenance stores above the flatting to the extent permitted

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

after accommodations of critical vehicles and personnel. Ships thus preloaded were distributed within the task force in conformity with the tactical plan. Cargo was limited to approximately 1,000 tons per ship, a volume which could be discharged within a five-day period and prior to arrival of the succeeding convoy.

One hundred preloaded M/T stores ships were used in the assault and immediate follow-up convoys. The remainder of the shipping maintenance plan was based on receipt of 25 M/T stores ships each five days.

For control of the supply function peculiar to an amphibious operation, the movement of equipment and supplies from ships offshore to army dumps on the beaches, the Beach Control Group method was followed in planning. Control of beach operations by Engineer beach groups would be under the sub-task force commander during the assault phase, after which it would pass to the Army. Coordination was to be accomplished by a Beach Control Group Headquarters, functioning under the Army A. C. of S., G-4, and employing the beach engineer groups which would come ashore with each assault division. It would be the operating agency needed on the beaches with personnel trained in shore operations, unloading methods, traffic control, maintenance of craft and vehicles peculiar to amphibious operations, and logistics.

With the target date less than a month away, the provision of French troops constituted a problem in the final planning phase.

French Supply Problems

Little was known initially of the French supply status or readiness for combat, and French commanders had not been briefed for the operation. Discussion with them and their supply agencies had been forbidden until late in July. Though French planning personnel was available on 22 March, complete liaison was not secured until 1 July. Lower echelons of the French elements lacked information on *ANVIL* and needed orientation on the American supply system and nomenclature. Language differences were a difficulty.

Inspections disclosed that the French were very short of supply, on the basis of their tables of equipment. On 21 July only 30 of 133 units had more than 30 percent of their authorized equipment. According to our standards, the French were not ready for combat. Except for Medical and Ordnance, however, the French considered themselves capable of providing their own support. When on 8 July Seventh Army was delegated authority to exercise normal functions of command to deal directly with French Army B on training and equipment, the resources of the Force supply services were devoted to preparing those units for participation in the operation. The French were to be equipped from stocks of supplies available to the French army through the Joint Rearmament Committee. Deficiencies would be made up from American stocks by SOS NATOUSA and charged to the French Lend-Lease account.

As the target date approached, all units were inspected for serviceability of equipment. Final shortages were filled. Loading plans were completed down to the detail of each person and each vehicle and weapon. In ports on two continents and on the island of Corsica representatives of the A. C. of S., G-4, remained to coordinate between Base Section and departing units, set priorities, assist in filling shortages, and forward emergency supplies.

Brigadier General Paul B. Kelly, Seventh Army Antiaircraft Officer, commanded the Near Shore Control Headquarters upon which responsibility for administration devolved once the Army Headquarters had embarked upon the invasion. General Kelly's headquarters was set up in down-town Naples and had the responsibility for seeing to it that post-D-Day troops and supplies were shipped in accordance with the master plan.

It was estimated that Toulon, the first port to be developed, would fall by D plus 15, would be operational by D plus 20, and would be established sufficiently as a supply base ready to function by D plus 25. The D plus 20 convoy would unload at Toulon, which would be developed ultimately to handle 10,000 tons of military supplies daily. Unloading over the beaches would be necessary for at least 20 days;

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Marseille, it was estimated, would not fall prior to D plus 40; no major river crossing would be undertaken prior to D plus 45. These were the assumptions on which plans were based.

The invading force was so composed, the Supreme Allied Commander in the Mediterranean estimated, that before the capture of Toulon and with supply only over the beaches it could support itself for exploitation inland to a depth of not more than 20 miles. This was a serious limitation.

Instructions to French Resistance Groups

The planning of *ANVIL* placed no little emphasis on the possible tactical contribution of the French Forces of the Interior. The French Maquis or FFI were scattered over a wide area, but their strength and capacities for guerrilla warfare varied from locality to locality. It was thought that there were about 15,000 to 20,000 trained and armed members of the FFI with perhaps 30,000 to 40,000 more mobilized but unarmed. Two areas in particular, that between Aix-en-Provence and the Rhone River and that east of Grenoble in the high Alps, were considered to be virtually under the control of French Resistance Groups.

Maintenance of contact with the FFI, both by radio and flow of agents, had reached a high state of development and had long since proven an excellent source of intelligence regarding the target area. Most dealings with the FFI were conducted on the AFHQ level. Obviously the proper and skillful handling of the FFI potential, both before and after the invasion, was a matter of the utmost importance. The basic consideration adopted was that the action of the resistance forces must afford the maximum support to Allied operations on the continent. There was no time for romantic or sentimental gestures.

General Cochet, appointed by General De Gaulle as commander of the FFI for Operation *ANVIL*, submitted his plan to the Supreme Allied Commander, Mediterranean Theater, for approval. By means of Special Projects Operation Center under G-3, AFHQ, a list of priority targets to be attacked on and after D-Day was submitted to the

FFI late in July. The FFI were to intensify their activities in the rear of those enemy forces directly opposing *ANVIL*, with special emphasis on destruction of bridges, cutting and blocking roads and railroads, and seizing or controlling telephone and telegraph lines.

Command channels for the FFI were to be directly under the Commanding General of the Seventh Army and were to be entirely independent and apart from French Army B. General Cochet was to land with the assault force in order to take over active command on French soil as soon as possible. On 8 August, however, General De Gaulle advised that in view of transmitting orders and instructions to the FFI during the early phases of the operation it would be preferable for General Cochet to remain in Algiers which was the communications center for the French Underground. General Cochet was thus replaced by Colonel Boutand de Lavilleon as the official representative on FFI and Civil Affairs matters.

Finally, a Special Operations Group was charged with assisting the French Resistance Groups by delivering troops and supplies in areas held by the FFI. The Maquis, under this coordinated plan, would be able to render the maximum assistance to the overall military effort.

Civil Affairs

Seeking the maximum cooperation from the French civilian population and a minimum of interference with operations against the enemy, the Commanding General of Force 163 had indicated on 1 March 1944 that a Civil Affairs detachment of 200 officers and 400 enlisted men would be necessary to administer efficiently the area assigned to *ANVIL*. A civil affairs organization had been created previously and had trained near Algiers. Every effort was made to coordinate the work with the parallel organization in the United Kingdom which was preparing to administer northwestern Europe. But until 23 February no formal relationship existed between the detachment and Force 163.

The main objective of the contemplated Civil Affairs program was to relieve combat troops of such civilian administration as they might otherwise be called on to perform. The program envisaged cooperation with the appropriate staff section or military agency in the

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

maintenance of public order and the restoration of the health, welfare, and internal economy of the liberated regions. The Civil Affairs detachment was charged with making available for military use all local resources and man power necessary to support the operation.

The responsibility for Civil Affairs remained, of course, with the Commanding General, but this direction was exercised through the senior Civil Affairs Officer, Colonel Gerry, who, on 24 July, received his new title as Assistant Chief of Staff, G-5. Personnel of the Civil Affairs Regiment was largely American and British. French Officers were available to handle most of the liaison work with the French local government authorities. This was particularly true with regard to directing the functions of services needed for military operations.

In addition to the administrative sections there were a number of specialist branches such as civilian supply, public health, welfare, finance, refugee control, a legal department, transportation, price control, property control, monuments, fine arts, education, industry, commerce, utilities, and communications. Each specialist branch operated under a chief who might serve as a specialist staff officer with Army Headquarters. Detachment personnel were to be assigned specific territorial or functional responsibilities or might be attached for supplementary use to operational military units to meet special problems or be assigned to rear area duties. Of necessity plans for civil affairs personnel had to be kept flexible and closely integrated with the tactical situation.

Probably the most important aspect of the anticipated Civil Affairs program was that of civilian food and medical supply. The situation in southern France was understood to be critical; and it was planned to bring in three Liberty ships per convoy from D plus 10 until D plus 40 and thereafter four ships per convoy until D plus 80. All shipments were to come direct from the United States except edible oils which had been stock-piled in North Africa. Distribution was to be made by the French local authorities under the supervision of Civil Affairs Officers. In its largest aspect the function of G-5 "was to assist in furthering the national policies of the United States and the United Nations as determined by higher directives."

CHAPTER IV

Training

SINCE no units were assigned to the Seventh Army until the middle of June, 1944, — some service units did not, as a matter of fact, come under Seventh Army control until just prior to loading the assault ships, — the time available for training in preparation for the Southern France invasion was very limited. There was, however, sufficient time for the principal combat elements of each of the three American sub-task forces to undergo a three weeks refresher course in amphibious assault. The 36th and 45th received their instruction at the Invasion Training Center at Salerno, Italy. The 3rd Division went to Pozzuoli, Italy, where it underwent amphibious training under its own Division Commander.

The training program was adequate because most of the divisions, both American and French, as well as the service units, had had combat experience. The 3rd United States Infantry Division had participated in the Moroccan, Sicilian, and Italian campaigns. The 45th United States Infantry Division got its first battle experience in the Sicilian campaign. The 36th United States Infantry Division made the initial landing at Salerno in the Italian campaign and fought along with the 3rd and 45th in the breakthrough at Anzio and in the subsequent advance through Rome northward toward the Pisa-Rimini Line.

Of the immediate follow-up forces the 1st French Infantry Division and the 3rd Algerian Infantry Division had been in the line during the winter months of the Italian campaign and had taken an important part in the May breakthrough. They had then struck forward from the Cassino area to a position north of Sienna, an advance of some 190 miles. The French 9th Colonial Infantry Division, also part of the follow-up forces, had made an amphibious assault against the island of

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Elba and had overcome stubborn resistance in capturing the German garrison. The other French units had undergone a period of approximately twelve months' training in North Africa.

The service units of the newly reconstituted Seventh Army were, to a great extent, those which had worked with the divisions mentioned above in the African, Sicilian, and Italian campaign. Their training placed special emphasis on the organization of various service troops into three Shore Groups to operate the beaches in the three division assault areas until this function could be taken over by the Base Section. Using three experienced engineer regiments as miniature base sections and adding components of all branches of service and supply troops, the command trained these groups as teams.

Naval and Air Force units of the Mediterranean Theater had been actively engaging the enemy since the beginning of the invasion of North Africa. This action included participation in amphibious landings in North Africa, Sicily, Salerno, and Anzio. The Naval Western Task Force organized the convoys to transport the Seventh Army and trained special groups to assist in the assault and to direct naval gun fire support. The Mediterranean Allied Air Force organized and prepared the airborne task force and regrouped air strength to assist the assault.

Establishment of Training Schools

The initial success and rapid advance of the invasion of southern France can be attributed, in part, to careful and thorough amphibious training. Training was designed to prepare the forces for the actual problems of landing. The program's mission was to acquaint them with the use and care of new equipment and techniques, to coordinate the maximum usefulness of the several arms of the service, and to review the best practices of modern warfare. Every effort was made to achieve realism.

As early as 13 March 1944, the Commanding General of Force 163 recommended the creation for a joint Army-Navy Beach Obstacle Board, composed of one member from the Invasion Training Center,

two from the Navy, and three from Seventh Army Headquarters. The mission of the Board, which included Captain John Chamber, Seventh Army Engineer Section, was to investigate possible means of breaching underwater and beach obstacles, to make recommendations to corps and division commanders, and to assist in the procurement of the necessary demolitions and equipment to perform this work as efficiently as possible. A detailed study was made of Beach 264-A (St. Raphael) as a basis of training. Beach 264-A had previously been recommended by General Davidson and approved by General Patch as one possible site for an initial landing. Furthermore, this beach was considered one of the most heavily defended in the target area.

On 20 and 21 June a demonstration of equipment and techniques was conducted at Salerno. The Air Corps showed the results of hitting beach defenses with showers of small-sized aerial bombs, specially designed with fuses on sticks attached to the nose of the bomb. These bombs exploded several feet above the ground, effectively cutting wire obstacles and detonating mines. The Navy shelled beach defenses with heavy guns and sent in Apex boats, Drone boats, Reddy Foxes, and Rocket ships. The Apex boat is a small radio-controlled craft which tows, at an angle, two Drone boats. The latter are small craft filled with explosives to be detonated from the control radio of the Apex boat. Reddy Foxes are a nautical adaption of the Bangalore torpedo, consisting of a section of pipe filled with explosives floated into position over underwater obstacles, sunk, and then detonated by remote control. Rocket ships are LCTs equipped with launchers for up to 1,000 rockets, to be fired in mass at beach defenses by the crew.

Army gapping teams demonstrated the tank 'dozer-scarifier, a medium tank equipped with plow-type bulldozer blade for rooting up mines and beach obstacles. In addition there was the Churchill tank with bridge, a tank topped with a box-girder bridge ramp which might be lowered to transform the tank into the center pier of a bridge to cross antitank ditches. There were also other demonstrations with breaching charges and the T-40 rocket launcher. After each, an appraisal was made of the limitations and capabilities of the various weapons exhibited.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

In the actual course of Operation *DRAGOON*, all of the above items were used with the exception of Reddy Foxes, which though available, proved unnecessary. Their "combined efforts", it was later noted, "added to the softening process of the pre-H-Hour bombing and made the assault landing easier."

Invasion Training Center

The Invasion Training Center, commanded by Brigadier General Henry C. Wolfe, was moved from Port-aux-Poules, Algeria, to Salerno, Italy, during the spring of 1944. In compliance with an order from Allied Force Headquarters the Invasion Training Center established a school for one week's instruction in water-proofing, principally for officers from Mediterranean and Northern base sections from which *ANVIL* units were to be mounted. At the completion of the course these officers returned to their sections to conduct schools for the instruction of officers and key NCOs in Seventh Army service units. Representatives of units within Peninsular Base Section (Italy) and personnel of all divisions during their stay at the center attended the water-proofing school itself. For troops scheduled to arrive in the assault area after D-Day, weather-proofing rather than water-proofing instruction was given.

On 10 June 1944 control of the Invasion Training Center was transferred from Allied Force Headquarters to Seventh Army for closer supervision of final aspects of amphibious training. Upon release from the Fifth Army, it was originally planned that divisions comprising VI Corps were to be given training in accordance with the recommendations of the Army-Navy Beach Obstacles Board on the following schedule: 45th Division, 24 June to 14 July; 3rd Division, 28 June to 14 July; and 36th Division, 6 July to 30 July. This schedule was later modified because both the 45th Division and the 36th Division arrived in the vicinity of Salerno during the latter part of June and received training simultaneously during the first weeks of July. The 3rd Division, as aforesaid, did not train at Salerno but conducted its own school at Pozzuoli with the advice and assistance of the 1st Naval Beach Battalion

from the Invasion Training Center. Since the division had been trained for three previous invasions, North Africa, Sicily, and Anzio, the training program during the month of July at Pozzuoli was more or less a general review of amphibious techniques with the introduction and demonstration of new weapons and equipment.

The Salerno site was well selected. The memory of former experiences on this terrain created an atmosphere of grim realism and a thorough appreciation of the necessity for proper preparation. "Quite

36TH DIVISION TROOPS DEBARK 'UNDER FIRE'

". . . from the lessons previously learned there had been hardly time to forget . . ."

a contrast then and now!" wrote a member of the 171st Field Artillery Battalion. "The same beaches, the same hills, the same dust and sand; but conditions have altered the situation and, though we almost expected the whine of shells and the roar of German planes, we found a refreshing, reassuring stillness, serene and peaceful."

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

The proximity of the sea was ideal for practice in loading and unloading vehicles and personnel, beach assault exercises, and swimming both for training and recreation. The nearby mountains were excellent for instruction in patrolling, wire and radio, map and compass; they were also used for hikes and general physical conditioning. Ranges were available for firing all types of weapons. Rubber models of terrain features, along with sand and clay tables, helped to make vivid the assault objectives. Combat spirit and infantry tactics were emphasized in order to weld replacements into a fighting team.

Infantry Training

The nine infantry regiments composing the 3rd, 36th and 45th Divisions were given a brief review of regular infantry warfare and specialized training in demolitions and amphibious assault. Their training period also served to refit and restore equipment lost or worn out during the Italian campaign, and to receive and absorb replacements. As much rest and recreation as could be fitted into the brief period was allowed. To soldiers long in combat this was an outstanding feature of the period.

The general schedule for demolition training consisted of a 90 minute lecture by officers preceding demonstrations by engineer troops which covered the general field of military explosives. This course introduced the types and nature of American and British explosives, fuses (safety and instantaneous), the handling of caps, the preparation of charges, the use of primacord, the nature and fusing of Bangalore torpedoes, the preparation of pole and satchel charges, and the application and effect of shaped charges. This phase was followed by another 90 minute period of practice work; under the supervision of the Engineers each soldier prepared a charge.

After basic principles of handling explosives the program continued with a lecture and demonstration of underwater obstacles, beach obstacles, and the neutralization of obstacle-defended beaches. Work was also done on special demolition charges and special equipment to be used with armor. Practical demonstrations were given in the destruction

of tetrahedrons, dragon's teeth, pillboxes with doors of wood or steel, German wire obstacles, double-apron barbed wire fences, and concertinas. Experiments were carried out with placed charges to breach antitank walls, destroy concrete cubes, or horned scullies, and to fill antitank ditches.

The men already had a grim familiarity with the use of mines in modern warfare. Problems involving both Allied and Axis antitank and antipersonnel mines, mine field patterns, marking of mine fields, methods of neutralizing mines, use of various types of mine detectors, probing and mine lifting methods employed their old experience on a more detailed level.

Boat teams were given assault training, demonstrations and "dry runs", critiques of "lessons learned". Special attention was paid to the clearance of both underwater and beach obstacles. The methods recommended by the Joint Army-Navy Beach Obstacle Board were introduced: eight-man DUKW teams from the engineers were to be used to widen and to mark gaps through underwater obstacles. Infantry boat teams which were to land in the first wave were taught to destroy beach obstacles with wire cutters, pole charges, and Bangalore torpedoes, and to assault pillboxes with demolitions and flame throwers.

In addition to specialized training, the infantry schedule included 25 mile marches, close order drill and calisthenics, extended order drill, orientation, bayonet and rifle drill, chemical warfare training, security lectures, semaphore signaling, terrain study, and sketching. Inspections were made of gas masks, weapons, equipment, identification tags, and pay books. While the troops were being trained, their equipment was brought up to standard.

Artillery Training

The artillery units of the 45th and 36th Divisions received training at the Invasion Training Center between 1 and 17 July. This training consisted primarily of the use of artillery weapons under amphibious conditions and involved the loading and unloading of 105 mm howitzers from DUKWs, firing from DUKWs both on land and

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

on water, and the use of A-frames in unloading howitzers. Other phases included the firing of small arms and machine guns at aerial-towed targets, reconnaissance, and occupation of positions. Classes were held

THE LATEST DUKW IN THE FINAL DRESS REHEARSAL

. . . new techniques were introduced and old ones reviewed . . .

in security, communications, surveying, photo-interpretation, map reading, swimming, and physical conditioning.

In order to direct naval fire on particular objects that might hinder the infantry's advance before the field artillery units were in action, Naval Shore Fire Control parties were organized and trained to accompany infantry battalions. On 27 July, 19 Field Artillery lieutenants and 144 enlisted men were attached to the units of Seventh Army.

Officers and enlisted men had been drawn from a replacement depot. Under the supervision of the Seventh Army Artillery Section their training had taken place since early spring in the vicinity of Arzew,

Algeria, with the United States Navy, and at Salerno with the Invasion Training Center. Eighteen parties were organized from this personnel; and twelve additional parties were formed from divisional artillery of the 3rd, 36th, and 45th Infantry Divisions. A complete party of the Army Section consisted of one Field Artillery lieutenant, five enlisted men, one one-quarter ton truck, and two radios, and the Navy Section of one Naval Officer, four enlisted men, one one-quarter ton truck, one one-quarter ton trailer, and two radios. A "half party" was made up of the Army Section only. Each division had attached eight full parties and one half party; the 1st Special Service Force had three full and one half parties.

The parties were attached one to each assault battalion and by means of radio communication could bring naval fire on any point at the request of the battalion commander.

Tank Battalion Training

Personnel of tank battalions assigned to the divisions received a three weeks' course in the adaptation of tanks for use in amphibious operations. By means of the Duplex Drive device a regular medium tank was converted into an amphibious tank and special instruction was necessary to train crews to operate this equipment. For the safety of the crews it was also necessary to equip each man with the Momson Lung and teach him its proper use.

The Duplex Drive device is a system of flotation for a medium tank which consists of a canvas screen fastened to the lower hull. When it is raised and held in position by mechanical means, the tank will float. Propulsion is obtained by propellers driven from standard truck differentials mounted on the sprocket hub. Power is transmitted to the marine screws in the rear through drive shafts mounted on the side of the tank. The Momson Lung, a device used by submarine crews to escape from sunken craft, was issued to each member of the tank crew so that escape would be possible in case of damage to the flotation apparatus.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

The regular tank training problems proved more difficult than the arrangements for experimentation and practice with new devices. Efforts to secure adequate ranges for the firing of tank weapons, for example, were unsuccessful. The Shermans went into combat without ever having fired a round of 105 mm direct fire at a target.

For training with the Momson Lung a large industrial reservoir at Battipaglia, Italy, approximately 100 yards long, 50 yards wide, and 15 feet deep, was prepared by the 40th Engineer Regiment. Tankmen practiced descending into deep water. At one end of the reservoir two compartments were constructed and a tank chassis lowered into one. The crews with their Momson Lung equipment then took their normal positions in the chassis with the turret closed. Then by means of a water gate the compartment was suddenly flooded from the main reservoir; and the tankmen quickly adjusted their equipment, opened the turret, and escaped to the surface. After this operation, water was pumped from the first compartment to the second, and the training process repeated.

On the Salerno training beaches the DD amphibious tank crews were first familiarized with the handling of DUKWs in the sea. They learned the effect of waves and the wake of other vessels on DUKWs, as well as problems of landing on beaches, and became accustomed to handling of vehicle-vessels in the water. They drove DD tanks from shore into the sea, maneuvered in the waves, and then landed. This was followed by practice in launching DD tanks from LSTs several hundred yards from shore and landing the tanks on beaches. Launching was carried out in different depths of water and at various distance from the shore. Care was taken to point out to crews the vulnerability of DD tanks to mines and underwater obstacles. They were taught not to approach beaches until paths had been cleared and marked through the underwater obstacles.

Engineer Beach Group Training

Combat engineer outfits went through particularly rigorous and thorough training because of their key role in dealing with enemy defenses. They were to clear the way for the infantry's advance and

establish initial supply dumps and depots. Attached to each division there was to be an engineer regiment reorganized into a Beach Group.

The vital problem of coordinating Army and Navy action in moving troops and supplies over the invasion beaches had resulted in appointment of a Beach Control Board early in March. This board, which included Captain English of the Navy and Colonel Edwin C. Eller, Seventh Army Engineer Section, had as its mission the recommendation of a standard operating procedure for unloading of supply ships. In middle March Colonel Eller, the Beach Group Commander, established a Beach Group Control Headquarters at Ecole Normale. The time had now come to transmit these plans to those who would carry them out in combat.

The 36th Engineer Beach Group with the 3rd Division was composed of the 36th Engineer Combat Regiment with attached 1st Naval Beach Battalion, and six companies and ten platoons from various chemical, ordnance, signal, military police, and other service troops. The 540th Engineer Beach Group with the 36th Division was composed of the Engineer regiment and the 48th Engineer Battalion, the 8th Naval Beach Battalion, two Quartermaster battalions, two port battalions, one Medical battalion, and 25 separate companies, platoons, and detachments of assorted service troops. The 40th Engineer Beach Group was with the 45th Division. This included the 4th Naval Beach Battalion, two Quartermaster battalions, two port battalions, one Medical battalion, and over 40 smaller units. The composition of these Beach Groups was such that each was a base section in miniature. The chief aim of training was still the practice of engineer assault duties, but the training period was so organized as to give special training to the Beach Group as units.

The mission of Engineer Beach Groups was to assist in the passage of underwater and beach obstacles and to debark over selected beaches troops, vehicles, and supplies of their respective divisions. They were subsequently to establish and maintain the necessary depots of supplies and equipment for the tactical forces. Training centered primarily on the first task, the passage of underwater and beach obstacles.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Of the Beach Group personnel only the Engineers, a small detail from the Chemical Warfare troops, and the Naval Beach Battalions were to participate in the initial landing. Their technical training program included extensive practice problems in demolition work; the scale was much more thorough than that given the infantry troops. The teams experimented with types of placed charges against all kinds of obstacles especially types known to be on the beaches of southern France. Underwater obstacles, beach obstacles, antitank walls and ditches were constructed and then destroyed by demolitions. Army and Navy personnel, all battle-tested men able to swim, were organized into special gapping teams.

As the selected beaches were known to be mined, emphasis was placed on mine warfare. Engineers were trained to operate the tank-'dozer and tank-scarifier, and to use rockets from launchers on M-4 tanks. Mine field detection and clearance were reviewed, especially the use of various types of mine detectors, primacord nets, and Bangalore torpedoes. Special teams were trained to lay Sommerfelt matting to expedite the movement of vehicles across sand, and others to operate tanks equipped with a boxgirder bridge for crossing antitank ditches.

One snag was the impracticability of the new type mine dectector. It was too heavy and far too sensitive. Engineers reported that the detector "picked up air pockets, roots, wood, stone, and small particles of iron and metal as well as box mines."

"The majority of engineer units of the new Seventh Army," General Davidson explained in his Engineer Historical Report, "were veterans of previous amphibious operations and had experienced many months in combat. Therefore, as the time was short, their training was limited to introduction of new methods and operation of new equipment. Instead of being trained themselves, engineer troops were used primarily to instruct the infantry, artillery, and like branches in demolitions, mine warfare, and the passage of obstacles . . . ."

All service troops received training in the use of their authorized weapons, in water-proofing and de-water-proofing vehicles, and in loading and unloading procedures. They attended lectures on

gas warfare, security, sanitation, orientation, map reading, and special subjects according to their respective duties. A physical conditioning program which included road marches, swimming, and calisthenics was followed by all troops.

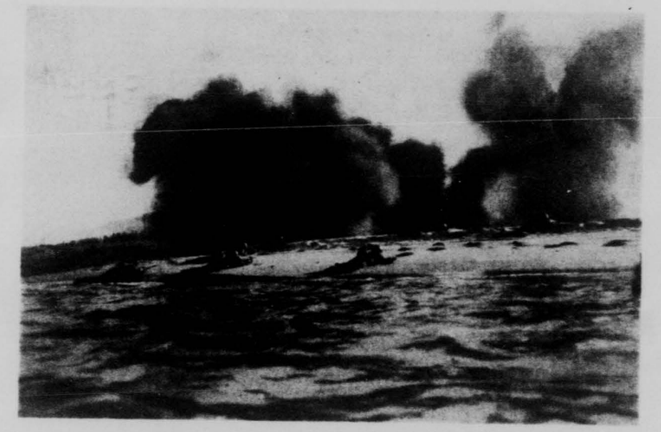
Medical units practiced driving ambulances over an obstacle course, carrying litters under simulated combat conditions, and training with DUKWs for evacuation of wounded from beach to ship. Military Police were instructed in the procedure of handling beach traffic and evacuation of prisoners of war.

Chemical Warfare units carried out a three-day training program in the operation and refilling of flame-throwers. They also assisted in the instruction of all troops of Seventh Army in defense against chemical warfare. Signal Corps troops practiced active message center operations under amphibious and beach conditions. Ordnance troops gave water-proofing instruction and studied the problem of setting up depots and repair and maintenance shops immediately following the landing. Quartermaster supply and transportation units practiced unloading operations and the establishment of initial supply dumps.

All this training was supervised and regulated by the Beach Group Commanders. Almost all the service troops had had campaign experience with the divisions to which they were attached. It was "organization" rather than "training" which was stressed.

Combined Landing Exercises

When the amphibious training schedule had been completed, two of the three divisions moved from the Salerno area to new bivouac areas north of Naples. Physical conditioning and regular combat training continued and equipment was brought up to standard. As much recreation as possible was allowed.



Under the direction of VI Corps, each division participated in a realistic "dry run" assault on a division scale, with naval and air support, simulating as closely as possible with conditions expected in southern France. On 31 July the 3rd Division rehearsal, known as

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

SHAMROCK, took place on the beach between Mondragone and Formia on the Bay of Gaeta. A week later the 36th Division landing exercise with full naval complement of ships was held in the same bay on the

A BANGALORE TORPEDO BLOWS OUT A BARBED WIRE BARRICADE
". . . full-scale practice assaults stressed combat realism . . ."

beaches near the mouth of the Garigliano River. This operation was known as *COWPUNCHER II*. Simultaneously the *THUNDERBIRD* operation by the 45th Division was taking place to the south on the Bay of Salerno. Since all these exercises were similar in nature, the 45th's will serve to illustrate their general scope.

The plan for *THUNDERBIRD* envisioned that at H-Hour on D-Day simultaneous daylight amphibious assaults were to be made employing three divisions abreast. After the beachhead was secure, an advance was to be made rapidly inland to contact an airborne division. The beachhead was to be expanded in order to seize high ground and airfield sites and to protect the right flank of the assault. Seizing the

"town" with a mobile striking force, troops would advance to the northwest. Throughout the operation contact was to be maintained with friendly troops to the west.

Everything was done to make the exercise simulate exact conditions of the coming invasion. On 5 August a field order arrived from the division headquarters for the exercise. Sealed overlays and maps were put aboard the ships. Embarkation took place in and near Naples from the same points which were later used in the departure for France.

The parallel was made as realistic as possible by the construction of the types of obstacles to be expected on the beaches of southern France. By the use of live ammunition, white phosphorous shells, mines with a reduced charge, naval gunfire, the laying of smoke screens and the firing of rockets at the beach from landing craft, battle conditions were made dramatic and instructive. Beach groups put in place floating piers, employed Bangalore torpedoes, laid landing mats and unloaded 105 mm howitzers from DUKWs. Demolition and mine clearance squads breached antitank obstacles and cleared mine fields. The smallest detail was handled with the same care that troops were expected to exercise on D-Day.

Airborne Training

The training program of the airborne troops, whose role Lieutenant General Ira C. Eaker, Commanding General of the Mediterranean Allied Air Force, called one of "great historical importance", had one aim: "to mechanize each man in his job so as to insure that he would carry out his mission under the most difficult circumstances." Because the 1st Airborne Task Force was made up of units which prior to 15 July 1944 had operated entirely as separate forces, it was necessary to organize these independent elements into a tactical organization under combat team commanders. Major General Robert T. Frederick, who formerly commanded the American-Canadian Special Service Force, was placed in command of the 1st Airborne Task Force and immediately

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

undertook the problems of organizing and training this newly activated unit.

A school for glider training was established near Rome. Between 20 July and 5 August nine ground units from artillery, chemical, infantry, engineer, signal, medical, and ordnance branches completed the course. The training team was provided by the 550th Glider Infantry Battalion; and instruction included the loading and lashing of equipment, two operational flights, and basic training in the technique of assembly after landing under simulated battle conditions. It was not an easy task to convert ground force troops into gliderborne units within the short time available. However, the 550th Glider Infantry Battalion instructional team had previously conducted glider training in the States; and their work was successfully accomplished.

The rehearsal training for the Airborne Task Force was divided into two phases, ground and air. The first consisted of a ground operation on terrain carefully selected to resemble the terrain which each combat team would occupy upon arrival in southern France. A schedule was prepared in keeping with the time schedule of the operation itself. All communication personnel of each combat team, with all their equipment, were engaged in this ground instruction. The air phase consisted of the actual loading and unloading of all personnel and equipment in accordance with the time schedule. Key personnel were flown in transports and in gliders over a route comparable to that of the operation itself. Rehearsals with air and naval support helped to coordinate the training of the Airborne Task Force with that of the other services.

The Special Service Force Points the Invasion

The spearhead of the invasion, the 1st Special Service Force, which was to assault the cliff-bound islands of Port Cros and Levant, had already had considerable combat experience. Originally organized from carefully selected Canadian and American personnel, it had been given varied forms of combat training, including parachute jumping, demolitions, mountain fighting, and amphibious tactics. This Force had

led the American drive into Kiska in the Aleutians, and had seen action in the Anzio Beachhead action, including the breakthrough and march on Rome.

Beginning about 5 August the Special Service Force was given intensive training under the direction of the Invasion Training Center at Santa Maria del Castelmonte, 75 miles south of Salerno. Naval Beach Marking parties and Naval Shore Fire Control parties were attached to the Force for training.

The Invasion Training Center program included organizing boat teams and infantry demolition squads, wire breaching by boat teams, the use of rockets, flame throwers, infantry weapons, the adjustment of individual equipment for debarkation, water-proofing signal equipment and weapons, and handling mines and booby traps. The Navy offered instruction in the care and use of rubber boats. Under joint Army-Navy sponsorship, classes were conducted in loading and unloading from naval vessels (APDs and LCIs), and in approaching precipitous shores with rubber boats. Practice in scaling cliffs was emphasized in day and night landing exercises against beachless shores. After each, critiques were held, and the Training Director made comments and suggestions in order to improve amphibious and other special techniques.

In addition to the Invasion Center program the Special Service Force carried out such activities as swimming instructions for non-swimmers, special methods for swimmers, route marches over hilly terrain, infiltration marches from beaches to inland objectives, compass problems, and a study of aerial photographs of the beaches.

The handling of rubber boats was emphasized in many rehearsals. These were first launched from APDs about 7,000 yards offshore where a flotilla was formed alongside the ship. Each rubber assault craft contained ten men, and as many as ten craft at a time were towed by LCVPIs to a line about 1,000 yards from shore. From that point the boats were paddled to shore and landings made. "Dry runs" against undefended shores were first attempted in daylight and then carried over into night problems. The main objective was the attainment of "complete surprise" and "rapid movement inland". It was assumed that the

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

enemy would be on the alert for the assault, but would expend his main effort on defending obvious beaches. Beach Special Service Regiment therefore prepared and executed a full scale combat problem covering all phases of training, including assault landing at night on rocky beaches, cliff scaling with full combat load, preparing for counterattack, and landing supplies.

On the night of 7-8 August, in the final practice assault called Operation *BRUNO*, the troops landed on the islands of Ponza and Zannona, off the Italian coast. Terrain features and conditions closely resembled those to be encountered in the coming operation. Sheer cliffs

3RD DIVISION TROOPS IN ITALY LOAD UP FOR A PRACTICE AMPHIBIOUS LANDING

seldom has an army moved from combat to training and then into combat again with so little loss of time . . .

extended down to the water's edge; strong winds were creating hazardous surf conditions. The cliffs were scaled, and the enemy was theoretically taken by surprise from the rear. The only difficulty of the

assault occurred when the engines of one of the landing craft broke down, and General Devers had to be "rescued" in a midnight mid-sea transfer by the USS *Greene*.

The French Commandos were given an intensive training program similar to that of the Special Service Force. In an area on the Italian coast near Agropoli they participated in small craft drills and practiced landing on beachless shores. The Navy furnished an APD and LSIs for rehearsals of ship-to-shore assault by teams using rubber boats. The emphasis during the training was on night operations, trying to preserve to the utmost the element of surprise. The final full-scale practice assault took place on the night of 7—8 August on the Italian coast near Mondragone.

Although the period of training for the Seventh Army's invasion of southern France was necessarily brief, it was realistic and effective. New techniques were introduced, and old ones reviewed. Seldom has an army moved from combat to training and then into combat again with so little loss of time. The Seventh Army returned from its final dress rehearsal on 8 August and began loading into transports. In less than a week's time the troops were putting into actual practice the lessons they had learned.

CHAPTER V

Moving to the Assault

AT the conclusion of the joint Army-Navy landing exercises, the three American assault divisions moved directly from their training areas to the Naples area for mounting. The French follow-up forces were to be loaded at Taranto, Corsica, and Oran, but only the Groupe de Commandos and a small French Naval Assault Group were to figure in the D-Day attack. The other French forces were follow-up troops and would not arrive at the target area until D plus one.

The Western Naval Task Force Commander conducted his final briefing for key commanders on 6 August. On 9 August General Lucian K. Truscott, the VI Corps Commander, briefed his staff, with Mr. James V. Forrestal, Secretary of the Navy, Admiral Hewitt, the Division Commanders, the Commanders of the Naval Task Forces, General Frederick of the Airborne Task Force, and General Saville of the XII Tactical Air Command present. On 11 August General Patch conducted his final briefing at Seventh Army Headquarters, Naples. Mr. Robert P. Patterson, Assistant Secretary of War, Lieutenant General Brehon Somervell, Army Service Forces Commander, Major General Thomas B. Larkin, and Brigadier General Morris W. Gilland from Services of Supply, North African Theater of Operations, General Saville, and Admiral Hewitt attended.

On the afternoon of 11 August the Chief of Staff and other Seventh Army Headquarters personnel went aboard the USS *Henrico* in the Bay of Naples. Here the Seventh Army set up its Command Post afloat. General Patch and his Assistant Chiefs of Staff, G-2 and G-3 and a few other key Staff Officers comprised the Advanced Seventh Army Headquarters aboard the USS *Catoctin*. So far as Seventh Army was

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

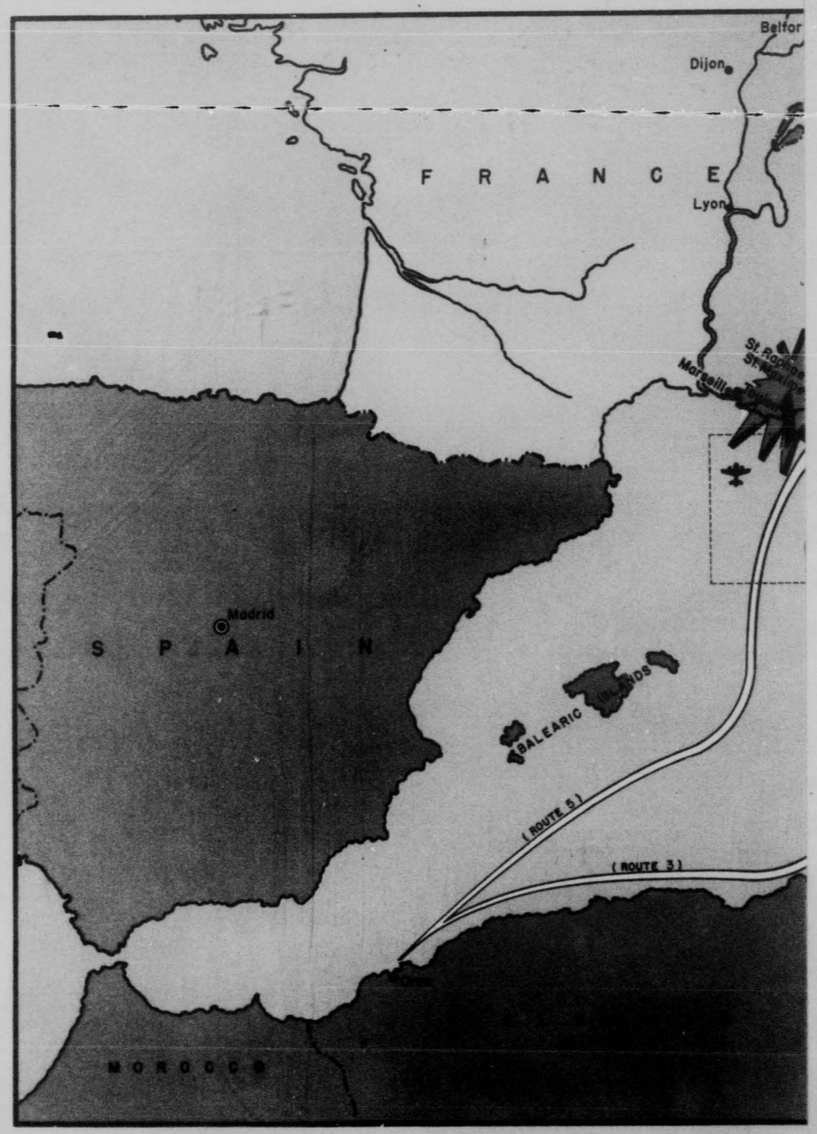
THIS PAGE IS UNCLASSIFIED

concerned, the die had been cast and there was little to do aboard ship but watch the tremendous amphibious force gather itself for its long-awaited strike into southern France.

In a message of commendation issued to the officers and enlisted men of Seventh Army Headquarters aboard ship, General Patch said:

> I desire at this time to express my appreciation for the painstaking zeal, initiative and high devotion to duty displayed by all officers and men of my staff in formulating the plan for the forthcoming operation . . .
>
> I recognize the patience and perserverance demonstrated by all members of the staff in following through with the planning despite obstacles and delays resulting from factors beyond their control, and upon which the progress of the planning was dependent. I deeply appreciate the constant effort, tireless application, and attention to duty displayed by all in completing the planning phase of the operation.

Numerous Parts Involved



The various elements of Seventh Army were waiting at ports of embarkation in Italy, Corsica, and North Africa. Some units had embarked as early as 15 July. In the Naples—Salerno area were the 3rd Infantry Division, commanded by Major General John W. O'Daniel, the 36th Infantry Division, commanded by Major General John E. Dahlquist, and the 45th Infantry Division, commanded by Major General William W. Eagles, together with the headquarters of VI Corps and Seventh Army. In ports on the "heel" of Italy was the French II Corps, under the command of General de Larminat, consisting of the 1st French Infantry Division, commanded by General Brosset, the 3rd Algerian Infantry Division commanded by General de Goislard de Montsabert, and attached troops. In Corsica were the 1st Special Service Force, commanded by Colonel Edwin A. Walker, and the French Groupe de Commandos, commanded by Lieutenant Colonel Bouvet, both of which had been moved combat loaded from the Naples area on 11 August. Near Oran, Algeria, were minor elements of the French II Corps, and General Sudre's Combat Command One of the French 1st

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Armored Division. Troopships and naval escort vessels waited in the harbors of Pozzuoli, Naples, Salerno, Taranto, Brindisi, Palermo, Malta, Oran, and Ajjaccio.

It was logical that the operation should be mounted from Allied-controlled ports nearest the selected assault area of southern France. The island of Corsica lies 100 miles southeast of the assault beaches, but its ports are insufficient to accommodate ships for a major naval operation. The greater portion of the forces forming the initial assault were marshalled near the excellent anchorages, beaches, and restored docks in the Naples area, including the harbor facilities of Cuma, Baia, Pozzuoli, Bagnoli, Nisida, Portici, Castellammare, and Salerno. This area lies some 430 miles southeast of the assault beaches. The approach corridor for the assault would be the stretch of water between the northwestern coast of Corsica and the beaches. For the subsequent build-up, all available Allied-held ports would be used.

Naval convoys which transported the forces were to follow the regularly prescribed routes or channels; these prearranged routes were to be swept of mines and efficient air protection given by regular and coordinated aerial patrols. Deviations for the purpose of deception were to be made from the formal convoy lanes, but in general there were ten arterial routes of communication between the mounting areas and the coast of southern France.

Convoy Routes

Of these ten routes, Route number one from the Naples area was the most important, since it was to be used by the main force of the assault. It proceeded from Naples in a northwesterly direction, passing through the Straits of Bonifacio, which separate the islands of Corsica and Sardinia, and thence followed the western coast of Corsica in a northerly direction until abreast of the middle of the island. Here (42° 04' Latitude, 08° 12' Longitude) the main route was joined by routes from the "heel" of Italy, Sicily, Sardinia, and North Africa. This point served as a naval assembly area, from which convoys were to proceed to the invasion beaches.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

The Aircraft Carrier Force, commanded by Rear Admiral T. H. Troubridge, RN, departed from Malta on 12 August and followed convoy route number two to the assembly area off Corsica. This force consisted of seven carriers of the Royal Navy, the *Khedive*, *Emperor*, *Searcher*, *Pursuer*, *Attacker*, *Stalker*, and *Hunter*, and two from the United States Navy, the *Tulagi* and the *Kassan Bay*. Aboard each ship were 24 fighter aircraft, including Seafires, Hellcats and Wildcats, some equipped to fire rockets. Four antiaircraft cruisers ("flak ships") and 14 destroyers escorted the carriers. The Aircraft Carrier Force, in conjunction with land-based fighters from Corsica, provided air cover for the assembling convoys and later for the landing. On D-Day 150 sorties were flown by carrier-based aircraft.

To accommodate the two pre-D-Day assault forces, a special naval task force of high-speed ships was organized. This was known as the Support (Sitka-Romeo) Force and was commanded by Rear Admiral L. A. Davidson, USN. The naval complement consisted of five transport (APDS) and three medium and two small infantry landing ships, making a total of ten, escorted by the French battleship *Lorraine*, one heavy cruiser, five light cruisers, three destroyers, 16 motor torpedo boats, and 15 small craft. The Sitka Force (First Special Service Force) included 2,057 troops, and the Romeo Force (French Commandos) was approximately 1,000 strong. The former had come from Santa Maria de Castelabate and the latter from Agropoli, both in Italy. On 11 August they both transferred to Propriano near Ajjaccio, Corsica. Here they remained for two days, cleaned equipment, and were briefed with the most recent intelligence concerning their objectives.

To transport the three assault divisions the Western Task Force originally allocated 60 six-davit LSTs, to be distributed on a basis of 20 to each division. The divisions planned to lift four assault battalions apiece. Subsequently, however, the number of six-davit LSTs was reduced to 50. This necessitated a major change in the plan for lifting the assault battalions, and by command decision the 50 LSTs were re-allocated as follows: 20 for the 3rd Infantry Division, 15 for the 45th Infantry Division, and 15 for the 36th Infantry Division.

The 3rd Infantry Division was the basic element of Alpha Force, which was carried and supported by Naval Task Force No. 84, under the command of Rear Admiral F. J. Lowry, USN. This force was mounted during the second week in August from the Pozzuoli-Nisida-Naples area and was allocated 122 troopships. Three battalions were loaded on the 20 six-davit LSTs, three battalions in combat loaders, and three battalions in LCIs. The division strength, including the 36th Engineer Beach Group and attached units, amounted to 28,756 men and 3,636 vehicles. In the same convoy were 5,114 men and 907 vehicles of Seventh Army and the Air Corps loaded in ten additional transports. The build-up of Air Corps equipment and personnel continued from Corsica for some time after D-Day by means of a special LST shuttle system.

The French forces scheduled to land in the Alpha area beginning on D plus one had already mounted farther south and were proceeding to the convoy assembly point off Corsica. From the "heel" of Italy the French II Corps, 1st French Infantry Division, and 3rd Algerian Infantry Division, with attached service units, a total of over 34,000 individuals and 4,951 vehicles, moved on 50 large transports. At the same time 11 motor transports with 6,852 additional troops and 1,258 vehicles of French II Corps were enroute from Oran. The Naval escort of the Alpha Force came from Malta and included the British battleship *Ramillies*, the heavy cruiser USS *Quincy*, five light cruisers, six destroyers, and 13 smaller craft, bringing the grand total of the Force to 207 vessels, carrying 74,500 soldiers and 10,752 vehicles.

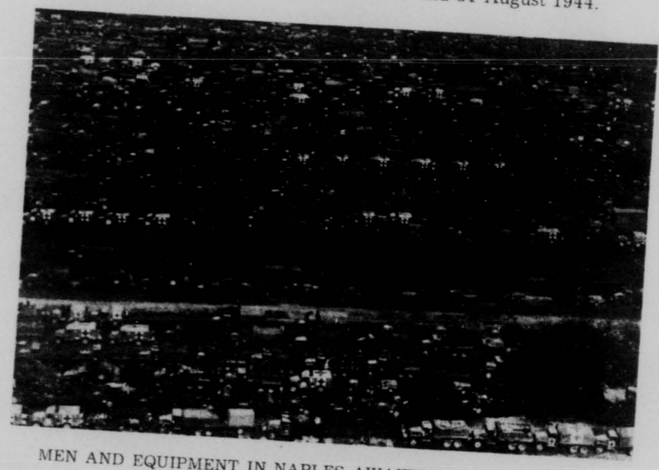
The Delta Attack Force, supported by Naval Task Force No. 85, commanded by Rear Admiral B. J. Rodgers, USN, was much smaller than the Alpha Force and was mounted simultaneously with Camel Force at the Pozzuoli-Nisida and main Naples staging areas. Army personnel included the 45th Infantry Division, the 40th Engineer Beach Group, and attached assault elements, totalling 36,654 men and 5,359 vehicles. Twenty-four large transports and 106 landing ships and craft were necessary to accommodate the force. Three of nine combat battalions of the 45th Division were loaded on the 15 six-davit LSTs, three on combat loaders, and three on LCIs. Two battleships, the USS *Texas*

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

and USS *Nevada*, three light cruisers, 11 destroyers, and some 43 small craft from the base at Taranto formed the Delta naval escort, bringing the convoy to a total of 189 vessels.



Naval Task Force No. 87, commanded by Rear Admiral Lewis, USN, transported the Camel Assault Force from Italy and Combat Command Sudre of the French 1st Armored Division from Africa. In the Naples area the 36th Division, the 540th Engineer Beach Group, and attached troops, 31,355 men and 4,313 vehicles, were loaded between 10 and 12 August on 20 transports and 91 landing ships and craft. The nine combat battalions of the 36th Division were loaded in the same manner as those of the 45th Division, but special arrangements had to be made for the loading of vehicles. This was necessary because an H-Hour assault over the heavily defended Camel Red Beach (264-A) presented too great a risk, and the first LST and LCI landings were to be made on the nearby Agay Beaches. Red Beach was to be attacked by ground forces first and by naval gunfire at H plus six hours, and the loading of vehicles was planned to fit this anticipated delay.

The Camel Force was joined by one combat command of the French 1st Armored Division, composed of over 5,000 men and 1,000 vehicles. The French were mounted in five motor transports, six LSTs, and one LCI at Oran and followed convoy route number three to join the Camel convoy off Corsica. Also from Oran came the United States battleship *Arkansas*, one heavy cruiser, the USS *Tuscaloosa*, five light cruisers, and 11 destroyers to give fire support to the force.

To supervise the embarkation of all follow-up troops not included in the D-Day assault, a Seventh Army Rear Echelon, commanded as aforesaid by Brigadier General Kelly, remained at Naples. General Kelly had been designated Near Shore Control Officer and was connected by direct radio channel with the Forward Echelon, Seventh Army, on the far shore. All changes in priorities in mounting troops and supplies that were made necessary by developments on the far shore were radioed to the near shore for action. Four liaison officers with the Near Shore Control were stationed, one with Mediterranean Base Section at Oran, two with Northern Base Section in Corsica, and one at the port of

Taranto, so as to control the shipment of troops and supplies from these points.

Near Shore Control officers also served to check on the operation of the base sections, to insure that Seventh Army units carried out the mounting plan fully and on schedule. The steady, uninterrupted flow of troops and supplies according to priority changes based on the tactical situation continued until all major units of Seventh Army had been dispatched and a base of supply created in France. Through this means more than 125,000 troops, 34,000 vehicles, and 165,000 tons of cargo reached southern France between 18 and 31 August 1944.

MEN AND EQUIPMENT IN NAPLES AWAITING LANDING CRAFT FOR THE INVASION

". . . the troop list totalled 155,419 personnel and 20,031 vehicles . . ."

Moving to Rendevous

The vessels of the Alpha, Delta, and Camel Attack Forces left the Naples area on 11, 12, and 13 August, the slower vessels sailing first.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

Seventy-two hours prior to embarkation, maps in sealed packages and the Seventh Army map identification code and key in a sealed envelope had been delivered to unit S-2s. These were to be opened four hours after sailing and all assault troops carefully briefed. First the unit officers were briefed and they in turn instructed the enlisted men under their commands. By the use of charts, pictures, blackboards, and sponge rubber models showing terrain, the exact mission of each assault team was explained in detail. Prior to debarkation all watches were synchronized with ship's time.

Shoulder patches and appropriate flag brassards, both American and French, were distributed. Soldiers sat about the deck sewing on their insignia and reading the "Pocket Guide To France". Rations for the first days were issued, with each man receiving one K ration, one D ration, a small bottle of Halazone tablets to purify water, one bottle

INVASION LOADING OF LSTs IN BAGNOLI HARBOR, ITALY

Said General Patch: 'We are embarking for a decisive campaign . . . The agonized people of Europe anxiously await our coming' . . ."

of salt tablets, and two packages of cigarettes. Units were issued two rations of either C, 10-in-1, or D, plus one of D on a basis of strength. The voyage was uneventful. There was no enemy opposition by submarine, surface craft, or aircraft. The convoys sailed northward along the western coast of Italy and passed through the Straits of Bonifacio. On the evening of 14 August a message from General Patch was read over the ships' loud speakers:

> Soldiers of the Seventh Army:
>
> We are embarking for a decisive campaign in Europe. Side by side, wearing the same uniform and using the same equipment, battle experienced French and American soldiers are fighting with a single purpose and common aim - - destruction of Naziism and the German Army. The agonized people of Europe anxiously await our coming. We cannot and will not fail. We will not stop until the last vestige of German tyranny has been completely crushed. No greater honor could come to us than this opportunity to fight to the bitter end in order to restore all that is good and decent and righteous in mankind. We are an inspired Army. God be with us.

At approximately 1900 hours, 14 August 1944 off the Western coast of Corsica the *DRAGOON* convoy met in rendezvous and turned toward its objective.

Softening the Target

The strategy of Operation *DRAGOON* included plans to soften the beach defenses by concentrated bombing and to isolate the assault area by special landings prior to H-Hour. To accomplish this isolation the specially-trained American Special Service Force, the French Commandos, and the French Naval Assault Party were to land at midnight 14-15 August on the flanks of the invasion beaches. The 1st Airborne Task Force was to be dropped before dawn 15 August in the rear of the target area, thereby preventing the enemy from reinforcing his coastal defenses. The Air Force was to step up its regular offensive operations against enemy lines of communication and military installations in southern France and Italy, turning attention to the invasion as D-Day and H-Hour approached. The fire support ships of the Navy

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

were to shell the beaches just prior to H-Hour. The Air Corps started the execution of the pre-invasion bombing during the first week in August.

MEN LOADING INTO GLIDERS FOR THE INVASION TAKE-OFF

". . . The 1st Airborne Task Force was to be dropped before dawn 15 August in the rear of the target area, preventing the enemy from reinforcing his coastal defenses . . ."

While the embarkation of the ground forces was in progress, the XII Tactical Air Command under General Saville was already softening the enemy for invasion. Fighter bombers from bases in Corsica and Sardinia were attacking coastal defense guns, beach defenses, lines of communication, air fields, and radar installations. Assigned air support included six groups of P-47s, three wings of R.A.F. Spitfires, one squadron of A-20s, one squadron of Beaufighters, two squadrons of tactical reconnaissance Spitfires, one squadron of P-51s, and one squadron of photographic reconnaissance aircraft.

Their offensive support of Operation *DRAGOON* was divided into four phases. Phase I, period 5 August to five days prior to D-Day;

Phase II, from D minus five to 0350 hours D-Day, known as Operation *NUTMEG;* Phase III, 0350 hours D-Day to H-Hour, known as Operation *YOKUM;* and Phase IV, the period after 0800 15 August, known as Operation *DUCROT*.

The first phase was a continuation of the regular air activities in the Mediterranean Theater, designed to assist in the future assault on southern France, but to appear to be supporting the offensive in northern Italy or in Normandy. Tactical surprise could not be jeopardized. Enemy air fields, submarine bases, and major communication lines were attacked in the Marseille-Toulouse area, the Genoa area, and in the Po Valley.

Operation *NUTMEG* opened on 10 August with attacks by P-47s on gun positions on Cape Esteral, Cape Benat, the Isle of Levant, and Carmarat. Radar installations from Marseille to Cannes were attacked with explosives dropped during the course of 410 sorties on the following day. As *NUTMEG* was essentially a cover plan, on 12 August the Strategic Air Force dispatched 139 B-17s and 94 B-24s against Sete, and a small force against gun positions at Marseille. Fighter bombers of the 87th Fighter Wing flew 384 sorties against communications, destroying bridges at Arles, Tarascon, and Avignon. Medium bombers again struck the invasion coast. On 13 August enemy airfields in the Rhone Valley and aircraft on the ground received special attention from over one hundred P-47s. As the convoys began to sail, the air assault increased accordingly. Gun positions, bridges, and communications were blasted by 626 heavy bombers escorted by 241 fighters. Four Wellington bombers scanned the convoy route for two U-boats reported at sea.

Restricted visibility interfered with the original schedule, but by 0350 on D-Day virtually the entire *NUTMEG* task had been accomplished. Effective sorties totalled 5,408, divided about evenly between the Strategic and Tactical Air Commands. Tonnage dropped totalled 6,400, of which the Strategic Force supplied 4,451. The effort cost 50 aircraft, of which 15 were heavies, four medium, two patrol bombers, and 29 fighters or fighter bombers.

During the 24 hours prior to D-Day the attention of the Air Force was directed more specifically to the invasion coast. Bombers

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

ranged inland to strike fuel dumps and motor transport, radar installations, coastal watching stations, and gun positions on the coast itself. Fighter planes flew over 200 sorties to cover the assembling invasion convoys off Corsica. During the whole *NUTMEG* phase the enemy offered merely token resistance, limiting his air activities to fast reconnaissance trips to watch convoy movements. The Germans were apparently aware of the impending assault, but they were confused as to the exact area of assault.

To add to the enemy's confusion, the cover operation *FERDINAND* was carried out during the night of 14-15 August. Two naval diversion "forces", including heavy ships, sailed at 1800, 14 August to feign assault west of the selected beaches in the Ciotat area, which is between Marseille and Toulon, and to the east between Cannes and Nice. To simulate an airborne assault, five aircraft left Corsica after midnight (0115, 15 August), each carrying 5,780 pounds of parachute dummies, rifle simulators, and window (strips of paper covered with metallic paint to confuse enemy radar). This material was dropped from a height of 600 feet in a zone near Ciotat. Immediately the enemy was alerted, as the pilots reported many flashes, colored lights, and small explosions. The success of the operation was later established from prisoners taken on D-Day.

Experience in previous invasions had taught the value of concentrated air attacks on targets in the assault area. In keeping with this idea an all-out effort was made to soften the strong points of the invasion coast immediately before H-Hour. At first light on D-Day patrols of P-38s, Spitfires, Hellcats, and Wildcats from the Carrier Force, all carrying bombs, struck at the assault area. The Air Plan called for administering 1,000 pounds of explosives for each ten yards of invasion beach at H minus one hour. For this task 40 heavy bombers and 120 medium bombers were assigned to each 1,000 yards of beach. On schedule at 0650 hours, 83 B-17s, and 138 B-26s struck Alpha beaches with excellent results. Because the beach area was overcast, the attack on Delta and Camel had to be somewhat restricted for the safety of our surface forces. The strongly fortified northern portion of Camel Red Beach was bombed between 0650 and 0720 hours by 162 B-25s with

good coverage. Meanwhile fighter bombers and heavy guns of the Navy were pounding coastal batteries in the same area. Bomb loads dropped on the beaches consisted largely of small fragmentation and demolition bombs, instantaneously fused; but for gun positions large demolition bombs with short delay fusing were used. All told, in operation *YOKUM* the Mediterranean Allied Air Force dispatched 959 sorties, of which 610 were effective, and dropped 774 tons of explosive.

Operation *DUCROT* commenced at H-Hour. During the course of D-Day, 3,936 sorties were flown, the mightiest air effort ever put out in a single day in the Mediterranean. The Air Corps provided continuous cover for the invasion area and struck at the enemy's lines of communication, troop concentrations, and movements in the rear. Throughout the day fighter planes from Corsica and from carriers flew more than 500 sorties over the beach and adjacent areas.

The Naval Fire Support ships commenced long-range bombardment of prearranged targets at 0530. Until 0800 this fire was almost continuous, lifting only when bombers were over the targets. Following behind the minesweepers, ships approached the shore and laid down a "drenching" fire on beach fortifications. In all, naval guns threw over 15,900 projectiles into the beach defenses. White phosphorous shells were included and were reported very effective. The aerial bombing had ceased at 0730 to allow the smoke over the area to clear and to enable the naval gunners to fire without interference on observed targets and positions revealed by gun flashes. The shelling continued until 0750; and then it shifted to the flanks, for the hour of the major assault was at hand. Meanwhile the pre-H-Hour assault forces had landed and begun the isolation of enemy forces in the strategic area.

Final Isolation of Target Area

Plans to isolate the invasion area by commando assaults on the flanks went into operation on the night of 14-15 August. Ships of the Support Force (Naval Task Force No. 86) moved from Propriano, Corsica, at 1130, 14 August. Shortly after darkness the sharp outlines of the cliffs of Levant and Port Cros appeared in the offing.

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

The troops of the Special Service Force received last minute instructions and briefing as the convoy moved into position. The islands were to be assaulted by scaling the cliffs on the seaward side.

THE BEACHLESS SHORES OF THE ISLE OF PORT CROS

". . . Commando assaults went into operation on the night of 14—15 August. Shortly after darkness the sharp outlines of the cliffs of Levant and Port Cros appeared . . . Surprise was complete . . ."

These landing sites had been selected by Colonel Walker, Commander of the Special Service Force, after study of aerial photographs and later reconnaissance from a British submarine. French officers, and others familiar with the terrain, advised that a landing over the south coast of the islands was impracticable or impossible. This situation was just what was wanted, since the Germans would probably believe likewise and make little or no effort to defend the cliffs. The troops had been especially trained for the task. After they had scaled the cliffs, they were to destroy all enemy defenses, particularly coastal guns that might threaten the invasion fleet. When relieved by French troops on the

evening of D-Day, the Special Service Force was to withdraw with its prisoners to the mainland.

Weather conditions were ideal, the sea calm, the night dark enough to cover the operation, but with sufficient star illumination to enable landing craft to identify prominent landmarks and landing areas. The transports stopped approximately 8,000 yards offshore, and debarkation into 10-man rubber assault boats began at 2300 hours. These boats were secured three to a single towline, making a total of nine towed by a single LCI to within 1,000 yards off shore. As the assault boats were being paddled toward the beach, scouts in kayaks and electric surfboats preceded them to mark the landing spots with small lights. The 1st Regiment, approximately 650 men, landed on Port Cros, and the 2nd and 3rd Regiments, about 1,300 strong, debarked at midnight on the island of Levant. Both groups included attached Naval Shore Fire Control parties. The landings were unopposed and all groups reached assembly areas without interference.

Surprise was complete. Although the enemy had been alerted for an assault on 15 August, reports from prisoners revealed that the Germans did not expect an attack up the cliffs on the seaward side of the islands. Resistance on Levant was scattered and moderate, and the enemy shortly withdrew to the port of Levant, where he put up a stiffer fight. By dawn a beach was cleared, supplies landed, and the wounded evacuated. The coastal defense battery at the eastern end of the island was found to be a cleverly camouflaged dummy. During D-Day, mopping up continued on Levant, but because of radio failure regular reports could not be sent the Force Command Post aboard the USS *Catoctin*. During the afternoon General Patch sent his aide-de-camp to Levant to investigate and report. Mr. Forrestal, Secretary of the Navy, accompanied him. They found only snipers and small pockets of resistance still active. By 2234 hours on D-Day all resistance on Levant ceased.

The 1st Special Service Regiment on Port Cros met little initial opposition, but the German garrison withdrew to an old fort on the west end of the island and there resisted tenaciously. This fight continued into the next day, and during the hours of darkness an enemy battery at Cap Benat shelled Port Cros. This delayed the off-loading and

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

installation of radar equipment. By radio the Shore Fire Control Party directed naval fire on the fort from HMS *Ramillies*. On the morning of 17 August an attack was launched, and shortly afterward two German officers and 46 enlisted men surrendered. Their mission accomplished and the islands garrisoned by French army and navy personnel from Corsica, the Special Service troops were evacuated in LSIs to the mainland, where they assembled in the vicinity of Sylvabelle on Cavalaire Bay.

To protect and secure the left land flank of the invasion coast, Romeo Force was landed by the Naval Support Force at Cape Negre prior to H-Hour. This force of French Commandos, under Lieutenant Colonel Bouvet, landed from three LCIs shortly after midnight 14-15 August west of the Alpha beaches. Their mission was to destroy all enemy coastal defenses on the cape, to establish a road block on the coastal highway, and to seize and hold the high ground two miles to the north. Two advance light detachments were sent in small boats as an initial assault force.

The first detachment of 70 men beached from rubber assault boats at the eastern base of Cape Negre, scaled the steep banks, and took the enemy by surprise. They destroyed the gun emplacements and established a tank block in a pass on the coastal highway. This operation was successfully and quickly accomplished. The second detachment was to land in two sections on either side of Le Rayol beach, two miles east of the Cape, to surprise and knock out the pillboxes believed to exist in that area. Afterwards they were to prepare the beach for the landing of the main force from LCIs. Because of the difficulty of locating Le Rayol beach in darkness, a small reconnaissance party preceded the detachment and marked the beach with a guide light. In spite of this precaution, one section landed near Cape Negre, where it was fired upon by the enemy and suffered some casualties. The main body followed at about 0100 hours and, failing to observe the guide lights, also landed in the wrong area, this time at Le Canadel between Le Rayol and the Cape. Since time was of the utmost importance, the LCIs proceeded to land on the beach at Le Canadel. The enemy was

found to be confused and disorganized, and the landing was accomplished without a single shot being fired.

Taking advantage of the enemy's disorder, the force hastened to accomplish its mission with little interference. By morning the beaches were cleared and a junction effected to the west with the detachment holding the tank block at Cape Negre pass. During the morning the enemy reorganized and launched several violent counterattacks, but these were repulsed. The Commandos continued to advance inland, clearing the towns of Le Rayol and La Mole of Germans and mopping up all pockets of resistance in the area.

At approximately 1300 on 15 August a combat patrol from the U.S. Third Division contacted the French Commandos. This brought the force under the command of VI Corps; at 2000 hours the Commandos received orders to resume their advance westward to Le Lavandou.

To sever German communications to the east between Cannes and the right flank of the assault area, a road block was to be established on the coastal highway prior to H-Hour. A demolition party of 67 French Marines was organized, known as the *ROSIE* Force or the French Naval Assault Group. The force was to land in the vicinity of Pointe des Trayas on the night of D minus one and to block the roads from Cannes to St. Raphael and Frejus. The block was to be constructed by the demolition of trees and telegraph poles and by laying mines in critical areas. During the night of 14-15 August the party was landed from four torpedo boats in seven rubber boats on the beach south of Theoule-sur-Mer. In the darkness the Marines ran into barbed wire defenses and anti-personnel mines. The explosions and confusion alerted the enemy, who immediately opened fire with deadly effect. The party dropped their demolition equipment and attempted to withdraw. However, the operation failed completely and on the afternoon of D plus one the survivors made contact with the 36th Division. Twenty-two wounded were evacuated by the 56th Medical Battalion, and many of the rest had either been killed or captured.

To isolate the assault area completely it was necessary to cut the coastal highway on each end of the projected beachhead and to block

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

enemy movement from the rear. The coastal highway was bisected at Frejus by a road leading from the interior down a defile to the coast. The 1st Airborne Task Force, known as *RUGBY* Force, was to land at various hours on D-Day beginning at 0430 near Le Muy and Le Luc to establish the necessary road blocks, to prevent enemy movement toward the beaches, and to help reduce the defenses in the Frejus area.

The Airborne Task Force was created and trained especially for the requirements of the assault on southern France. It was activated on 15 July under command of General Frederick. The Airborne Force included the 2nd Independent Parachute Brigade (British), the 517th Parachute Infantry Regiment, the 509th Parachute Infantry Battalion, the 1st Battalion, 551st Parachute Infantry Regiment, the 460th Parachute Field Artillery Battalion, the 463rd Parachute Field Artillery Battalion, the 550th Glider Infantry Battalion, the 602nd

PARATROOPERS AND A SUPPLY DROP ON LATE D DAY

". . . No air opposition was encountered, and the paratroopers had drifted down safely through the fog. On the ground the enemy was contacted immediately, but resistance was light . . ."

Glider Pack Howitzer Battalion, and glider-borne supporting troops. The supporting troops included two chemical mortar companies, an infantry antitank company, two engineer companies, a signal company, a medical collecting company, and an ordnance detachment. The total strength of the force was 9,732 men to be transported in 535 C-47s and C-53s and 465 gliders.

The provisional Troop Carrier Air Division was detailed to transport the Force. To avoid convoy routes to the target area, aerial routes were set up east of the assault corridor and marked by beacon ships. Three drop zones, O, A, and C, were chosen along the Nartuby and Argens Rivers near the towns of La Motte, Trans-en-Provence, and Le Muy. Zone A and Zone O were either flat, cultivated fields or gently rolling ground suitable for both parachute and glider operations. Zone C was a broken, rocky area, much less desirable. On D-Day there was

AMERICAN TROOPS AT A FRENCH CROSSROADS 15 AUGUST 1944

". . . Defensive lines were established at all zones, and all enemy forces were driven out, except in the village of Le Muy . . ."

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

a dense fog over these zones, but most of the parachute elements dropped on or near their objectives. The 509th Battalion Combat Team dropped in Zone C about 0430 hours; the 517th Regimental Combat Team in Zone A at 0435 hours; and the 2nd Independent Parachute Brigade in Zone O about 0510.

No air opposition was encountered, and the paratroopers drifted down safely through the fog. On the ground the enemy was contacted immediately; but resistance was light, primarily small arms fire. Defensive lines were established at all zones, and all enemy forces driven out, except in the village of Le Muy. Preparations were made for the arrival of the gliderborne elements.

The first glider serial landed in Zone O about 0930. During the day other serials arrived, and by late afternoon the whole *RUGBY* Force had landed. Contact with all elements within the Force was

AIRBORNE TROOPS LEAVING THEIR GLIDERS

". . . the first glider serial landed about 0930 . . . By late afternoon the whole Rugby Force had landed . . ."

established and the command post set up by 1800 hours. By the end of D-Day the villages of La Mitan, La Motte, Castron, and Les Serres had been occupied and 103 prisoners taken. A protective screen had been established over the road net connecting the invasion coast with the interior. During the day the enemy counterattacked in the vicinity of Les Arcs but was repulsed by the 517th Regimental Combat Team.

The 2nd Independent Parachute Brigade had successfully blocked the highway at Le Muy but had been unable to take the town. The capture of Le Muy was then assigned to the 550th Glider Infantry Battalion. During the early morning of 16 August an unsuccessful attack was launched against Le Muy. The airborne troops continued to attack and overcame determined resistance at about 1500 hours. During D plus one other elements of the force fanned out and consolidated their positions. Late in the afternoon of the same day contact

THE LIBERATION OF THE VILLAGE OF LA MOTTE

". . . at the close of D plus 1 the 1st Airborne Task Force had destroyed all enemy resistance in its assigned zone . . ."

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

was made with reconnaissance elements of the 45th Division. At the close of D plus one the 1st Airborne Task Force had destroyed all enemy resistance in its assigned zone of responsibility and had taken 493 prisoners of war.

An unexpected achievement was the assistance given by airborne troops in the capture of St. Tropez in the 3rd Division area. About 0430 on D-Day one serial of 29 planes became confused by ground fog and dropped its load at the wrong point. Thus two full batteries and parts of two others of the 463rd Parachute Field Artillery Battalion, including the Battalion Commander, landed about three miles south of St. Tropez near sizeable enemy coastal installations and in the target area of the Allied bombers and naval guns. These paratroopers weathered the bombardment by their own forces and, although considerably shaken up, suffered no casualties. They managed to assemble, put five guns in operation, and capture intact one enemy antiaircraft battery, two coastal batteries, and a garrison of 240 Germans. Part of one battery, along with elements of the 509th Parachute Infantry Battalion, entered St. Tropez and occupied the town. When the forward troops of the 15th Infantry Regiment, 3rd Division, reached St. Tropez they found the paratroopers attacking the last German defenders in the town strongpoint known as the Citadel.

In the parachute and glider operations no aircraft or gliders were lost from enemy action, but many gliders were wrecked in landing, and there were at least 148 glider casualties. During the operation 987 sorties were flown, 407 gliders towed, and 9,000 airborne personnel carried, along with 221 jeeps, 213 artillery pieces, 4,938 pounds of bombs, 759,112 rounds of ammunition, 56,896 pounds of rations, and 744,831 pounds of miscellaneous materiel. On D-Day, D plus one, and D plus two over 287 tons of supplies were dropped by parachute; but because of wind conditions and lack of sufficient time to search the area thoroughly, only 40 percent was found.

The mission of the airborne operation was successfully accomplished, and prior to H-Hour the rear of the assault beaches was secured. On 16 August Major General John K. Cannon, Commanding General

of Mediterranean Allied Tactical Air Force, evaluated the operation as follows:

> Your troop carrier people put up a grand show yesterday. Your troop carrier units were equally responsible together with other organizations of the Tactical Air Force in making the air part of this operation so successful.

D DAY ON A ROAD IN SOUTHERN FRANCE

". . . While the transports and landing craft were approaching the beaches, the enemy in the assault area was cut off from his reinforcements . . . the mission of the airborne operation was successfully accomplished . . ."

With the exception of the operation of the French Marines at Theoule-sur-Mer all pre-H-Hour activities were successful. While the transports and landing craft were approaching the beaches, the enemy in the assault area was cut off from his reinforcements, and his defenses were pounded and seriously damaged. There was a feeling among enemy officers that they were deliberately left to their fate.

CHAPTER VI

The VI Corps Assault

The VI Corps convoys arrived in the assault area on 15 August 1944 according to plan. To organize and accommodate such a large assembly

GENERAL VIEW OF ST. TROPEZ HARBOR

". . . the VI Corps convoys arrived in the assault area on 15 August 1944 according to plan . . ."

of ships, the sea off the assault area was divided into two zones, one for fire support ships and the other for naval transports. Following behind the minesweepers, the fire support ships moved to within two miles of

THIS PAGE IS DECLASSIFIED IAW EO 13526

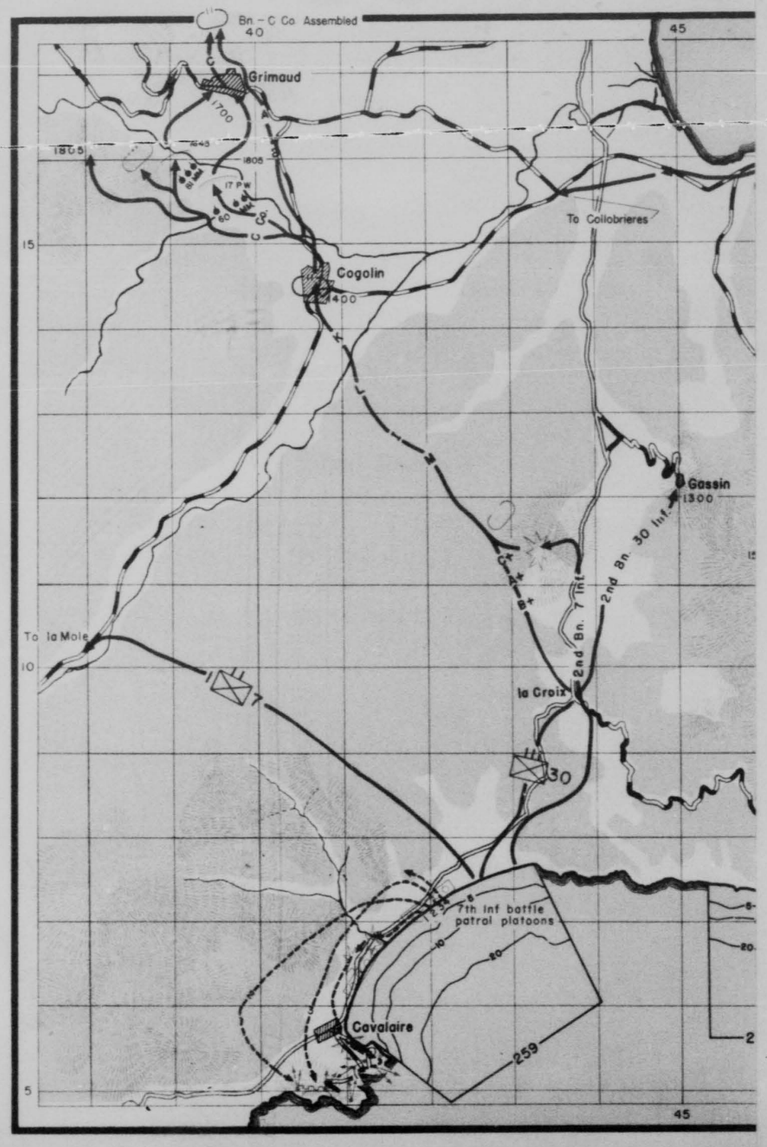
THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

the shore and opened fire on the beach defenses in the 45 mile area from Cape Negre on the west to the Gulf of Napoule on the east. The ships continued to fire on the beach defenses as they moved in. Behind this shield of naval armor and protecting gunfire, the transports assembled and began debarking their troops into hundreds of small landing craft. The awaiting troops watched the naval guns shell the beaches and saw the bombers drop their loads without encountering any enemy air opposition. Landing craft then made their way toward the smoking beaches in prescribed lanes between battleships, cruisers, and destroyers. As the assault craft approached shore, naval fire shifted to the flanks of the beaches.

The VI Corps Mission

The United States VI Corps, commanded by Major General Truscott, had been assigned the mission of assaulting simultaneously the beaches from Cape Cavalaire to Agay. The Corps was to establish a beachhead, and to advance rapidly inland to contact other friendly forces and secure airfield sites. The tactical plan called for employing three divisions abreast to destroy enemy beach defenses and to advance rapidly inland in order to extend the beachhead to the "Blue Line". Contact was to be made with the Airborne Task Force in the interior and other forces on either flank. The 3rd Infantry Division (Alpha Force) was assigned to the left flank, from Cape Cavalaire to the Cape of St. Tropez, including the town of St. Tropez. The 45th Division (Delta Force) was to assault the center of the invasion area, from the Cape of St. Tropez eastward to Point Alexandre, including the town of Ste. Maxime. The 36th Infantry Division (Camel Force) was to land and advance on the right flank, from Point Alexandre to the Agay Region. In the Camel area was the important Camel Red Beach, near the town of St. Raphael, and nearby was the road junction and airport at Frejus. The "Blue Line" was a tactical boundary drawn as an arc from Cape Leoube, approximately ten miles west of Cape Negre, the western flank of the assault area, cutting through Collobrieres, Le Cannet des Maures, Trans-en-Provence, and Bagnols-en-Foret to the sea at Theoule-sur-Mer, on the extreme eastern flank of the VI Corps area. This line delimited a beach-



THIS PAGE IS UNCLASSIFIED

head approximately 45 miles long, 20 miles deep, well established on high ground and including suitable terrain for air strips. The divisions were to advance beyond the "Blue Line" on Corps order.

Alpha Force

MAJ. GEN. JOHN. W. O'DANIEL
"... to capture St. Tropez ..."

On the left flank the 3rd Infantry Division, under the command of Major General O'Daniel, was to assault Alpha Red Beach (Beach 259, on the Bay of Cavalaire) and Alpha Yellow Beach (Beach 261, on the Bay of Pampelonne), in order to overcome enemy resistance and to capture the town of St. Tropez. After the St. Tropez peninsula had been cleared, the 3rd Division was to assist the 45th Division in clearing Beach 262, then advance rapidly west and southwest along the coast to contact the French Groupe de Commandos (Romeo Force), and to reach the "Blue Line" on the extreme western flank.

From 0710 to 0745 hours on D-Day, while the bombardment was still in progress, shallow minesweepers cleared boat lanes from 1,500 yards to within 100 yards of the beaches. To clear the last 100 yards of underwater obstacles, 18 drone boats were sent forward and all but three detonated properly. One got out of control and headed back toward the fleet. It exploded soon afterwards and damaged a naval vessel. From 0750 to 0758 hours naval craft poured rockets and inshore fire into the beaches. A dense, even pattern of fire on shore was reported by the first assault wave as troops came in under cover of the barrage.

At 0800 hours the 7th Infantry Combat Team struck Alpha Red Beach and the 15th Infantry Combat Team landed on Alpha Yellow Beach. Included with each regimental combat team was a smoke detail from the 3rd Chemical Battalion, four amphibious tanks from the 756th Tank Battalion, four tank destroyers from the 601st Tank

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Destroyer Battalion, Naval Shore Fire Control Parties, and a section of the 36th Combat Engineers. Among the first to land was a specially-formed Battle Patrol of 154 men to be employed on special missions.

The 7th Infantry landed with the 3rd Battalion on the left, the 2nd Battalion on the right, and the 1st Battalion in reserve. Offshore this force had encountered rows of concrete tetrahedrons with encased tellermines. Several small landing craft were blown up, and 60 casualties resulted. The demolition crews began immediately to clear the way for other landing craft. About 2,000 yards from the beaches, amphibious tanks were launched from LCTs. Of the four at Alpha Red Beach three got ashore and supported the infantry, but the fourth was struck by a naval rocket falling short, and the tank commander was killed. Subsequently the tank was sunk near the shore by an underwater mine.

As the infantry moved over the beach, it encountered no enemy fire; but wooden box mines and wire slowed the advance. At 0825 hours the enemy came out of bomb shelters and opened fire with small arms and mortars on the right flank. However, amphibious tanks, tank destroyers, and howitzers that had landed from DUKWs were in position to meet this fire; and the 7th Infantry continued to advance inland against scattered and light opposition. The first prisoners seemed dazed and well shaken up by the preliminary bombardment.

Battle patrols had been sent out on the flanks as the remainder of the regiment moved over the beach. While the infantry silenced enemy small arms fire, the engineers were clearing lanes for vehicles through the mine fields and wire. This action progressed rapidly; at 0850 hours the violet smoke signal was given, signifying that enemy beach defenses were neutralized and that the division reserve, the 30th Regimental Combat Team, could land. Within ten minutes the 30th Infantry was landing and moving forward through the right flank of the 7th Regimental Combat Team.

Eight successive waves had now landed on schedule at Alpha Red Beach, and the beachhead was being steadily enlarged. Supported by tanks and tank destroyers, the two regimental combat teams moved

rapidly inland on both flanks. The 7th Infantry turned westward; its 3rd Battalion advanced along the coastal road and cleared the town of Cavalaire-sur-Mer. By 1330 hours 3rd Battalion troops had reached a road block in the vicinity of Cape Negre held by the French Commandos. By this time the 2nd Battalion, on the right, had advanced through the town of La Croix to its first objective, the high ground along the road two miles north of the town. When relieved by the 30th Regimental Combat Team at 1430 hours, the 2nd Battalion turned and advanced southwest toward La Mole and Highway 98, following the 1st Battalion.

The 1st Battalion had been released from reserve on the beach about noon; it advanced inland about four miles to reach Highway 98 and moved west along the highway to La Mole, passing through the town about dark. At dawn on 16 August the battalion encountered an enemy outpost. Company A began firing on hostile machine gun positions, while C Company turned into the woods south of the highway and opened up against the enemy with mortars. Resistance was quickly overcome, and the battalion proceeded to a road junction about 1,000 yards away, where the enemy was again contacted. Tanks and tank destroyers were sent forward in an effort to draw fire and thus discover the enemy positions. The Germans were apparently well dug-in on the high ground beyond the road junction. The 1st Battalion fought all day on 16 August with all its companies committed. Supporting weapons, including artillery, had to be employed before enemy resistance was broken early the following morning by the coordinated efforts of the 1st and 2nd Battalions.

After passing the 1st Battalion and the enemy road block, leading elements of the 2nd Battalion, riding on tanks and tank destroyers, were met near St. Honore by members of the French Forces of the Interior who stated that a battalion of the enemy was in position three-quarters of a mile east of the village. The infantry dismounted; tanks and tank destroyers were ordered to deploy and lead the advance toward the strongpoint. About 1600 hours on 17 August contact was made and an enemy antitank gun knocked out. One platoon of E Company aided by several members of the French Forces of the Interior,

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

then advanced on the gun emplacement and captured 25 prisoners.

Meanwhile the other platoons of E Company deployed and moved up to the high ground south and east of the village. Here they encountered about 75 well-entrenched enemy. After a quick battalion reconnaissance, G Company was ordered to move around the left flank and attack enemy positions from the south. Tanks and tank destroyers fired on the hill-mass preparatory to the attack. This, coupled with E Company's threat to his rear, caused the enemy to start abandoning his prepared positions. The attack was pressed by both companies and the village occupied and the road cleared.

By dark on the evening of D-Day the 7th Regimental Combat Team held a line from the coast west of Cape Negre six miles inland to the La Mole area. Little resistance was encountered during the morning, but at 2400 hours the advance along the coastal road was brought to a standstill by an enemy strongpoint two miles west of Cape Negre. Here the 3rd Battalion encountered a road block of pillboxes protected by mines and wire, covered by three antitank guns, six or eight machine guns, and riflemen. Although tanks and tank destroyers were brought up to fire on the block and two companies succeeded in outflanking it on the north and attacking it from the rear, the enemy continued to hold.

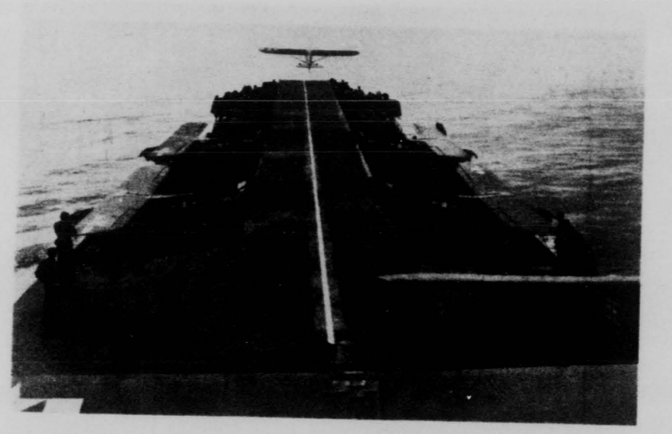
The attacking forces were also under fire during the night from enemy coastal guns further west in the area of La Fossette and Le Lavandou. To silence these batteries, the French Commandos, now under 3rd Division control, were sent around the roadblock to clear the Cape Benat peninsula of enemy forces. The following day the Commandos captured the batteries after a stiff fight, and the Americans were able to reduce the strongpoint at Point de la Et. During this action K and L Companies bore the brunt of the fighting. K Company made a wide flanking movement and took the enemy positions from the rear. Both companies used hand grenades and rifle fire to dislodge the enemy from pillboxes and dug-in positions.

The 3rd Battalion then continued west along the coastal road against only slight opposition, by-passing the 2nd Battalion as

it moved through St. Honore and north of La Londe les Maures. The French Commandos continued to mop up isolated enemy groups on the Cape Benat peninsula and then occupied Chateau de Leoube on the evening of D plus two.

A TANK TURRET SET IN CONCRETE AND USED AS A PILLBOX
". . . Both companies used hand grenades and rifle fire to dislodge the enemy from pillboxes and dug-in positions . . ."

On the right flank of the 3rd Infantry Division the 15th Regimental Combat Team landed at H-Hour over Alpha Yellow Beach and reduced all beach defenses within 40 minutes. The 2nd Battalion, 36th Engineers, immediately started clearing the beach of mines and laying beach pontoons for LST landings, since the gradient was too shallow for ships to come up to the beach. Of the four amphibious tanks supporting the assault, three landed safely and one was swamped by landing craft. Later another was disabled on the beach by a broken track. The infantry advanced inland against light small arms fire. The 1st Battalion cleaned out an enemy strongpoint on the northern portion



THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

of the beach and attacked inland some 5,000 yards to seize and occupy the high ground northeast of the town of Ramatuelle. The 2nd and 3rd Battalions moved to the north and northeast and quickly seized the high ground overlooking St. Tropez. The 2nd Battalion continued

A 3RD DIVISION BABY AIRCRAFT CARRIER IMPROVISED FROM LST-906
". . . a cub observation plane reported no enemy resistance or craft in the harbor of St. Tropez . . ."

to advance to the north and destroyed an enemy strongpoint on the western edge of the town. The 3rd Battalion moved up from the east.

Previously, at 0830 hours, a cub observation plane had reported no enemy resistance or craft in the harbor of St. Tropez. Later, word was sent by the French Forces of the Interior that the town was virtually clear and the populace would be glad to receive the Americans. At 1500 hours the 3rd Battalion, having reached the outskirts of St. Tropez, found American paratroopers and French Forces of the Interior assaulting the last enemy pocket of resistance in the Citadel. K Company joined in the attack. At 1830 hours this strongpoint fell and shortly afterwards

patrols of the 15th Infantry cleared the St. Tropez peninsula of enemy troops. After nightfall the regiment assembled west of St. Tropez and marched along roads already cleared of the enemy to Collobrieres on the "Blue Line".

While the 7th Infantry was moving west from Alpha Red Beach and the 15th Infantry was clearing the St. Tropez peninsula, the 30th Infantry, after landing at H plus one and passing through the 7th, swept inland toward Cogolin and Grimaud. By forced marches and riding infantry on tanks and tank destroyers, the 30th Regimental Combat Team moved rapidly forward to occupy these towns. At 2100 hours on D-Day its patrols contacted the 157th Infantry of the 45th Division between Grimaud and Les Cadelons. The right flank of the Alpha area was now considered secure and the entire regiment was only temporarily interrupted in its advance by sniper fire and token enemy resistance. On 16 August the towns of La Garde Freinet and Les Mayons were taken, and a line was established between Gonfaron and Collobrieres on the tactical "Blue Line".

By 1200 on D-Day the assault units of the 3rd Infantry Division had reached their initial beachhead line and were advancing toward primary objectives on the "Blue Line". Meanwhile, unloading over the beaches was proceeding at a fairly satisfactory rate, although it was hampered by off-shore bars on Alpha Yellow Beach and beach mines and obstacles on Alpha Red Beach. Aided by a tank-dozer and a tank-scarifier, the engineers cleared mines from Alpha Red Beach, where explosives were thickly planted, particularly on the northern half. Naval demolition parties worked at the task of blasting out piling on Alpha Yellow Beach and tetrahedrons on Alpha Red Beach. Infantry and engineer minesweeping squads cleared exits to permit traffic in and out. Heavily mined areas extended generally no farther than 500 yards back of the beaches, and inland roads were virtually mine-free. During the morning of D-Day the beaches were occasionally shelled, but this ceased as the infantry advanced. There was no enemy air activity in the Alpha area.

Beach groups were slow to react to unexpected difficulties in unloading. Toward the end of D-Day they were reorganized in accord-

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

ance with changes in plan, and unloading was somewhat accelerated. The supply plan was based on five bulk-loaded LCTs averaging 130 tons each, ten Liberty ships carrying 1,000 tons each, and nine DUKWs, each with three tons of supply, combat-loaded on Liberty ships.

Three-quarters of the supplies loaded on LCTs consisted of ammunition, since it was anticipated that the assault would require a maximum of ammunition and a minimum of gasoline. However, the immediate breakthrough and rapid advance against light resistance altered these anticipated requirements. Gasoline very quickly became a critical item.

By 1400 hours all Alpha Yellow Beach landing craft were completely unloaded and combat loaders ten percent discharged, but on Alpha Red Beach the vast number of mines had delayed operations. After several disastrous encounters with mines all unloading over Red Beach was suspended until the beach could be cleared. Initially, the landing of DUKWs was delayed half an hour by small arms and mortar fire from isolated pockets on the beach, and later the total number available was found to be insufficient for handling the quantity of tonnage necessary in the rapid advance. The failure of small craft commanders to obey signals from beach groups resulted in landings at improper spots, where deep water drowned out vehicles.

Late in the afternoon of D-Day, difficulties in the complicated line of supply, from ships to shore to troops, began to straighten out. By H plus 20 hours all small craft except five LCTs were completely discharged. However, the unloading of ocean-type ships lagged far behind schedule, because all Liberty ships arrived at the transport area late. Seven of the ten Liberty ships due at noon on D-Day arrived at noon of D plus one and three not until the forenoon of D plus two. In spite of these difficulties approximately 15,900 men, 2,150 vehicles, and 225 long tons of supplies were unloaded during D-Day over beaches in the Alpha assault area. The 36th Engineer Beach Group established depots for the various classes of supplies and equipment, opened roads between the depots and the beaches, and controlled the enormous flow of traffic which poured inland.

To conceal these operations from possible enemy observation 640 smoke pots were fired on the Alpha beaches during the first three hours after the landing. As enemy resistance quieted, the smoke detail regrouped its smoke pots to be used in case of enemy air attack.

On 16 and 17 August the unloading over the beaches proceeded more rapidly, and a steady stream of supplies came in to support the advancing troops. By 1800 hours on 17 August some 48,198 men, 6,438 vehicles, and 1,060 tons of cargo had been landed and moved over the beach. Although Alpha Green Beach (260) was cleared and opened, the exits were found to be heavily mined. After D-Day the greater part of the unloading took place over Alpha Red Beach, since mines and obstacles had been successfully cleared. Statistics at the close of D-Day showed that there had been 203 casualties on Alpha Red Beach and 61 on Alpha Yellow Beach, a total of 264. This was far below expectation, considering the initial assault and constant flow of men and material. During D-Day 1,600 prisoners were taken by the 3rd Division; of this number 60 percent were non-German.

Delta Force

MAJ. GEN. WILLIAM W. EAGLES
". . . to land in the center . . ."

The 45th Infantry Division, commanded by Major General Eagles, was to land in the center of the VI Corps assault area at H-Hour on D-Day. The mission of the Division was to clear all the assault beaches of enemy resistance and then to advance rapidly inland to gain contact with the paratroopers at Le Muy. On the west, contact was to be established with the 3rd Infantry and on the east with the 36th Infantry Division.

This section of the coast included beaches 262, 263, 263-A, 263-B, and 263-C. Beach 262 at the head of the Gulf of St. Tropez was topographically desirable for landing operations, but the flanks were considered too heavily fortified. Beach 263 at the town of Ste. Maxime

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS DECLASSIFIED IAW EO 13526

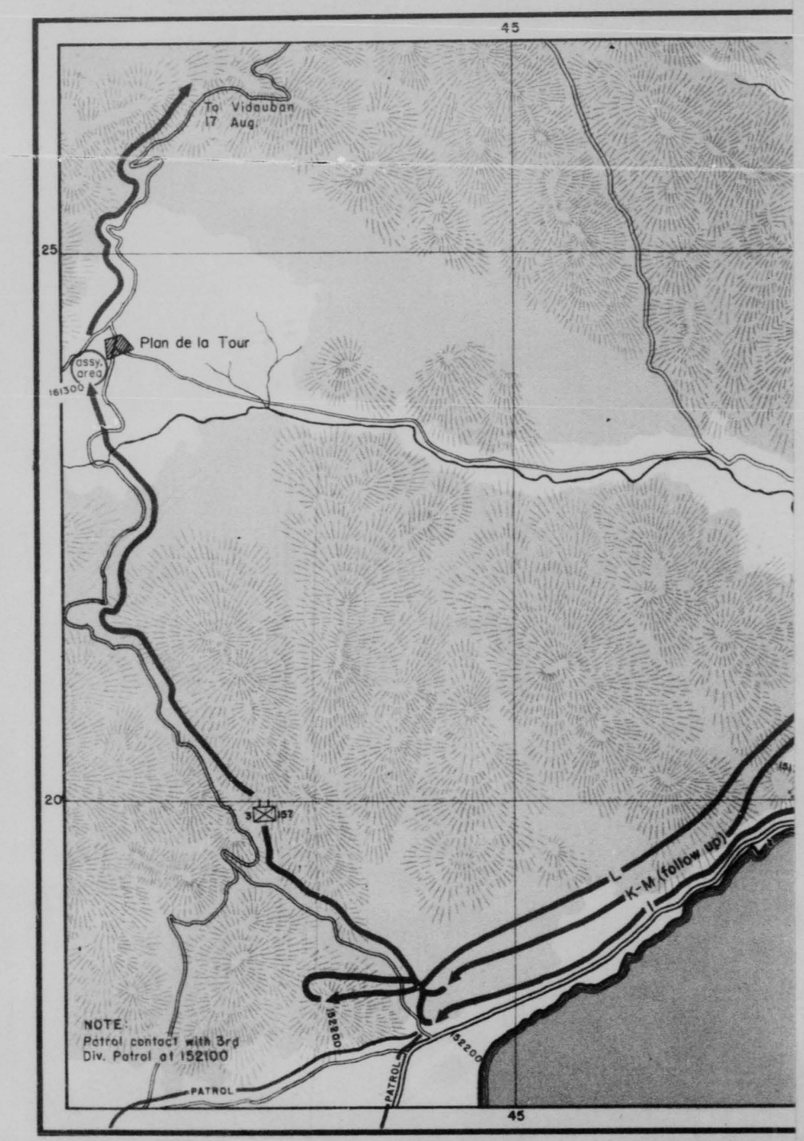
THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

was ruled out for similar reasons. The three small beaches selected for the 45th Infantry Division assault were approximately one mile east of the town of Ste. Maxime and lay along a curving bay between Cape Sardineau and Point Alexandre. On the left, Beach 263-A was divided into two zones of operation known as Delta Red and Delta Green. In the center, Beach 263-B was designated Delta Yellow, while the right flank beach, 263-C, was Delta Blue. The designated zone of operations for the Division was flanked by the 3rd Infantry Division on the left and the 36th Infantry Division on the right. The area extended inland 15 to 20 miles to the "Blue Line" at Le Luc and Le Muy, where the 1st Airborne Task Force had previously been dropped.

THE INVADING FORCES WADE IN TO THE BEACH
the 45th Infantry Division landed under almost ideal amphibious conditions . . .



For four hours prior to 0800, bombers and naval guns, covered the Delta beaches with a blanket of explosives. Small minesweepers came close inshore and swept the sea lanes to within 500 yards of the

beach. Scout boats reported no underwater obstacles off shore; thus the employment of drone boats was not necessary. At 0749 hours, as the assault boats loaded with infantry gathered off shore, the Navy fired a ten minute rocket barrage which lifted just before the first wave of troops hit shore.

The 45th Infantry Division landed under almost ideal amphibious conditions with four battalions abreast. The 3rd Battalion, 157th Infantry, landed on Red Beach; the 1st Battalion, 157th Infantry, on Green Beach; the 2nd Battalion, 180th Infantry, on Yellow Beach; and the 1st Battalion, 180th Infantry, on Blue Beach. The remaining battalions of the two regiments followed as the regimental reserve. By

or seriously damaged enemy beach defenses; and except for scattered small arms, mortar, and artillery fire there was no serious attempt to defend the beaches.

The 1st Battalion of the 157th Infantry cleared the beach area of enemy resistance and then moved inland approximately eight miles to assemble in the vicinity of Plan de la Tour. The 2nd Battalion, having followed the 1st ashore, spent the night in an assembly area near the beach and on the morning of 16 August moved to the town of Vidauban in the vicinity of the "Blue Line".

The 3rd Battalion, after having cleared the beach area, attacked toward Ste. Maxime, its first major objective. Civilians re-

ported that some 500 Germans had previously moved out at 0800 hours. However, when the advance elements of the 3rd Battalion, 157th Infantry, reached the outskirts of the town during the morning, they were

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

held up by fire from a pillbox on the quay and from street barricades. Field artillery and tank destroyers were brought up and sharp fighting ensued.

Upon entering Ste. Maxime from the north, I Company ran into heavy small arms and machine gun fire. For the next two hours there was fierce house-to-house fighting, during which the company made extensive use of hand grenades in clearing up small pockets of resistance. After the main resistance was overcome, one platoon was dispatched to mop up the waterfront. However, two strong points, one in the Hotel du Nord and the other in the dock area, continued to hold out. K Company then joined I Company in a coordinated attack on the hotel. This center of resistance was reduced only after stiff hand-to-hand fighting, which resulted in the capture of 70 prisoners and many enemy dead.

The 3rd Battalion then continued along the coast to Beach 262, which was promptly mopped-up. At 2100 hours it made contact with advance elements of the 3rd Division which indicated that enemy resistance along the coast between the Alpha and Delta assault areas had now been cleared. The 3rd Battalion moved on the Plan de la Tour, where it joined the 1st Battalion and spent the night.

The 180th Regimental Combat Team had as its initial mission to land on Beaches 263-B and 263-C (Delta Yellow and Delta Blue), to clear all resistance from the high ground east and northeast of 263-C, to capture the village of Villepey, and to assist the 36th Division in clearing Beach 264-A (Camel Red Beach) at the base of the Argens River Valley. It was then to move rapidly to the "Blue Line" and gain contact with the paratroopers in the vicinity of Le Muy.

At Delta Blue Beach (263-C) the 1st Battalion, 180th Infantry, landed without opposition and had only slight difficulty in scaling the sea wall. However, the four amphibious tanks from the 191st Tank Battalion were put out of action by mines on the beach when they attempted to land abreast before lanes had been swept. On Delta Yellow Beach only one tank was lost, since a different strategy was followed. A single tank proceeded inland across the beach, while the others fired on targets

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

from the waterline until a path was cleared. Later the personnel of the immobilized tanks procured standard tanks and continued in the advance.

After securing the beach the 1st Battalion, 180th Infantry, advanced east and north to the high ground overlooking St. Aygulf. Elements moving along the coast road drew heavy fire from enemy strongpoints, but tanks and tank destroyers were able to neutralize these defenses. By dark of D-Day the battalion had come up to the town of St. Aygulf, and at daylight the next morning the Battalion Commander ordered an attack. B Company moved up from the south and C Company, by means of a flanking movement, seized the high ground to the north. As the attack developed, B Company encountered stiff resistance and asked for tank as well as naval gunfire support. Two tanks were knocked out by enemy action, but the combined fire power of the company and its supporting elements finally drove the enemy from his positions. While this fight was in progress, B Company moved in and occupied St. Aygulf.

The 2nd Battalion, 180th Infantry, landed on Delta Yellow Beach (263-B), the Division center. Amphibious tanks began firing as soon as their tracks touched the ground. Four enemy pillboxes on the beach were immediately destroyed, but one tank was lost when it hit a mine. The battalion moved across the beach, suffering only four or five casualties, assembled, and then moved inland to high ground. During the afternoon the 2nd Battalion was ordered to advance north to Vidauban.

At H plus one the 3rd Battalion, 180th Infantry, landed on Delta Blue Beach (263-C), following the 1st Battalion. The 3rd Battalion advanced inland from the beach toward high ground. At first no contact was made with the enemy, but observers soon located Germans in vehicles and on bicycles moving toward a hill which dominated the area overlooking the Delta beaches. A running fight with small arms and mortars developed. The enemy was driven back, losing 12 killed and 30 captured; and the hill was occupied by dark of D-Day. Patrolling continued throughout the night of 15-16 August, and at daylight the battalion continued its advance toward Roquebrune.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

General Eagles, 45th Division commander, landed at 1100 hours on D-Day. Shortly afterwards the remaining regiment, the 179th Infantry, in reserve, debarked on Delta Green Beach (263-A) and assembled in the rear of the beach area. General Truscott, VI Corps Commander, came ashore during the afternoon. Since the other two regiments were making rapid progress against light resistance, the 179th did not see action until D plus one. The division advanced inland 15 August with comparative ease and rapidity. By 2300 hours reconnaissance troops had come within two miles of Le Muy and had contacted the airborne troops.

Personnel losses of the division during D-Day give an indication as to the ease with which the landing and initial advance were made. The 157th Infantry suffered 12 casualties, with only three of this number killed. The 180th Infantry had one officer and eight enlisted men killed and one officer and 48 enlisted men wounded. The 179th saw no action and suffered no losses. The total casualties for the entire division, including attached units, were two officers and 107 enlisted men. During the same period 205 prisoners were taken.

On D plus one the enemy was unable to take any kind of firm defensive action, and the 45th Division continued to advance. Except for small pockets of resistance consisting of antitank guns and uncoordinated infantry groups, there was no opposition of any importance.

The 40th Engineer Beach Group on the Delta beaches did not encounter the difficulties that were found on the Alpha beaches. The 1st Battalion Beach Group landed with the 157th Regimental Combat Team and initially operated Delta Red and Delta Green Beaches (263-A). Obstacles erected by the enemy to impede or prevent the advance of the infantry were quickly reduced. A line of concertina wire was gapped and a sea wall three feet thick breached. By the use of Navy pontoon causeways and five motorized cranes LCTs and LCMs were continuously unloaded, and this beach provided the principal source of supply for the 45th Division until D plus four. Immediately behind the beaches, dumps for all classes of supplies were established and operated. DUKWs were utilized until regular trucks became available, both for the unloading of ships and for land transportation.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

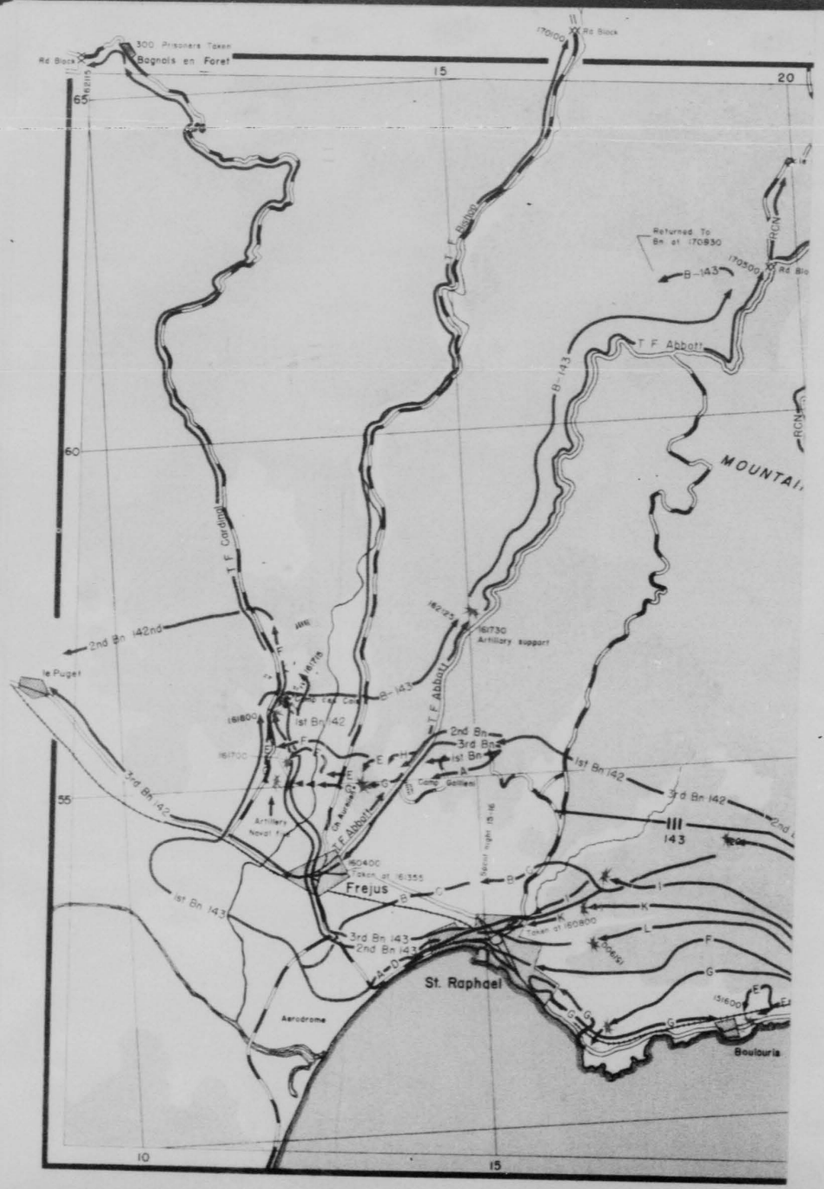
THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

The 3rd Battalion Beach Group, supporting the 180th Regimental Combat Team, landed on Delta Yellow Beach (263-B) and Delta Blue Beach (263-C). Here the gradient was sufficient for landing craft to come directly up the beach so that unloading could be accomplished on dry ground. Limited supplies for the immediate support of the infantry were stored in dumps behind the beaches; but, since Delta Blue Beach was small with difficult exits, it was closed on D plus one after the opening of Beach 263 on the Gulf of St. Tropez.

At H plus 11 hours the 2nd Battalion Beach Group of the 40th Engineer Regiment landed behind schedule on Alpha Yellow Beach (261). The Beach Group assisted the 36th Engineers in clearing mines and booby traps from the area and then moved inland to arrive at Beach 262 and St. Tropez. Battalion troops cleared the port of St. Tropez and opened berthing space for seven LCTs. After clearing lanes through a mine field behind Beach 262 to the west of St. Tropez, they opened berthing space for six LCMs, 19 LCIs, five LCTs, and a solid landing lane for DUKWs. This beach, now designated Delta Red Beach number 2, had the largest capacity in the area with dumps and depots conveniently located nearby.

During D-Day alone more than 33,000 troops and 3,000 vehicles were unloaded over the Delta beaches, the only hindrance being scattered mortar fire during the morning. On D plus one the enemy attempted to interfere with unloading operations, when a flight of five Ju 88s dropped antipersonnel bombs in the vicinity of Ste. Maxime. Antiaircraft units destroyed one of these raiders and drove the others off. However, some casualties were caused by the bombers.



A landing strip for artillery observation planes was rapidly constructed on the beach by the 120th Engineer Combat Battalion. Other engineer troops cleared and widened supply roads, removed mines, filled craters, blasted obstacles, and built other landing strips on the St. Tropez peninsula to make the area into a suitable base for handling supplies. By evening of D plus two these improvised ports had landed 53,360 troops and 6,818 vehicles and had handled 5,172 tons of miscellaneous supplies.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

At the close of D plus one the 45th Division had finished mopping up enemy resistance in the Delta area and had reached all points on the "Blue Line". All the Division's missions had been accomplished and 929 prisoners taken. Three officers and 229 enlisted casualties were reported. Contact with the other divisions on the flanks was being maintained, and the 1st Airborne Task Force was met in the interior. All Delta beaches were cleared and operating effectively. The Seventh Army's center was secure and the build-up progressing satisfactorily.

Camel Force

MAJ. GEN. JOHN E DAHLQUIST
securing the right flank

The 36th Infantry Division, Camel Force, commanded by Major General Dahlquist, had the initial mission of securing the right flank of the invasion beaches. The designated Camel area extended from St.Aygulf Point on the right flank of the 45th Division area along the coast line to Theoule-sur-Mer on the Gulf of Napoule. Inland it stretched 20 miles along the right bank of the Argens River, including the important road junction and town of Frejus, Puget-sur-Argens, and Le Muy; and on the right the high ground of the Esterel Forest. The coastal area included the spacious, sandy, but heavily fortified, Beach 264-A at the mouth of the Argens River. This beach was designated Camel Red Beach, and plans called for its reduction at H plus six by land assault from the rear and frontal assault by sea. Camel Green Beach (264-B) lay to the west of Cape Drammont and was considered large enough only for initial operations. Camel Yellow Beach (265) on the Rade d'Agay was also scheduled for reduction from the rear. On the extreme right flank of the invasion coast Camel Blue Beach (265-A) at an inlet near Point Antheor was small and not well suited for major landing operations.

Although the Camel assault area was considered to be strategically important because it offered a suitable entrance into the interior

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

by way of the Argens River Valley, it nevertheless presented certain obstacles. The principle beach, 264-A, at the mouth of the Argens River, was considered too strongly fortified for an initial assault and therefore was not used. The other two beaches were small and could hardly be called beaches in the technical sense of the word. They consisted of narrow strips of rocky shale between the water and steep embankments.

The initial mission of the division was to assault Camel Green Beach (264-B) and Camel Blue Beach (265-A) and to make a land assault on Camel Red Beach (264-A) at Z-Hour (H plus six) from each flank. The division was then to seize Agay, St. Raphael, and Frejus and push inland to Le Muy. It was also to be responsible for protecting the right flank of the assault area by establishing a defensive line from Fayence to La Napoule in the mountainous terrain west of Cannes. On 20 August this force was to be relieved by the 1st Airborne Division. At the same time the 36th Infantry Division was to be prepared to advance on Corps order to the northwest after reaching the "Blue Line" in zone.

Because of the limited sizes of the beaches selected for the initial assault, plans called for a landing of two battalions of the 141st Regimental Combat Team abreast on Camel Green Beach and the other battalion on Camel Blue Beach. The mission of the 141st Infantry was to destroy the enemy force occupying the area around the Rade d'Agay and then move north to a line generally west through Theoule-sur-Mer. The regiment was to protect the right flank of the division until relieved by the 1st Airborne Task Force. Initially the 143rd Infantry was to land over the beaches cleared by the 141st, pass through the 141st Infantry, and continue on its mission of clearing the coast and capturing the town of St. Raphael. The 142nd Infantry Regiment was to land over beaches cleared by the 141st in the event that landings at St. Raphael were impossible.

The Camel convoy arrived in the transport zone in the early morning of 15 August. For over an hour the Navy had been shelling the beaches from battleships and cruisers. The scheduled bombing of the beaches by the Air Corps had to be partially cancelled because of

overcast weather along the coast. Shallow-draft minesweepers swept lanes to within 500 yards of Camel Green and Blue Beaches, and small boats acting as markers took up positions along these cleared lanes. Assault troops crouched low in their landing craft as boat serials formed and headed for the shore. Ahead of the first wave were rocket ships mounting tiers of rocket launchers. As these drew within firing range of the beach, they discharged their rockets in the defenses.

Advancing at full speed, the assault craft approached the beaches in the immediate wake of the rocket ships. At H-Hour the 2nd and 3rd Battalions, 141st Infantry, grounded their landing craft on the rocky shale of Camel Green Beach; the troops rushed forward in the face of slight machine gun, small arms, and antiaircraft fire. At almost the same time the 1st Battalion struck Camel Blue Beach under concentrated enemy fire. The Germans directed the fire of their antitank guns upon the assault boats and made several direct hits, causing casualties.

At 0805 hours elements from the 753rd Tank Battalion with eight amphibious tanks were floated 4,000 yards offshore from Camel Green Beach. As they came under heavy fire from the beach, a German antitank gun damaged the canvas of one, flooding the engine compartment. However, the tank was close enough to shore to get in without sinking. After beaching, the other tanks moved inland to positions 600 yards from the beach. As enemy opposition had almost ceased in the area, the amphibious tanks were stripped of flotation equipment and made ready for cross-country fighting.

The 2nd Battalion, 141st Infantry, after clearing the right half of Camel Green Beach, attacked north to swing around the coastal road and make contact with the 1st Battalion, which had landed successfully on Camel Blue Beach. A road block was placed across the coastal highway, and the high ground northwest of the Rade d'Agay occupied. By 1000 hours the village of Drammont and the cape south of it had been taken. Two hours later the battalion was attacking from the southwest in the direction of the village of Agay.

During the night of 15-16 August the 1st Battalion, 141st Infantry, made a slow advance along the coast road toward Theoule,

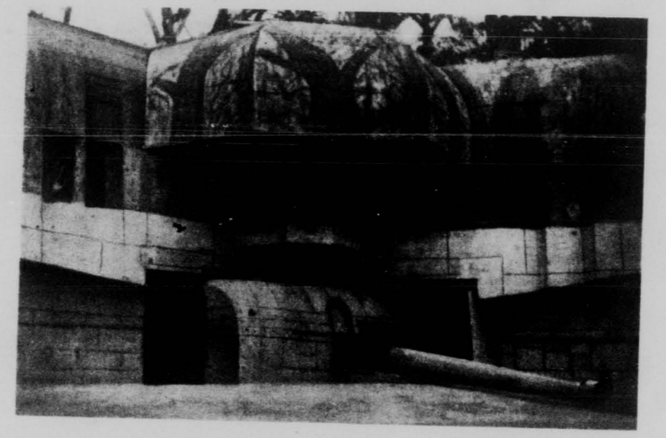
THIS PAGE IS UNCLASSIFIED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

since it was retarded by numerous pillboxes which had to be reduced. On the following day it captured Theoule-sur-Mer, moved north along the highway during the evening, destroyed road and railway bridges, and established a defensive position near La Napoule. That afternoon they had found the survivors of the French Marine demolition group (Rosie Force) and evacuated their wounded.



Meanwhile the 3rd Battalion, 141st Infantry, had cleared the left half of Camel Green Beach, destroyed all enemy strong points on the western end, and advanced down the coastal road 400 yards to establish a roadblock and occupy high ground overlooking the beach. Thus the 141st Infantry, now in strength and supported by tanks, tank destroyers, and artillery, had reduced the fortifications of the Agay area and had moved rapidly north and northeast toward its major objective; to establish and defend roadblocks, one north of Theoule-sur-Mer on the coastal highway and another west of Le Planestel, midway on the highway between Frejus and Cannes.

The 143rd Regimental Combat Team landed over Camel Green Beach in a column of battalions, 1st Battalion at 0945 hours, 2nd Battalion at 1000 hours, and 3rd Battalion at 1035 hours. The 1st Battalion moved forward to occupy high ground northwest of the beach. When relieved by the 3rd Battalion, the 1st moved toward the northwest of St. Raphael to assault the town. The 2nd Battalion moved up to attack the town from the east and with the aid of tanks and tank destroyers fought its way through a strongly fortified roadblock.

As a part of the mission of cleaning out the waterfront, E Company attacked from the rear 21 known enemy pillboxes, which were in position to fire into the harbor area. Meanwhile G and F Companies were working their way into St. Raphael from the southeast. Their attack was supported by naval gunfire and by several tanks and tank destroyers which had previously been attached to the 2nd Battalion.

The 142nd Regimental Combat Team was scheduled to make a delayed assault at Z-Hour (H plus six) over Camel Red Beach. This was to be the last and probably the most difficult assault in the entire

target area. The Navy reloaded rocket craft and prepared for a landing on the H-Hour scale. General Dahlquist had already gone ashore at 1000 hours.

COAST DEFENSE GUN AND CAMOUFLAGED BLOCKHOUSE ON CAMEL BEACH

. . . enemy pillboxes which were in position to fire into the harbor area . . .

The softening of Camel Red Beach was an important task and a heavy concentration of fire was brought to bear. At 1100 hours minesweepers moved forward to sweep lanes through the Gulf of Frejus; but as they approached the beach, they were heavily shelled and forced to retire. It was apparent that the beach needed more softening, and a flight of 93 B-24s came over the beach and dropped 187 tons of bombs. Fifteen minutes later the minesweepers started back toward the beach. At 1700 yards offshore they met a heavy artillery barrage but with difficulty managed to sweep to within 500 yards of shore. Naval fire support ships then took over and hammered the defenses with shell fire.

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Under this covering fire two demolition units with scout boats and 12 explosive drones were sent in. These also met heavy enemy fire.

Meanwhile the 142nd Infantry, in more than 100 assault craft, waited for the signal to land. At two minutes before Z-Hour the rocket ships let go their fire on the beach, but still no orders came to attack. It became apparent that something had gone wrong with the radio-controlled drone boats. Only three had exploded as planned, two grounded on the beach without exploding, one circled off the beach out of control, one exploded on the extreme left flank, two were boarded and put out of action, and one was sunk by gunfire from a destroyer when it reversed course and endangered the assembled assault boats. Two drones were never released because of the fear that they might run wild. It was now after 1400 hours, and the infantry was still waiting to come in.

The Beach Assault Commander radioed a report of the situation to Rear Admiral Lewis, commander of Task Force 87, and recommended that the assault be carried out at 1430 hours. The Admiral, however, ordered that the alternate plan of landing over Camel Green Beach be put into effect. The change in plan was relayed to the assault boats by radio and megaphone, and the fleet of small craft turned right to land the entire regiment over Camel Green Beach without loss. The above decision was made without the knowledge of General Dahlquist, who could not be reached on shore in time; but at 1740 hours he sent the following message to Admiral Lewis:

> I appreciate your prompt action in changing plan when obstacles could not be breached. Expect to take Red Beach tonight, no matter how late. Opposition irritating but not too tough so far.

The chief objective of the 142nd Regimental Combat Team was to take the town of Frejus by night of D-Day. The delay in landing plus the ten-mile march from Camel Green Beach to the Frejus area put the regiment behind schedule. Moving out from the beach after its landing at 1532 hours, the 1st Battalion took the lead and advanced along the railroad to Agay, where it turned west astride a secondary road and headed toward Frejus. Flank guards of company strength were out on either side to comb the wooded hills, while a platoon of four tanks

spearheaded the column on the road. The 2nd Battalion and 3rd Battalion of the 142nd Infantry followed as the main body.

The march was unopposed, but two small groups of enemy were cleaned out of resort hotels along the route. At nightfall the 1st Battalion, 142nd Infantry, reached the high ground northeast of Frejus. During the night of D-Day the regiment prepared for an assault on the town.

Elements of the 143rd Regimental Combat Team were by this time engaged at St. Raphael, the 3rd Battalion attacking from the right flank and the 2nd from the left. L Company, 3rd Battalion, became engaged in a fire fight with the enemy on high ground east of St. Raphael, while Companies I and K crossed the high ground to the northeast and closed in on the town. One enemy self-propelled gun opened up on the leading company, but was knocked out by a bazooka. Patrols reported enemy troops and guns inside St. Raphael. These troops were reinforcements being marched across the town from the northwest to try to stop the advance of the 2nd Battalion along the coast. Companies I and K continued to attack and engaged the enemy with small arms fire during the night of 15-16 August.

The next morning these two companies and two from the 2nd Battalion moved through St. Raphael clearing out most of the resistance. Meanwhile L Company overcame the enemy on the hill east of the town, taking 260 prisoners. By this time contact had been established by elements of the 45th and 36th Divisions, and their connecting flanks were secure.

The 1st Battalion, 143rd Infantry, had moved northwest around St. Raphael and joined the 3rd at the road junction north of town. The two battalions moved out on D plus one to clean up Camel Red Beach and the airport; they captured several high ranking enemy officers and much materiel. Prior to this time the 2nd Battalion, supported by tanks and tank destroyers, had completed the mopping up of the St. Raphael area.

The 142nd Infantry Regiment was at the same time engaged in the battle for Frejus. During the night of D-Day the 3rd Battalion

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

had passed through the 1st, moved on to Highway Seven at Camp Gallieni, and sent advance patrols into Frejus. At daylight street fighting broke out. Company L led 3rd Battalion attacks, as stubborn enemy opposition was overcome during the morning. Meanwhile the 2nd Battalion, following the 3rd, had stirred up a strongpoint of resistance at Camp Gallieni. A storm of flares, small arms fire, and mortar fire broke out from the heights. Elements of the regiment were engaged at Camp Gallieni during most of D plus one, and the 2nd Battalion pushed west to its original objectives, high ground south of Camp des Cais and the Camp itself, to secure the area northwest of Frejus. By mid-afternoon on 16 August enemy resistance in the entire Frejus area was

TROOPS OF THE 36TH DIVISION ENTERING FREJUS 16 AUGUST

". . . at daylight streetfighting broke out . . . . . By midafternoon the troops were mopping up . . ."

broken; the rest was mopping-up. The battalions, having completed their various assigned missions, assembled west of Frejus and moved to Puget.

The 3rd Battalion, 142nd Infantry, entered Puget late in the afternoon of D plus one and before nightfall had run into an enemy antitank strongpoint 1,200 yards beyond the town. During the night strong naval gunfire aided the artillery in shelling the position. An American paratrooper taken prisoner by this enemy group managed to escape during the shelling and, on reaching the American lines, reported that most of the enemy had spiked their guns and fled. On the morning of 17 August the Regimental Combat Team shuttled by battalions through Le Muy (which had been previously taken by the 509th Paratroopers) and arrived at Trans-en-Provence, the division zone on the "Blue Line".

The assault landing of the 36th Division had been successfully accomplished, although an alternate plan had been used. Casualty rates were low and the advance rapid, in spite of many doggedly defended strongpoints and roadblocks. By D plus two the division had cleared the Camel beaches and advanced to the Corps-designated "Blue Line", driving the enemy from a stretch of the coast which included the largest town and most important road junction in that target area.

Unloading operations on the Camel beaches during D-Day took place primarily on only one beach. In the initial landing on Camel Green Beach a small party from the 540th Engineer Beach Group came in with the first wave of infantry to reconnoiter the beach area. Largely because of the stony nature of the beach no mines were found, and no Sommerfelt matting was deemed necessary. Work was immediately begun on the construction of a two-lane exit on the right flank of the beach. Half an hour later, when the beach obstacle team and mine clearing detail landed, they were put to work on road construction, since there was no demolition work to be done. The engineer weapons sections assisted the infantry in reducing enemy resistance on the flanks. In spite of periodic shellings by enemy guns, the unloading of ships progressed satisfactorily. Battalion after battalion landed dry and passed over the beach.

During D-Day Camel Green Beach was perhaps the busiest place on the entire invasion coast. There were not only more troops landing in a smaller area than elsewhere, but there was also considerable air and ground resistance. At 2043 hours four enemy DO 217s

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

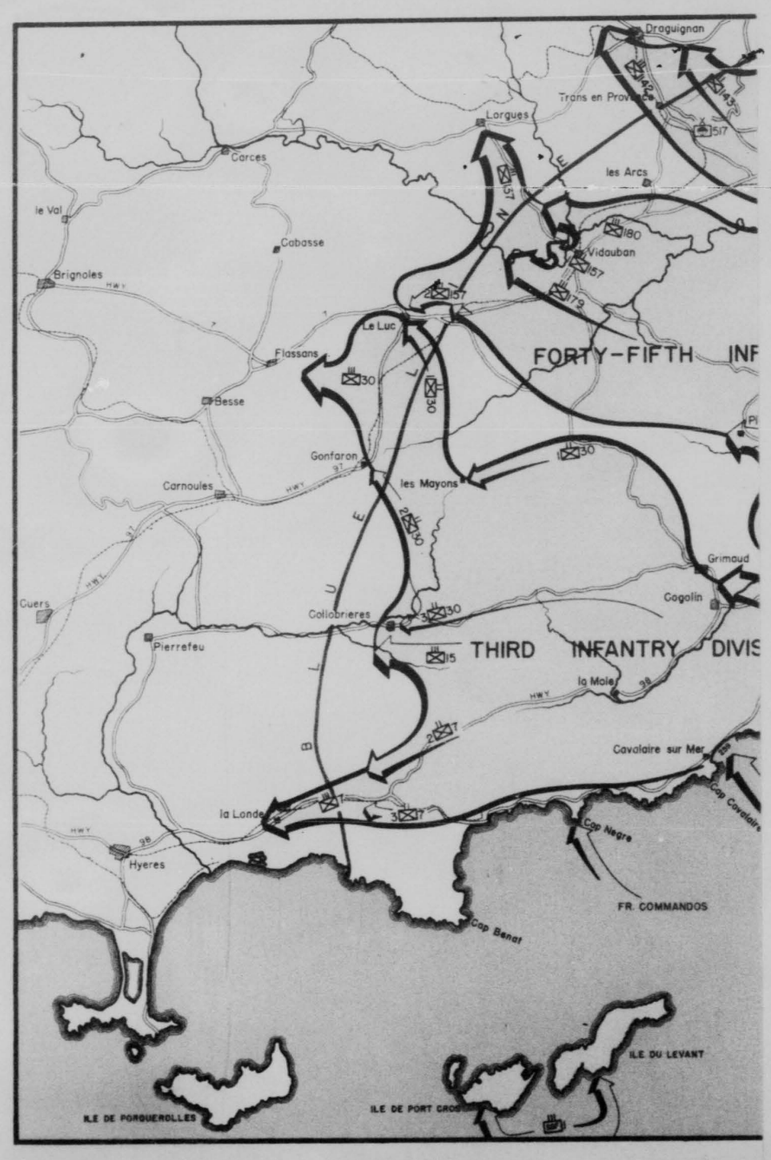
THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

approached the Camel area at 15,000 feet. After circling they descended to about 8,000 feet and dropped their bombs. One glider bomb destroyed an LST 600 yards offshore, resulting in 40 casualties and the loss of vehicles and ammunition.

During D-Day initial depots and supply dumps were temporarily established near Camel Green Beach. More than 2,790 vehicles and 17,390 troops were debarked. The 56th Medical Battalion, attached to the Beach Group, set up collecting, clearing, and aid stations, and evacuated 147 casualties that day. At the end of D-Day, military police had evacuated 94 prisoners to the far shore and were guarding many more in improvised pens.

EVACUATION OF WOUNDED FROM BEACH TO HOSPITAL SHIP
VIA LCVPs
". . . the beaches were soon neutralized and put into orderly, efficient operation . . ."



Unloading continued at Camel Green Beach, but it was not until D plus three that Camel Red Beach was finally cleared of mines

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

and put into operation. Meanwhile Camel Green Beach continued to operate on a 24-hour basis and sent a steady flow of troops and supplies inland, at the same time evacuating prisoners and casualties to the ships. At the close of D-plus-two more than 5,000 vehicles and 30,000 troops had landed, and over 2,800 prisoners and 800 casualties had been evacuated.

The Initial Objective Achieved

The assault on the southern coast of France had been a complete success. At the close of D-Day all the combat elements of VI

had been taken, and corps casualties had been almost negligible. The enemy could offer only scattered resistance. The German Air Force had been weak and ineffective. Enemy reinforcements never arrived in the

D DAY CASUALTIES: A GERMAN SOLDIER, A FRENCH WOMAN, A U. S. SERGEANT

". . . the assault casualties were almost negligible . . ."

beach area, and no large scale counter-attacks were launched. The three divisions advanced inland according to plan, already ahead of their time schedule.

During D-Day the Seventh Army Command Post continued operation aboard ship. At 1100 hours on 16 August General Patch, Vice Admiral Hewitt, and Admiral Lemmonier, the French Naval Commander, went ashore from the USS *Catoctin* to visit VI Corps Headquarters.

After an inspection of the Alpha area, the Seventh Army Commander returned aboard ship and conferred with General Wilson

and Admiral Cunningham. They assured him of all possible support from Theater resources. During the afternoon of D plus one General Patch conferred with Secretary of the Navy Forrestal, Admiral Hewitt, and Admiral Lemmonier aboard the USS *Wakefield* and later went ashore to visit the Camel area. Accompanied by General Dahlquist, he drove through the newly-liberated towns of St. Raphael and Frejus. There were numerous demonstrations of joy by the French population.

Seventh Army Headquarters debarked during the afternoon of D plus one and established its initial command post in a resort hotel west of St. Tropez. At the first staff conference ashore, held at 1400 hours on 17 August, the Chief of Staff announced plans for changes in

CHAPTER VII

The Capture of Toulon and Marseille

THE rapid development of the beachhead in the Seventh Army's invasion of southern France and the scattered disposition of German troops indicated that coming operations for *DRAGOON* would be a pursuit, a race to the north up the Rhone Valley, an eventual junction with Allied forces in the Paris basin, and the entrapment of German forces pulling out of France. But before a full exploitation to the north could be realized it was essential to have the port cities of Marseille and Toulon. That was the mission assigned to the French army of General De Lattre De Tassigny with full Allied naval and air support.

French Army B

At 2000 hours on 16 August French units of the Seventh Army began landing over beaches already cleared by the American VI Corps in the St. Tropez-Cavalaire area. Army B, as the French forces were designated, was to move from its assembly area through VI Corps and advance rapidly to the west against Toulon and Marseille. It was necessary to maintain contact with VI Corps during the operation and to integrate timing as closely as possible with the American unit.

Army B was made up of two corps divided into seven divisions, two of which were armored. However, only II Corps with supporting troops would be available for early operations, since I Corps would not begin landing until D plus 20. The French II Corps had four divisions. The 1st Infantry and the 3rd Algerian Divisions came ashore on 16 August. One combat command of the 1st Armored Division came in the next day; another of its units, Combat Command Sudre, had landed on D plus 1 as an attachment to the American VI Corps. On 18 August

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

the 9th Colonial Infantry Division, two groups of Tabors, and special troops began pouring over the beaches to give General De Lattre de Tassigny the major portion of his II Corps to maneuver against the enemy.

By this time most of the first echelon personnel, but only half the vehicles and heavy equipment had landed. In view of the developing situation, the Americans pushing ahead against relatively weak resistance and the slow progress of landing equipment, the French Commanding General decided to make certain modifications of pre-D-Day plans to expedite French participation in the overall Seventh Army picture. Troops were sent ahead to regroup in a forward area between La Mole and Collobrieres instead of waiting to assemble near the Cavalaire beaches.

The lay of the land between the beaches and Marseille influenced plans for attack. Wooded hills confined movement along two east-west roads. Highway 98 followed the coast from La Londe through Hyeres and Toulon to the great port city. The other axis passed through Collobrieres, Sollies-Pont, Le Camp, and Aubagne to Marseille. Various north-south roads linked these two lateral routes to permit the movement of troops from one to the other. Fortified heights north of the cities of Hyeres, Toulon, and Marseille were the main land defenses to be broken.

The enemy who had been unable to prevent the securing of a beachhead apparently could do little to contain it. However, by holding Toulon and Marseille it was possible at least to delay the exploitation of this initial success. It was expected that the German High Command would sacrifice its 242nd Division in Toulon and its 244th Division in Marseille to the last man to deny to Allied forces the use of modern deep water port facilities. Besides facing these two divisions the French command expected to meet elements of four others, including the mobile 11th Panzer Division coming from the Bordeaux-Toulouse area. The reoccupation of Toulon and Marseille would be a tremendous morale factor for the French and at the same time blast German hopes in southern France.

It remained for General De Lattre to convert strategy to tactics and for his troops to convert tactics to action. Outflanking and encirclement were the core of the tactical plan: first Hyeres, then Toulon, then Marseille. Speed and flexibility were means to the end. Army B was divided into five tactical groups. The first group, made up of the 1st Infantry Division reinforced by tank destroyer and engineer battalions, was to strike along the southern road toward Hyeres. The second group, the 3rd Algerian Division supported by tank destroyers, engineers, and Tabors of Goums, was to follow the northern road toward Toulon. The Goumiers are native troops from Morocco, organized into Goums which are similar to companies and Tabors which are similar to battalions. The third group, the 9th Colonial Infantry Division, reinforced by a tank destroyer battalion, was to support either of the first two. Elements of the 1st Armored Division and a regiment of Algerian Spahis made up the fourth group to which was assigned the mission of covering the northern flank of the assault area. A fifth group including a battalion of Senegalese riflemen, a Battalion de Choc, and the Groupe de Commandos, which was to return to Army B control on 21 August, would be employed for special missions.

Hyeres

On 19 August the 1st Infantry Division reinforced moved out of its forward assembly area along the coast road to Hyeres. As the troops approached the town, enemy fire from antitank guns within Hyeres and heavy shelling from larger caliber guns in the Maurettes Mountains brought the advance to a sudden halt. This hill mass north of Hyeres, dominated by Mt. Redon, blocked the coast road and was strongly fortified. One regimental combat team was detached from the main body and sent northward to infiltrate and encircle these positions. By 20 August Hyeres was cut off from the north and east.

To complete the isolation of the town the 9th Colonial Division had attacked the enemy from the Collobrieres approach to drive him from the north-south axis, Sollies-Pont to La Farlede. On 20 August resistance was encountered at Sollies-Pont, but the Colonials outflanked the town through woods to the north with a battalion of infantry supported by artillery and tanks. After a sharp conflict Sollies-Pont was occupied and the road south through La Farlede cleared of the enemy. Hyeres was then cut off on the northwest and effectually isolated.

THIS PAGE IS DECLASSIFIED IAW EO 13526

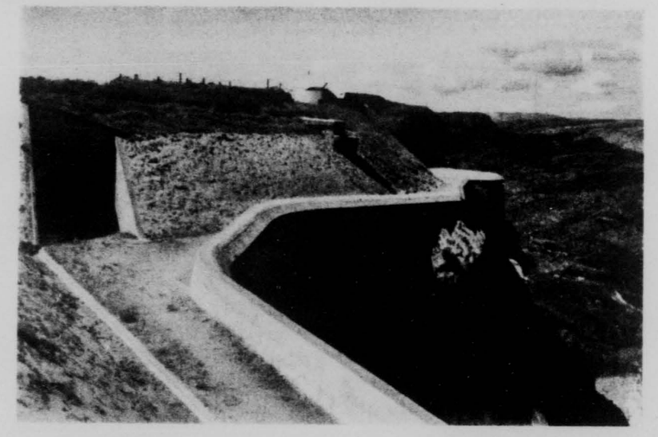
THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Meanwhile, the main body of the 1st Infantry Division pushed against Hyeres in a frontal assault from the east. The 4th Brigade attacked across the Gapeau River on the morning of 20 August but, after a slight penetration, was held up by heavy fire near the Golf Hotel north of the highway and on the outskirts of the city. Here the enemy had two antitank guns and three antiaircraft guns covering the eastern approaches. Infantry elements were withdrawn from the immediate area, and two battalions of 105mm and one battalion of 155mm artillery were ordered to neutralize the strongpoint.

At a point-blank range of less than 1,000 yards French artillery fired 1,000 rounds and registered more than 100 direct hits. In addition, Allied warships during the morning of 21 August fired over 200 shells into the town of Hyeres. One infantry battalion was now able to close in on the Golf Hotel. Fierce hand-to-hand fighting brought the battalion to within 50 yards of the strongpoint. At 1900 hours a bayonet charge was made in the face of heavy enemy fire and all resistance overcome. Many German dead were found and 140 prisoners taken.



As troops of the 1st Infantry Division passed through Hyeres on the Toulon road it was decided that one motorized battalion would be left behind to assist the French Forces of the Interior in mopping up isolated pockets. The rest of the division moved toward La Valette, where, with the 9th Colonial Infantry Division they could use similar technique and apply the same pressure against Toulon.

The island of Porquerolles southeast of Hyeres, and Giens, the long point of land reaching out toward the island, had been blasted by naval guns on 18, 19 and 21 August. The USS *Eberle* removed 140 Armenian prisoners from Porquerolles on 21 August and reported that a strongpoint of 150 Germans still remained. Two patrol boats guarded the island to prevent their escape. On the following day bombardment was continued. A white flag was raised on Porquerolles and at 1130 hours the USS *Omaha* accepted the surrender of the enemy garrison. Later the same day 190 Senegalese troops were landed as a detachment. The battery on Cap de l'Esterel, the eastern tip of the Giens Peninsula, remained active until 23 August when it also sent up a white flag. French troops were then landed on the peninsula against no resistance.

Toulon

The encirclement of Toulon had begun on 20 August, the day before the reduction of Hyeres. The 3rd Algerian Division and its supporting troops had left an assembly area near Collobrieres on 18 August and followed the inland route toward Marseille, by-passing to the north the town of Sollies-Pont, where the 9th Colonial Infantry Division engaged the enemy. By 19 August it had reached Meounes and split up into three groups.

The hills above Toulon rose in an arc, Mount Caumes north of the city dropping down south and a little east to Mount Faron, around

FORT de la CROIX FARON'S TYPICAL WINDING, HIGH WALLED WALKS
". . . all three heights, Caumes, Faron, and Le Coudon, had been made into heavily fortified strongpoints . . ."

which the suburbs of Toulon had crowded, stretching east and a little north to Le Coudon. The rim of the cup pushed the city against the bay. All three heights, Caumes, Faron, and Le Coudon, had been made

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

into heavily fortified strongpoints. Besides these defenses north and east, St. Mandrier Peninsula south of the city bristled with guns.

The harbor defenses and the mountain strongholds were the outer ring of steel. The inner defenses of Toulon were also formidable. All approaches to the city were blocked by antitank obstacles, pillboxes, and mine fields. Defense zones had been set up with blockhouses and firing trenches well protected by wire and mines. All bridges and viaducts were prepared for demolition, and charges were placed in high earth banks to cause landslides. It was estimated that 60 heavy and 100 light guns were available to defend the city, and even guns from the sunken battleship *Province* were thought to have been moved ashore. Forts Ste. Catherine, d'Artigues, de Malbousquet, and Lamalgue among others within the city were known to be especially heavily fortified.

Near La Farlede the 9th Colonial Division had come under German artillery firing from Mt. Coudon. On 21 August the Groupe de Commandos, having returned to Army B control after the assault at Cap Negre and engagements west along the coast, and having approached against resistance by way of La Guiranne, moved forward to seize the heights of Le Coudon and destroy the enemy. Commando troops advanced toward their objective at 0800 hours and leading elements ran into small arms fire almost at once on the Coudon slopes. The ridge was fortified by five separate gun emplacements and a fort on the eastern peak. By noon one of the batteries had been overrun.

The 1st and 3rd Commandos, the assault battalions, came up against strong resistance at the Fort Est du Coudon. Close fighting continued for three hours during which time grenades and rocket guns hammered at the fort until it capitulated at 1700 hours. While the commandos were scaling the walls by rope to receive the surrender, Germans inside signaled by flare for their own artillery to begin firing. Heavy shells came in and caused several casualties among both captors and captured. After enemy firing had ceased, the commandos put a heavy mortar in position and were able to knock out two German 100 mm guns camouflaged in an orchard below.

After Mt. Faron had been taken by the Battalion de Choc on 22 August, the Groupe de Commandos moved out the following day

to mop up the area between the heights of Le Coudon and Mt. Faron. As troops made their way down the slopes, they heard firing back on the crest at Le Coudon. Apparently a group of Germans driven from La Valette by troops of the 9th Colonial Division were trying to infiltrate and recapture the fortifications. Orders were issued to hold Coudon at all costs, even at the expense of mopping up operations. The 2nd Commando Battalion was left to reinforce the 1st at the fort, while troops of the 3rd moved out on their original mission. On 24 August they drove the enemy from a series of rock quarries west of Le Coudon using mortar fire followed up by flame throwers. The defenders, fleeing toward La Valette, surrendered to the Senegalese.

In the meantime the 3rd Algerian Group north of Toulon had been subdivided into three smaller tactical groups named after their respective commanders, Linares, Bonjour, and Chapuis. Each had an average strength of about two battalions with attached reconnaissance elements. As the Algerian troops turned toward the enemy between the Meounes-Le Camp axis and the sea, the 1st Armored Division and supporting troops filled in on their north flank, pushed on toward Aix-en-Provence, and maintained liaison with the American 3rd Division.

Just west of Meounes the Linares group detached itself from the main body, turned south, and infiltrated through the Morieres Mountains to reach the village of Le Revest-les-Eaux. Here the watershed of the Morieres follows a deep gorge, the ravine of the Dardennes, which runs to the very heart of Toulon. This route was well defended by the dominating heights of Mt. Caumes to the northwest and Mt. Faron to the southeast. Colonel Linares' group, now reinforced by a Battalion de Choc, received orders from General De Monsabert, commander of the 3rd Algerian Division, to increase pressure on Toulon by reducing Faron heights.

This action was entrusted to the Battalion de Choc. The La Valette-Dardennes-Toulon road encircling Mt. Faron had already been cut by a roadblock set up near the Chateau de la Repelle; on 21 August Captain de Peretti de la Rocca had led Algerian troops against the German Chateau strongpoint and held the roadblock against two counterattacks. Mt. Caumes had been neutralized the same day by the 3rd

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Rifle Regiment of the Linares group. On 22 August the Battalion de Choc enveloped and climbed over Mt. Faron to capture the entire German garrison. Troops now filtered into Toulon through the Dardennes ravine. The enemy was surprised by this maneuver north of the city but lost no time in assembling his forces near the Poudriere (powder magazines) on the waterfront and launching violent counterattacks.

By the reduction of the three great mountain forts of Caumes, Faron, and Le Coudon the French had isolated Toulon from the north and had gained the topographical advantage of high ground looking down on the city. While this action was in progress, the 3rd Algerian Division minus the Linares group continued along the northern Marseille road through Signes and up to the nodal town of Le Camp by 20 August. Here the Germans blocked the north-south highway which led into the Toulon-Marseille coastal road. The Bonjour group was detached from the westward advance and sent to clear the roadblock. The detachment, then reinforced by a battalion of tank destroyers, pushed through Le Beausset to Ollioules in the suburbs of Toulon. The isolation of the city from the west became complete as soon as reconnaissance troops of the Bonjour group reached the sea at Bandol and placed tank destroyers across the coast road leading to Marseille.

By 23 August Toulon was actually under siege. Between 20 and 24 August the French had surrounded and isolated the city from three directions. The 9th Colonial Infantry Division and the Commandos had forced open the Sollies-Pont-La Farlede defile and occupied Le Coudon to make possible the westward advance of the 1st Infantry Division along the base of the Hyeres-La Farlede-La Valette triangle. On 23 August the 9th Colonial and the 1st Infantry Divisions ran up against the eastern gates of Toulon.

The German defenders of Toulon had received orders to fight to the last man. In spite of the hopelessness of their tactical situation the 242nd German Infantry Division resisted stubbornly and fanatically. From the four main bastions of Ste. Catherine, d'Artigues, de Malbousquet, and Lamague, within the city, the enemy directed well-aimed artillery and mortar fire against the attackers. Moreover, camouflaged blockhouses and pillboxes covered by well concealed mine fields made

infiltration tactics extremely difficult. Finally, 2,000 German sailors holding the St. Mandrier Peninsula engaged in heavy artillery duels with the French about the periphery of the city.

The complete occupation of Toulon required the combined efforts of the French Army, the XII Tactical Air Command, and the Western Naval Task Force. By land the French established a solid ring of six battalions of 155mm guns and an equal number of 105mm guns tight against Toulon. Observation posts on the heights above the city gave their fire great accuracy, and round after round crashed in on the defenders.

FORT D'ARTIQUES, TOULON

". . . round after round crashed in on the defenders . . ."

The air force had concentrated its bombing on the St. Mandrier Peninsula to knock out artillery installations and to cut off the enemy from the mainland. Beginning on 18 August bombers swarmed the Toulon area, as 91 B-26s blasted St. Mandrier. The next day 71 bombers

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

returned with the same mission. On 20 August fighter-bombers continued the attack. Each carrying two 500 pound bombs, 121 P-47s hit the St. Mandrier installations, while B-26s dropped 161, 1,000 pound bombs. Enemy antiaircraft fire was accurate and intense; 28 aircraft were hit by flak and three destroyed. Good bomb patterns were achieved with possible direct hits. The next day planes sank small enemy craft in Toulon harbor. The XII Tactical Command returned to the Toulon area on 24 and 25 August to add a few final touches to the air bombardment pattern.

Meanwhile, the Western Naval Task Force gave support from the sea. On 19 August the FS *Lorraine*, USS *Nevada*, and USS *Augusta*, screened by smoke and covered by fighter planes, had fired 87 rounds on St. Mandrier and 124 rounds in Toulon with a direct hit on the French battleship *Strasbourg*. The attack was stepped up the following day; and enemy guns on St. Mandrier, at least one of the 340 mm size, shot back, firing about 60 rounds slowly and accurately at a 14 mile range. The FS *Fantasque* and FS *George Leygues* were hit by 155 mm shells, and the USS *Ericsson* was straddled. On 21 August coastal guns were less active, scoring near misses but no hits. The naval bombardment continued for eight successive days with rising intensity to the 26th of the month when cruisers closed to within five miles of the St. Mandrier fortress. All ships ceased fire at 1630 hours. Explosions and fires were observed. On 27 August a light bombardment on positions south of Toulon received no answering fire. The formal surrender of St. Mandrier the following day ended the resistance.

Through liaison shore groups, naval gun fire was also available to the advancing land forces for call on specific targets. The 1st Infantry Division moving up along the coast from Hyeres had met stubborn resistance at German pillbox positions on concentric defense lines from Le Mont des Oiseaux and San Salvador through Carqueiranne, Le Pradet, and La Garde, southeast of La Valette. The enemy defended fiercely, launching many counterattacks; and the French suffered heavy casualties. As division troops pushed on west, one battalion of the Foreign Legion besieged San Salvador for six hours on 22 August. Fire

from Allied warships was poured on the defenses. The battalion finally broke through and took seven officers and 340 enlisted men prisoner.

On the same day troops of the 9th Colonial Division were fighting at La Valette. The 6th Senegalese riflemen, led by Chef de Bataillon de Saint Germain, stormed the redoubt at La Platriere Ste. Anne and seized two pillboxes covering approaches to the town. Enemy resistance was beaten down only by constant assault.

Against the background of booming naval guns, troops of both divisions east of Toulon penetrated the city. By 1700 hours on 23 August advance elements had reached the center of Toulon. Major Victor Mirkin moved up with two tanks to the Military Arsenal in the Le Mourillon section of the city. He entered the arsenal and told the German commander that, unless he surrendered immediately, the fire of Allied warships would be brought down on the garrison. The commander capitulated, surrendering 17 officers and 800 enlisted men.

On the morning of 24 August enemy forts and strongpoints began to give up one after the other. At 0900 hours the Naval Arsenal gave up with 200 prisoners. At 1000 Fort Ste. Catherine surrendered, and at 1300 the German garrison at Fort St. Louis was ordered to spike its guns. Three other forts capitulated during the afternoon, and by dark organized resistance in the eastern part of Toulon came to an end. On this day alone the 1st Infantry Division had taken over 2,000 prisoners.

In spite of this early progress, pockets of resistance still held out in many parts of the city. The enemy held the dock area; and mopping up operations were intensified, particularly when a radio intercept indicated that the Germans had received orders to destroy all remaining port installations. Street fighting flared up at several points; it was particularly heavy in the quarters known as La Colette where the Germans were resisting from house to house.

While the last enemy strongpoints in the city were being overcome, French troops were also pushing southwest of Toulon down the Sicie Peninsula, which was studded with forts and pockets of Germans. During the day of 25 August surrender terms were discussed at many

THIS PAGE IS UNCLASSIFIED

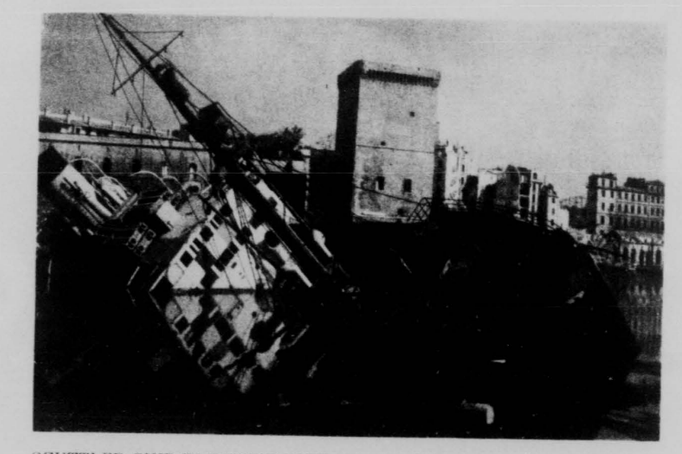
THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

of the fortifications and others were stormed. By 1900 hours Fort d'Artigues, northeast of La Colette, surrendered 20 officers and 200 soldiers. The Fort de Six-Fours in the middle of the Sicie neck agreed to capitulate effective 1200 the next day. After a sharp fight Fort de Malbousquet in Toulon gave up by 2200 hours.

On 26 August, heavy artillery fire was brought down on La Mitre in the Mourillon section of Toulon. Before noon this last enemy center of resistance within the city surrendered. The Six-Fours Commandant, having blown up ammunition depots at 0900, completed the terms of capitulation, giving up about 500 prisoners. By late afternoon other defenses on the Sicie Peninsula collapsed. Only St. Mandrier remained in enemy hands.



At 1745 hours the following day General Magnan, commanding the 9th Colonial Division, stopped all artillery which had been firing counterbattery on the eight enemy gun positions still intact on St. Mandrier and requested cessation of naval fire. Negotiations were begun for the surrender of the garrison. It was agreed that capitulation would become effective at 0600 hours on 28 August. The entire garrison was taken prisoner including the commanding officer of the Toulon defenses, Admiral Ruhfus. At 1000 hours the same morning General De Lattre De Tassigny made his formal entry into Toulon. On 28 August Marseille also fell.

Marseille

The movement of French Army B against Marseille had begun as early as 20 August when the Chapuis group of the 3rd Algerian Division pushed west above Toulon. Units of the 1st Armored Division, now including Combat Command Sudre, which had been screening the French Army's northern flank and maintaining contact with the American 3rd Division in and about Brignoles and along Highway 7 toward Aix-en-Provence, also turned toward Marseille. Together the two French Divisions advanced in a single operation. The maneuver against Marseille was to be similar to that used against Hyeres and Toulon: rapid encirclement, isolation, and pressure from all sides.

The natural defenses of Marseille were not as formidable as those of Toulon. However, the Etoile Mountains ran in a chain from Aubagne to Aix and gave some protection northeast of the city. Within Marseille the heights of Notre Dame de la Garde were well manned and well fortified, and in the port area enemy artillery and mortars covered all the approaches. In the bay the islands of Ratonneau and Pomegues guarded the sea lanes with strong forts.

In addition to offshore mine fields, booms, nets, and submarine detectors, blockships were anchored at strategic places in the harbor to be sunk on short notice and thus hamper full use of port facilities. Shore

SCUTTLED SHIP BLOCKING ENTRANCE TO THE PORT OF MARSEILLES

". . . blockships were anchored, by the enemy, at strategic places in the harbor . . . to hamper full use of port facilities . . ."

defenses included heavy coastal batteries and several railroad spurs built specifically to handle railroad guns with a caliber up to 15 inches. Mines were planted along the beaches as well as on all roads leading

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

inland. It was estimated that for anti-aircraft protection the city had 170 guns of all calibers supplemented by searchlights and barrage balloons.

Since Marseille did not have the same system of well integrated hill-top fortresses as did Toulon, the Germans had placed greater stress on an elaborate defense of the suburbs to block off all entries to the heart of the city. On all main roads branching out from the city's hub were roadblocks and antitank mines. At Marignane, northwest of Marseille, the most important airfield in the area was defended by several batteries of antiaircraft guns and antitank ditches. The highway north to Aix was crossed by concrete blocks and dragon's teeth flanked on either side by an antitank wall six feet thick at its base. Peypin, northeast, and Aubagne, directly east of the city, were both strongly held by roadblocks and entrenched enemy forces.

General De Monsabert, commanding the 3rd Algerian Division, shifted the forces at his disposal and moved them along the arteries leading to Marseille. With the Chapuis group were the 7th African Tank Destroyer Battalion, the Tabors of Goums, and the 1st Armored Combat Command under General Sudre. Toward the end of the morning on 21 August, Combat Command Sudre arrived at the Le Camp road junction and received orders to advance on Marseille from the east, and at the same time outflank the city to the north, by moving toward Aix. The Combat Command was to seize and hold the Aubagne-Gemenos-Coulin highway triangle.

GENERAL SUDRE
". . . advance on Marseilles . . ."

This force moved out from Le Camp, by-passed Cuges, and ran up against the strongly held enemy road blocks at Aubagne. On 22 August armored elements were left here to tie down the enemy, while infantry swung north to cross the Aubagne-Peypin axis between these two strongpoints and filter through the Etoile Mountains into Marseille. Advance troops of the 7th Algerian Rifle Regiment, after a nine-hour climb over difficult terrain without encountering the enemy,

reached the northeast suburbs of Marseille at the St. Jerome and La Rose districts.

Meanwhile, one group of Goums moved farther north through the Etoiles before swinging west to cut communications on the city's north flank. A second group of Goums had moved south of Aubagne to overrun the road system between Marseille and La Ciotat. Desperate appeals for assistance by the French Forces of the Interior already fighting within Marseille hastened the assault on the city.

By 23 August the three battalions of the 7th Algerian Regiment were closing in on Marseille from three directions: the 1st just east of the city on the Aubagne highway, the 3rd coming into the northeast from the direction of Allauch, the 2nd moving down to the north having swung through St. Savourin and the Pilon du Roi. Combat Command Sudre supported these advances and assisted in mopping up operations at Aubagne. The 2nd Combat Command of the 1st Armored Division, having broken enemy resistance on the heights of Peypin, moved up to relieve the American 3rd Division at Aix, Gardanne, and Rognac. The occupation of these cities by Allied troops had cut off the Germans from their main communication with the Rhone River Valley. Two days later, when the group of Goums north of Marseille captured Septemes and surrounding suburbs, the city was completely isolated. On 23 August Colonel Chapuis and General De Monsabert moved into Marseille and set up command posts.

The General, from his headquarters at the Hotel du Quinzieme Corps, undertook negotiations with General Schaeffer, commanding the German garrison, beginning the evening of 23 August. They did not arrive at any agreement. The 244th German Infantry Division intended to fight for the city. The enemy still held all the forts in the port area and threw heavy artillery fire against the French forces which began to enter the city from all sides.

The next day Marseille was invested by troops of the 3rd Algerian Division and Combat Command Sudre. One battalion of Algerian riflemen seized and held the Vieux Port in the center of the city. Another held the Madeleine and Blancarde districts, which effectively bisected Marseille. The third was engaged in reducing enemy

THIS PAGE IS UNCLASSIFIED

defenses in the suburbs of Beaumont. Still the fighting continued. The Germans held firmly the fortified heights of Notre Dame de la Garde just south of the Vieux Port as well as forts along the water's edge. The enemy launched counterattacks from their positions, but were held.

On 25 August elements of the 3rd Algerian Division which had been fighting at Toulon joined the southern group of Goums; together they moved along the La Ciotat road and into the southern part of Marseille. They occupied La Seigneurerie, Ste. Marguerite, and St. Louis. They continued the attack toward Notre Dame de la Garde.

As the battle for Marseille moved into its final phase, the weight of naval and air bombardment pressed the defenders into an increasingly hopeless situation. Fighter-bombers of the XII Tactical Air Command carried out missions against the city's defenses in spite of intense flak that was thrown up. On 25, 26, and 27 August air attacks were concentrated on the islands of Pomegues and Ratonneau. On 24 August the USS *Nevada* had fired 200 rounds on Pomegues; the following day 354 rounds were thrown against the Marseille area. Mine-sweeping operations in Marseille waters were begun on 26 August with naval fire placed on the Frioules Islands and Cap Croisette south of the city.

Notre Dame de la Garde was now attacked from four directions. Two battalions of infantry plus a detachment of Goums, supported by tanks, fought their way to the summit before the German defenders hoisted a white flag and gave themselves up at 1000 hours on 26 August. The following day the area between Notre Dame de la Garde and Fort St. Nicholas to the northwest at the entrance to Vieux Port was mopped up. The fort itself, now under constant fire of French artillery, surrendered.

Scattered enemy pockets of resistance were still to be over-come in many quarters of the city. Sporadic firing continued throughout the 26th and 27th in the districts of Quatre Chemins, St. Joseph, and Le Melon in the northern part of Marseille. There were also engagements along the waterfront. The fighting near Septemes lasted for three days as Chef de Bataillon Roussel led his Goums through the alleys and gardens of La Gavotte and Moulin du Diable.

During the evening of 27 August a letter signed by General Schaeffer was delivered to General De Monsabert. The German commander requested an interview to discuss terms of surrender. At 0700 on 28 August he was brought to the Hotel du Quinzieme Corps. Particular emphasis was placed on preserving port installations which the Germans had hoped to render useless by means of large scale demolitions. Capitulation resulted not only in the liberation of the second largest city in France and the most important port on the Mediterranean, but also in the capture of the Commanding General, his

MARSEILLE

". . . the second largest city in France and the most important port on the Mediterranean . . ."

staff, and 7,000 prisoners of war. The Germans had not fought to quite the last man.

French Forces of the Interior had played an important part in the liberation of Hyeres, Toulon, and Marseille. As the army drew near,

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

resistance groups took up arms and occupied certain strategic points which had been abandoned by the enemy. Other FFI, taking advantage of the German system of organized strongpoints within the outer ring of fortifications, created zones of insecurity which were a constant annoyance to the enemy. This was particularly true in Marseille at Borely Park, Viste Park, and Notre Dame de la Garde.

Since members of the FFI had made careful note of German gun positions and their fields of fire, the location of pillboxes, minefields, and antitank obstacles, they were of invaluable service in guiding patrols

HUNTING SNIPERS IN MARSEILLE

". . . French Infantrymen and FFI . . . mopped up . . . and continued to hunt out German snipers . . ."

to objectives with least loss of time and lives. Constant liaison was maintained between Army B and the resistance groups. However, when the FFI tried to come out openly and fight occupying enemy troops before the French army arrived, as was the case in Marseille, their

position became desperate and they sent out urgent appeals for aid. After the army's arrival in both Toulon and Marseille the FFI helped mop up isolated pockets of resistance and continued to hunt out German snipers and French collaborationists after the main enemy resistance had been broken.

At 1100 hours on 29 August troops taking part in the liberation of Marseille passed in review before the Commanding General of Army B. They were greeted by an enthusiastic crowd. The band of the 3rd Algerian Division played for the occasion, and the Marseillaise again rang through the city. The main body of French troops now moved north and west to cross the Rhone and follow up the Seventh Army's penetration of France.

Across the Rhone

As the siege of Marseille and Toulon came to an end, the enemy was in the midst of withdrawing his remaining forces up the Rhone Valley to prevent them from being cut off in southern France. It was thus decided that the French should pursue the retreating Germans up the west bank of the Rhone, while the American VI Corps continued its rapid advance up the east bank. Accordingly, the 1st French Infantry Division and the 1st French Armored Division moved out of the coastal area and made preparations to cross the Rhone River. Lack of sufficient gasoline coupled with the fact that the Germans had blown up all bridges over the river made this task difficult. However, by putting in temporary bridging across the Durance River and improvising a system of ferries on the Rhone, elements of French Army B were able to cross the Rhone in the vicinity of Avignon, Tarascon, and Arles by 29 August.

Crossing the Rhone continued until the end of August, and no contact was made with the enemy. Advance elements fanned out to the southwest and on the evening of the 30th occupied Nimes and Montpellier. Further reconnaissance was carried out as far as Sete, Beziers, and Narbonne without meeting any opposition. The 9th Colonial Infantry Division remained temporarily as a garrison force in the Marseille-Toulon area, while the 3rd Algerian Infantry Division

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

moved northward to the vicinity of Grenoble, where it relieved elements of the American 45th Division.

Army B in a space of 15 days had accomplished its assigned mission of capturing Toulon and Marseille and of keeping up its general advance to the north and northwest. By the division of its forces into functional groups to meet the problem of topography, and by the use of armored units to exploit unforseen tactical opportunities, Toulon and Marseille were quickly isolated and captured. In the final analysis it must be kept in mind that the seemingly brilliant tactics of the French were made possible only by the combined efforts of the entire Seventh Army from the moment of its initial assault. The American VI Corps provided the French with a secure right flank on land. The XII Tactical Air Command gave a complete offensive as well as defensive air cover, and the Western Naval Task Force provided the off-shore fire which was a major factor in the final surrender of Toulon and Marseille. Assured of close support by land, sea, and air, Army B was able to destroy two full strength enemy divisions and secure two major ports in a campaign which lasted only 13 days.

CHAPTER VIII

The German Retreat from Southern France

THE initial assault by the Seventh Army and its subsequent expansion of the beachhead opened the way for a rapid exploitation inland. By D plus 2 a definite breakthrough had been accomplished, and the German Nineteenth Army was in serious danger of being cut in two.

The enemy's first line of defense followed an east-west arc, paralleling the coast from a point where Highway 7 approached the Durance River near Orgon eastward to the vicinity of Cannes. This primary line provided for a narrow zone stretching from the coast to points 15 to 20 miles inland. But by 18 August it was overrun by the advance of the 3rd Infantry Division westward along Highway 7 and by the occupation of the coastal area east of St. Raphael by the 36th Infantry Division. A secondary defensive line was established some 30 to 40 miles inland along the axis of the Durance-Verdon Rivers. Even this line was soon threatened by the rapid penetration of the 45th Infantry Division through Barjols toward the Durance River.

It soon became clear that the Germans had been caught on D-Day with the great bulk of their defensive strength far to the west of the assault beaches. Even as late as 17 August only the 338th Infantry Division of the four enemy divisions west of Marseille appears in the enemy order of battle. The three remaining divisions west of the Rhone River apparently experienced great difficulty in moving into the combat zone. Pre-D-Day bombardment had wrecked all but one bridge across the Rhone, and the shortage of trucks and motor fuel hampered any large scale movement of troops.

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

The northwestward advance of the 3rd and 45th Divisions tended to isolate from the rest of the Nineteenth Army the two enemy divisions (242nd and 244th) defending Toulon and Marseille, although contact was made with elements of both shortly after D-Day. The German 148th Reserve Division, which was responsible for the defense of the coastal region from east of Toulon to the Italian border, became separated from the 242nd on the west as a result of the Allied beachhead. By 16 August it was retreating under pressure toward the Italian frontier. Elements of the enemy 157th Reserve Division attempted to move south from Grenoble toward the assault area but were turned back by Task Force Butler at Digne and Gap.

Failure of the defending forces to hold the Seventh Army at least temporarily in the immediate coastal area may be attributed largely to five major factors. The enemy, failing to solve cover plans for Operation DRAGOON, had disposed his divisions with reserves too far west. As additional troops became available they were committed in a piece-meal fashion, the result of route interdiction and motor transport shortage. Coastal units in general were weak. They were poorly equipped and lacked sufficient air support, armor, and heavy artillery; it was estimated that about half their troops were Russian, Czech, Turk, Pole, and other non-Germanic peoples. Early in the advance inland the German LXII Corps Headquarters was isolated from its command near Draguignan. Finally, defending troops were constantly harassed from the rear by the French Resistance Forces.

For the first three days after the landing, German defensive measures amounted to little more than guerilla warfare. Terrain opportunities were exploited to achieve a sort of checker-board system of isolated and uncoordinated defense with small groups attempting to install and maintain hastily built roadblocks in order to delay as long as possible the Allied advance.

Driving the Wedge

The initial momentum of the Allied assault carried the American combat units inland approximately ten miles and permitted

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

an expansion of the beachhead on either flank. Because of the mountainous terrain of the coastal area, the most logical entry into the interior was by way of the Argens River Valley. It is through this depression that Highway 7 runs from Frejus west to Aix-en-Provence and northwest toward Avignon. This route very soon became an important line of communication between the beachhead and the Rhone Valley.

A VI Corps field message dated 16 August set forth the general objectives and lines of advance of the three American Divisions. The 3rd Division was to seize and hold positions along the Real Martin River until relieved by the French II Corps and was then to continue its advance along Highway 7 toward the Rhone Delta. The 45th Division, after assembly at Le Luc, was to be prepared to advance to the northwest, north of the Maures Mountains. The 36th Division was to advance eastward in the direction of Cannes; but, as soon as the beachhead was secured, was to be prepared to thrust northward along the Route Napoleon (Highway 85). This field message also provided for flank security and indicated the general direction of advance. The lack of specific objectives indicates the anticipated rapidity of the advance inland and the early absence of strong enemy resistance.

To complete VI Corps plans for exploitation inland a provisional group known as Task Force Butler was assembled at Le Muy. General Truscott, Corps Commander, had indicated that first objectives of the force would probably be a crossing of the Durance River near Manosque or St. Paul, the holding of bridges, and a drive north to Grenoble or west to Montelimar. The newly-formed provisional group consisted of a headquarters, the 117th Reconnaissance Squadron, the 59th Armored Field Artillery Battalion, the 753rd Tank Battalion (less one Medium and one Light Tank Company), 2nd Battalion, 143rd Infantry, Company C, 636th Tank Destroyer Battalion, Company F, 344th Engineers, Company C, 111th Medical Battalion (plus a detachment from Clearing Company), 3426th Quartermaster Truck Company, and a detachment of the 87th Ordnance Heavy Maintenance Company.

The plan for Task Force Butler was actually conceived before the embarkation of assault troops from Naples. The Provisional Armored

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

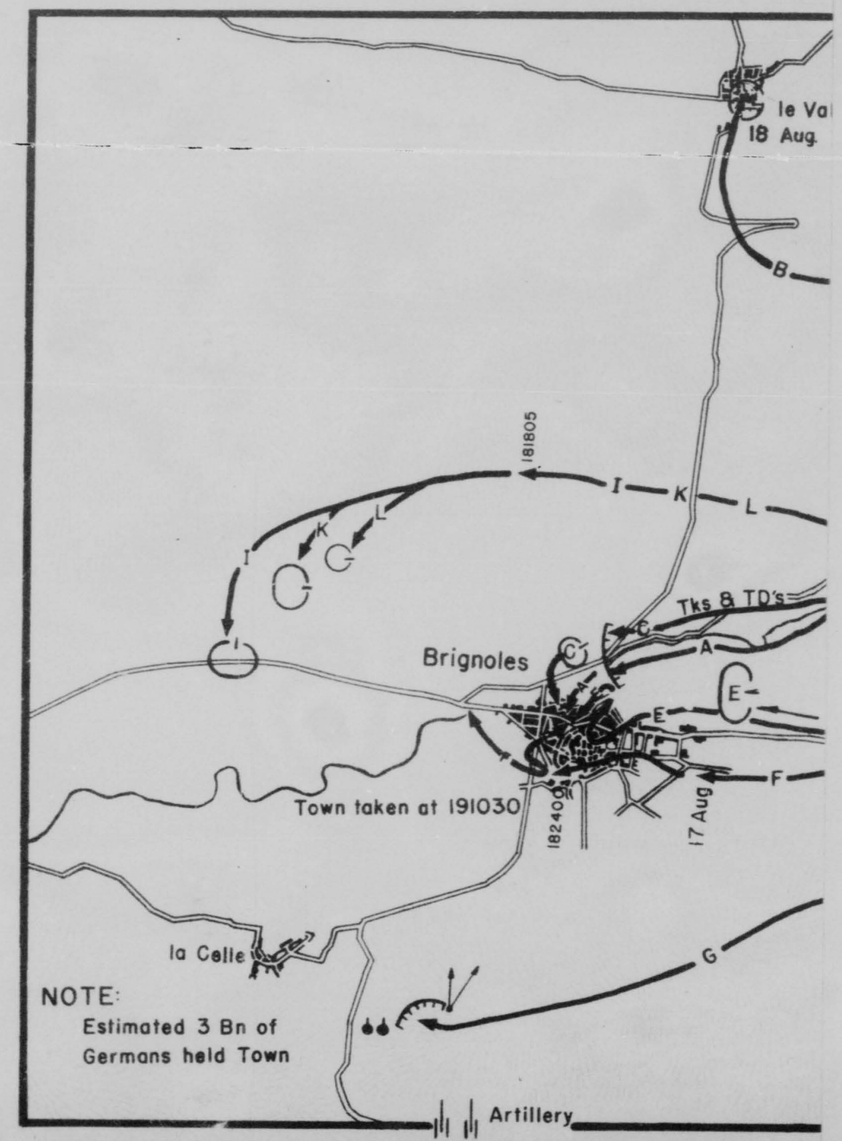
Group, as it was designated by VI Corps, was commanded by the Corps Deputy Commander, Brigadier General Frederick B. Butler, and made up of elements of the assault divisions and their attached units. In compliance with orders issued by the Commanding General of VI Corps, Task Force Butler moved out of its assembly area in the vicinity of Le Muy on the morning of 18 August in the direction of Riez.

The 15th and 30th Regiments of the 3rd Division moved westward along Highway 7 toward Brignoles; the 7th Infantry continued along the southern route, Highway 98, which connects St. Tropez with Toulon. The 1st and 2nd Battalions of the 30th Infantry came into an assembly area east of Brignoles during the night 17-18 August. At 0700 hours the following morning the attack jumped off. The 1st Battalion pushed the assault from the north side of town engaging the enemy throughout the day, the night and into the morning of the 19th. The 2nd Battalion attacked toward the south and center of Brignoles, and street fighting continued until enemy resistance was overcome during the morning of 19 August.

To prevent Toulon from being isolated from the north, the enemy fought stubbornly to hold up the advance of the 3rd Division at Brignoles. Virtually the whole 2nd Battalion of the German 757th Infantry Regiment was destroyed in this action.

The 15th and 30th Infantry Regiments now continued their rapid advance westward along the axis of Highway 7. The 7th Infantry, having completed its mission along the coast road, moved north to join the other regiments. During the 24 hours from noon on 19 August until noon on 20 August the 3rd Division, preceded by the 3rd Reconnaissance Troop, covered 30 miles by marching and by motor transport, against only slight enemy opposition. Near Aix-en-Provence leading elements of the Reconnaissance Troop ran into an enemy roadblock late in the morning of 20 August. The enemy strongpoint was made up of at least two antitank guns, two tanks, mortars, and infantry.

The enemy appeared to be preparing to make another defensive stand at Aix. Approaching the town the 30th Infantry encountered several roadblocks covered by adjusted artillery and mortar fire. After



THIS PAGE IS UNCLASSIFIED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

dark several enemy planes came over and dropped flares. The 2nd Battalion of the 30th Infantry took up a position southeast of the town while the 1st Battalion dismounted from its vehicles and moved northwest through hilly wooded country to the village of Les Logissons, north of Aix. Here it established a roadblock. Shortly afterwards the roadblock was attacked by a group of about 50 enemy bicyclists and fighting continued throughout the night of 20 August.

An all-out attack on Aix-en-Provence was ordered for 0600 the following morning and air support requested from the Seventh Army. The 1st Battalion having assembled to the northwest of Aix, attacked with two companies abreast and one company in reserve. The 2nd Battalion, having knocked out the enemy roadblock at La Galante by 1400 hours on 20 August, had moved up to occupy high ground in the southeastern suburbs of Aix. By 0600 on 21 August the 2nd Battalion was prepared to place mortar, tank destroyer, and automatic weapons fire on the town of Aix in support of the regimental attack.

The 3rd Battalion, supported by a detachment of the FFI, moved directly on the town from the northeast. The FFI Chef de Groupe drew sketches of enemy gun positions, strongpoints, and tank obstacles, and then assigned guides to each of the companies of the battalion. Companies L and K attacked abreast, met only sniper fire, and soon reached the Justice Hotel in the center of town. At 1030 hours the battalion commander was ordered to clean out the western half of Aix and contact the 1st Battalion. Apparently, the main body of the enemy had withdrawn during the previous night and had left behind only small groups to harass the Americans and delay their advance. The 2nd Battalion established a roadblock on the main route running south toward the coast, and the 1st and 3rd Battalions assembled and moved west along Highway 7.

The sector between the 3rd and 45th Infantry Divisions was taken over by Combat Command 1 of the 1st French Armored Division. It had landed over beaches in the St. Tropez-Ste. Maxime area and on D plus 1 moved west through Gonfaron, through Flassans, and north along Road 130 to reach Cabasse. In protecting the northern flank of the beachhead Combat Command 1 encountered heavy antiaircraft,

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

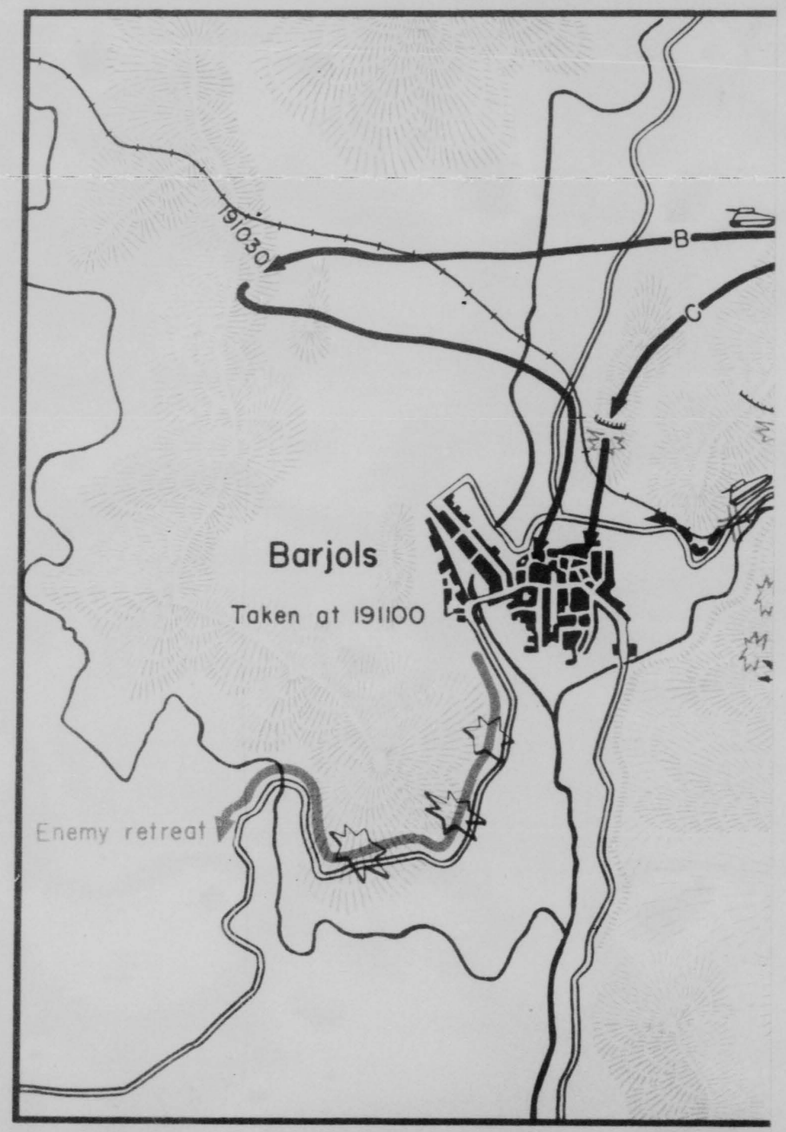
THIS PAGE IS UNCLASSIFIED

artillery, and small arms fire between Cabasse and Carces. After a stiff fight on 18 August enemy resistance was wiped out, and several artillery pieces and numerous prisoners were captured. When the armored forces had reached Carces they swung southwest on Route 562 and arrived at Le Val where they regrouped.

In the center of the assault area, the 45th Division, consisting of the 157th, 179th, and 180th Infantry Regiments, moved northwest. The enemy offered little resistance until the 179th Infantry reached Barjols. This town was an important road junction controlling routes northward to the Durance River Valley. Here the Germans put up determined resistance. The 1st Battalion with Company I attached, attacked toward the town the afternoon of 18 August; but by nightfall the enemy still held positions in defense of Barjols. However, during the next afternoon Barjols was cleared and the 179th Regiment went on to Rians.

The 45th Division was now rapidly approaching the Durance River in the vicinity of St. Paul. When elements of the 157th Infantry arrived at the river they found the bridge only partially destroyed. Foot troops went over while the engineers worked with utmost speed to construct a vehicular crossing farther east. Little opposition was encountered on the north bank, as troops of the 2nd Battalion, 157th Infantry, advanced north and west to capture Mirabeau and Pertuis. On the south bank the 1st Battalion, 180th Infantry, moved to the west on Route 561 and ran into small arms and medium artillery fire near Peyrolles. The advance continued, however, throughout 20 August through Peyrolles and Meyrargues.

Spearheading the American advance inland was Task Force Butler, which had moved out of its assembly area at Le Muy on the morning of 18 August. The main body of the Task Force pushed along the axis Draguignan to Salernes to Riez. On the east flank reconaissance troops passing through 36th Division units on the road north of Draguignan toward Castellane met enemy resistance almost immediately. In this area the German LXII Corps Headquarters had been engaged by airborne troops and the 36th Division when elements of Task Force Butler arrived. The enemy Corps Headquarters was captured, including



THIS PAGE IS UNCLASSIFIED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

the Commanding General, Lieutenant General Ferdinand Neuling, and about 400 officers and men. The enemy, however, continued to delay the advance north. The right flank column of Task Force Butler was ordered to slide-slip to the west and join the main body, leaving 36th Division troops in positions north of Draguignan. Task Force Butler closed in at Riez during the night 18-19 August.

While this mobile column was approaching the Durance River, well forward of the main VI Corps front, two or three battalions of the German 157th Reserve Division moved down the Grenoble Corridor from the north and were approaching Digne. General Butler saw an opportunity to encircle the enemy at Digne by a flanking maneuver and a surprise attack. One reconnaissance detachment left the main column. It turned to the northeast toward Mezel and Digne and reached Chateauredon on the Route Napoleon before meeting the enemy. The German defenders of Chateauredon surrendered without a fight. A larger detachment of Task Force Butler, consisting of one company of infantry supported by medium tanks, left Oraison to follow the east bank of the Durance River to Malijai. Here enemy resistance was weak and brief, and the detachment continued eastward along the Route Napoleon to approach Digne from the west. The German garrison in Digne, blocked from the south and west on the main highway, surrendered at 2000 hours on 19 August. About 600 prisoners were taken, including Brigadier General Hans Schuberth of Feldkommandatur 792.

The main body of Task Force Butler, having moved out of Oraison, crossed the Durance River and proceeded up the west bank along Highway 96. Arriving at Sisteron late in the afternoon of 19 August, General Butler established his command post and sent reconnaissance elements to outpost the area to the north. Information was received that additional elements of the German 157th Reserve Division were moving southward from Grenoble and that an enemy force had already occupied Gap. The Provisional Armored Group awaited orders from VI Corps and assembled to the northwest of Sisteron. There the main body was joined by the two detachments which had cleared the enemy from Digne.

Since there were two alternate routes between Sisteron and

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Grenoble, a new tactical situation developed. The main column, preceded by reconnaissance forces, continued northward through Aspres to seize and hold Col de la Croix Haute, a mountain pass on Highway 75. This move blocked the western highway against German elements coming down from Grenoble. A second column swung east from Aspres and, supported by French Resistance Groups in considerable strength, attacked the town of Gap on the afternoon of 20 August. After a brief engagement the enemy surrendered 1,000 prisoners, a large ration dump, and a demolition supply dump. Thus, by blocking the Col de la Croix Haute and capturing Gap, Task Force Butler effectively checked German movement southward from Grenoble toward the beachhead.

On the VI Corps right flank the 36th Infantry Division had advanced from Frejus and St. Raphael northwest to Le Muy and had spread out eastward into the foothills of the maritime Alps. Near Le Muy the 142nd Infantry had made contact with the 1st Airborne Task Force by 17 August and moved through Trans-en-Provence to Draguignan. On the division's eastern flank the 141st Infantry spread out to take over additional road blocks established by the 143rd Infantry, which was relieved on 18 August and began movement to Draguignan, the divisional assembly area.

On 18 August Task Force Eitt, made up of two infantry companies of the 141st Regiment, moved to the north of attack Callian, three miles east of Fayence. In Callian, French partisans reinforced a garrison of paratroopers, including 15 wounded, who had been trapped and surrounded by the enemy. Fighting continued throughout 19 August. The town changed hands twice before it was finally cleared of German machine gun and small arms fire. However, there was little enemy activity along the rest of the front held by the 141st Infantry, which maintained defensive positions on the eastern flank until relieved by the 1st Airborne Task Force on 20 August. The enemy forces in this sector had become isolated from the main body of the German Nineteenth Army. They were already preoccupied with the details of their withdrawal to the Italian frontier.

The Corps right flank was secured. The 36th Infantry Division now began a general movement to the northwest. The 143rd Infantry,

preceded by tank destroyers, moved from Draguignan to Sisteron where the regiment made contact with Task Force Butler and halted temporarily to await further orders. The 142nd Infantry moved to Castellane and prepared to continue northwest; the 141st assembled in the vicinity of Draguignan.

In the first five days of invasion, beachhead forces had penetrated inland against relatively little opposition. Preliminary defensive lines established by the German forces had broken. This breach, coupled with the lack of suitably disposed reserves with which to close the gap, had two far reaching results. First, the German 148th

PURSUING THE ENEMY FROM BRIGNOLES

". . . Preliminary defensive lines established by the German forces had broken . . ."

Reserve Division was now cut off from the rest of the Nineteenth Army; and, though it continued to fight delaying actions eastward toward the Italian frontier, it was never again able to take part in a coordinated action. Second, with an exposed left flank the Nineteenth Army was

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

unable to prevent an Allied exploitation inland with its attendant threat to the Rhone Valley.

By 20 August French Army B, having moved west along the coast, was now approaching Toulon and Marseille. The American 3rd Division had captured Brignoles, and moved up to Aix-en-Provence along Highway 7, forcing open this route to the Rhone Delta. The 45th Division had penetrated to the northwest to occupy Barjols in their approach to the Durance River. The 36th Division had advanced along the Argens River Valley through the Esterel chain of mountains, and had secured the right flank of the beachhead by pushing the German defenders toward the Italian frontier. Finally, Task Force Butler by occupying Digne, Sisteron, and Gap had severed German communications in the Grenoble Corridor and had opened the way for a rapid advance north to Grenoble or west to the Rhone River and Montelimar.

The Rhone Triangle

The Rhone River in its southward course towards the Mediterranean forms a triangular alluvial delta with its apex at Avignon and the two base points at Montpellier to the west and Aix-en-Provence to the east. Because of the nature of the terrain and the existing road nets, military traffic from the coastal area of southern France, both to the east and to the west of the Rhone River, must pass through the area of this triangle by way of two of the three cities. The lower Durance River Valley parallels the eastern side of the Rhone Triangle and creates a narrow corridor between two hill masses. From Aix to Avignon, Highway 7 passes through this defile which offered the enemy excellent terrain for delaying tactics to defend the eastern leg of the Rhone Triangle.

A Seventh Army field order of 19 August instructed the American VI Corps to seize and secure Aix-en-Provence. At the same time French Army B was to relieve all American troops south of Highway 7 and continue west to capture Toulon and Marseille. The capture of Aix would break the enemy's chief route of communications between the Rhone Triangle and the two Mediterranean ports. The Germans, consequently, moved several battle groups forward to block the progress

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

of the 3rd Division. This strategy was executed by stubborn delaying actions fought at both Brignoles and Aix.

Prior to 15 August the German 11th Panzer Division had been stationed near Bordeaux on the Atlantic coast. As soon as the German High Command was fairly certain that the Allied attack would come against the Mediterranean coast and not the Atlantic, it ordered the 11th Panzer Division to the southeast. It was to move through the Toulouse-Carcassonne-Narbonne Corridor so as to appear in the German order of battle in southern France. On 15 and 16 August air reconnaissance revealed that the entire division, loaded on 33 trains, was moving eastward toward the Rhone. This rail movement, according to subsequent reports, was stranded by tactical bombing. Personnel and equipment were forced to detrain and make their way toward the Rhone Triangle by division transportation.

Captured enemy field orders revealed that the tactical mission of the 11th Panzer Division was two-fold. First, it was to hold the east side of the Rhone Triangle along Highway 7 against the westward advance of the American 3rd Division. This would permit the bulk of the four less mobile German Divisions to withdraw along the western leg of the triangle between Montpellier and Avignon and northward up the Rhone Valley. Second, the 11th Panzer Division was to act as an escort for German units in their retreat northward up the Rhone Valley. Between Aix-en-Provence and Avignon, the 3rd Division encountered tanks of the 11th Panzer Division working in small groups supported by infantry.

Contact with the German Panzer Division seriously suggested the threat of an armored counterattack. At noon on 21 August General Truscott issued orders to halt the main body of the 3rd Division. Only reconnaissance elements were to be sent beyond the line Le Puy-Rognac until the strength of the opposing German armor could be determined. Shortly afterwards the advance was continued beyond, but it was four days later before the 7th Infantry arrived at Avignon. For the first time since D-Day the enemy on the VI Corps left flank began destroying bridges behind them. This was an indication that the delaying mission had now been completed.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

Enemy Withdrawal Up the Rhone Valey

From Avignon to Lyon the Rhone Valley traverses a distance of 133 miles running almost straight and nearly due north. The river divides the Central Massif on the west bank from the Alps du Dauphine on the east. On the western bank water courses have created severely defiladed avenues of communication. From Avignon to Orange the Rhone forms a broad, dry, sandy, loam plain suitable for military maneuver. North of Orange the river enters a 2,400-yard-wide corridor for a distance of five miles and then broadens out again until it approaches the Donzere Gorge, where its point of minimum defilade is only a quarter of a mile wide. The valley opens up into the plain of Montelimar for a distance of some ten miles and then is again constricted by Cruas Gorge, or the "Gate of Montelimar". With exception of the 22 mile Valence Plain immediately north of the Gate of Montelimar, the Rhone Valley's northward course to Lyon is generally narrow with defiladed walls.

A highway flanks each side of the Rhone River from Avignon to Lyon. On the east bank, Highway 7 is the best constructed and the most suitable for military traffic. On the west side of the river, Highway 86 covers the same distance but passes through more mountainous country. A highway running from Nimes, through Le Puy to Lyon was available as an evacuation route for German divisions in southwest France; but this road runs through the Massif Central and follows a winding course which is over 100 miles longer than either of the other two roads.

The German High Command issued five field orders covering the period 20-24 August. These were to govern the strategy of withdrawal of the German Nineteenth Army. A few days later the orders were captured in the vicinity of Savasse.

Field Order No. 1, dated 20 August, directed all elements east of the Rhone Triangle and south of the Durance River to assemble in the vicinity of L'Isle sur la Sorgue located on Route 100. This town, protected by favorable defensive terrain, was considered a convenient zone for reorganizing various German elements split up by the rapid

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Allied advances. All marches were to be made at night. Rear guards, equipped with heavy weapons and demolitions, were to be left behind to destroy bridges and other installations of value. Finally, the individual soldier was to "fight cunningly", and at the risk of a "mobile court-martial" was enjoined against looting and from wandering about unarmed.

The second captured field order, dated 21 August, was concerned with the retention of the Rhone Triangle for purposes of covering the retreat. Phase line "C" was set up as a tentative main line of resistance to be held until at least 23 August. An armored group from the 11th Panzer Division was ordered to remain in front of the phase line in order to prevent a "surprise" penetration by the American 3rd Division from the southeast. The main line of resistance was to be defended by the German 338th Infantry Division. Decisive importance was given to the defense of the town of Orgon. Its early capture by the Americans would prevent the reorganization of the German forces taking place farther north at L'Isle sur la Sorgue.

Arles was also to be strongly defended. It was located on the main route which ran along the base of the Rhone Triangle and connected Montpellier with Aix-en-Provence; now that Toulon and Marseille had been encircled, there was increasing danger that the American 3rd Infantry Division might push on toward the Rhone along the north shore of the Etang de Berre. Allied bombing had destroyed the bridge across the Rhone River at Arles. The Germans then established a ferry shuttle service with the view of evacuating elements in the coastal zone west of the Rhone Delta. This ferry service was to be maintained at all costs until 23 August.

The third German field order, also issued on 21 August was the authority for the withdrawal northward up the Rhone Valley. The Allied bridgehead in northern France had expanded rapidly and so, threatened to completely sever German lines of communication with home bases east of the Rhine. The Nineteenth Army, therefore, was ordered to "disengage itself from the enemy" and join the southern wing of German Army Group "B" which was operating in northern and central France.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

A new phase line was set up behind which the divisions would reorganize for the retreat. The line began at Sommieres on the left side of the Rhone Triangle and continued as an arc to include Arles, Orgon, and terminated at Apt, which was considerably more extensive than the phase line delineated in the previous field order. Apparently, the German Army hoped to protect the escape route of the three divisions west of the Rhone River and to collect the disorganized elements, active in battle, to the east and southeast of the phase line. The 11th Panzer Division was ordered to assume the role of the chief maneuvering element of the retreating forces. It was to lead the withdrawal up the Rhone Valley and block all entrances to Highway 7.

The first specific objective of the retreat was the confluence of the Drome and the Rhone Rivers south of Valence. Delaying actions were to be fought whenever necessary, but the main emphasis was to be placed on keeping open the escape route. Marseille and Toulon were to be defended "to the last man . . . . according to an order of the Fuehrer."

On 23 August the German High Command issued its fourth field order which included instructions for the execution of the disengaging movement. In leading the withdrawal, the 11th Panzer Division was ordered to pull out all its elements operating in the Rhone Triangle, continue northward along Highway 7 through the Gate of Montelimar, and ward off the blocking movements of the American 36th Infantry Division and Task Force Butler to the northeast of Montelimar. The German 198th Infantry Division was to follow the 11th Panzer Division by forced marches and render assistance in breaking through the American blocking force.

The fifth captured German field order, which covered the last phase of the withdrawal from the Rhone Triangle to the Gate of Montelimar, was issued on 24 August. The protection of the rear of the column was left to the German 338th Infantry Division as far north as phase line "E" at a point where the Eygues River flows into the Rhone. Here Highway 7 leaves the plain of Orange and enters a narrow defile which gave a certain flank protection to the retreating forces. The movement of the German 338th Division suggested that the last of the slower German elements had now evacuated the lower Rhone Valley

and were endeavoring to push on past the Americans who were occupying the high ground northeast of Montelimar.

Enemy Motor and Rail Movement

Reconnaissance flights of the XII Tactical Air Command discovered the pattern of enemy traffic throughout the Rhone Valley. During the first six days after D-Day German rail and motor movement was in accordance with the tactical situation. Immediately after the Seventh Army landings enemy divisions west of the Rhone Delta began a movement eastward toward the assault beaches. In the Rhone Valley the preponderance of both motor and rail traffic was southward from Lyon. From Grenoble traffic moved south through the corridor toward the invasion coast. Immediately after D-Day the German intention seems to have been to reinforce the troops along the beachhead, or perhaps, to build up reserves in the lower Rhone Valley for a major counterthrust.

By 21 August, however, the direction-pattern of enemy traffic was reversed. There was no longer any movement from west of the Rhone toward the assault area. Both rail and motor convoys were now observed turning northward up the Rhone Valley at Avignon.

The route to Lyon along the western bank of the river was being used to capacity. This increased traffic along a less desirable military route indicated that the enemy was becoming increasingly concerned over the rapid thrust of the 3rd Infantry Division along Highway 7. Included in this northbound exodus were fuel, ammunition, and general supply trains, both motor-driven and horse-drawn, along with artillery and personnel. The enemy also made maximum use of the railroads on both sides of the Rhone River, although tactical bombing considerably hampered rail movement. Ferry services across the Rhone were kept in operation north of Avignon, and troops were transferred to the east bank whenever it was possible.

Air reconnaissance reported that each large group of motor trucks was preceded by from two to ten tanks, presumably from the 11th Panzer Division, acting as a mobile escort. The shortage of motor fuel

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED.

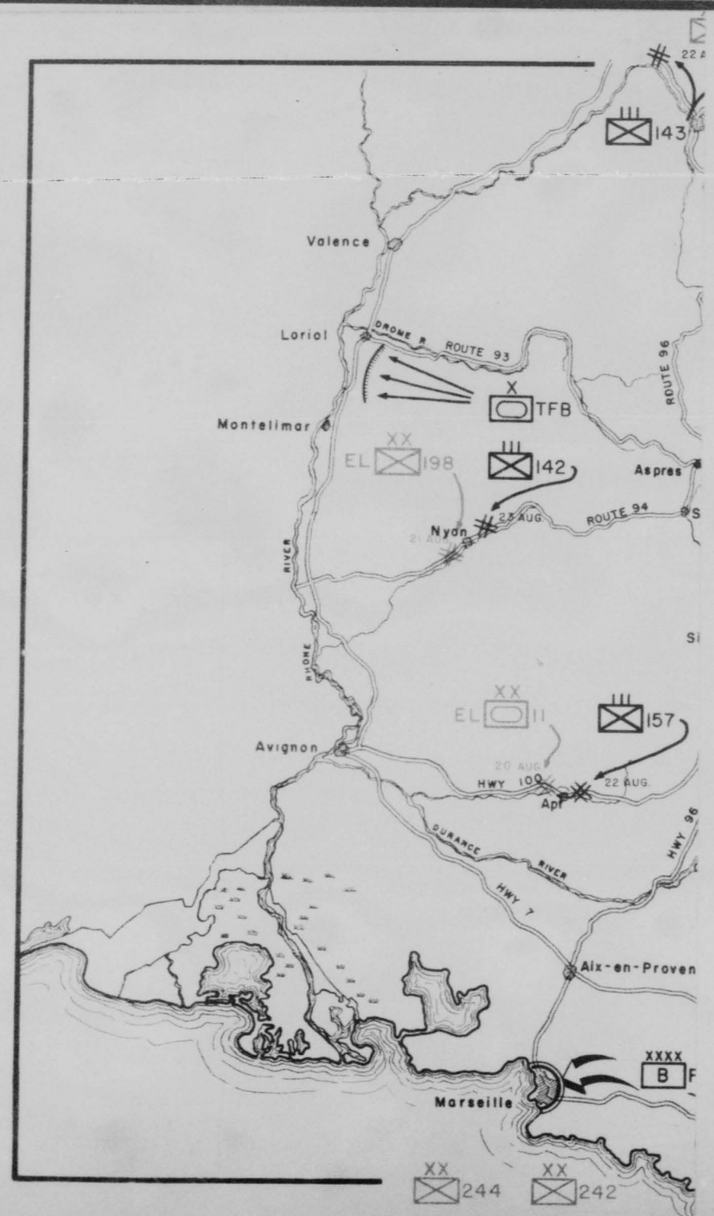
was critical and many troops were observed being towed on bicycles. Several bicycles were spaced at intervals along a tow rope which was attached to a troop carrier.

The pressure applied by Task Force Butler against enemy traffic in the Gate of Montelimar was reflected farther south. On 24 August reconnaissance reports stated that south of Montelimar there was heavy movement, both road and rail, along the east and west banks of the Rhone River; but from Loriol north to Lyon movement was almost non-existent. This absence of traffic implied a complete interdiction by Task Force Butler and elements of the 36th Infantry

ENORMOUS SPAN BRIDGE DESTROYED BY THE ENEMY AT CAVAILLON
". . . Cavaillon was occupied by the 3rd Division without enemy contact . . ."

Division. Either the Rhone Valley was completely blocked, or the enemy had temporarily halted all his convoys until the 11th Panzer Division could break through and lead the slower elements out of the trap.

The northwestward thrust of the 3rd Division toward the



THIS PAGE IS UNCLASSIFIED

Rhone River tended to accelerate German withdrawal in the direction of Lyon. The 15th and 30th Infantry Regiments actively patrolled against elements of the German 338th Infantry and 11th Panzer Divisions to the northwest of Aix. The 7th Infantry moved steadily forward along Highway 7. Reconnaissance troops, sent out as patrols on both sides of the Etang de Berre, occupied the town of Martigues, from which the enemy had withdrawn. Forward elements had reached the Rhone River at Arles by 24 August. The 3rd Infantry Division moved north across the Durance River and on the 25th occupied Avignon, Orgon, and Cavaillon without enemy contact.

Five of the eight enemy divisions operating along the coast of southern France had reached Montelimar by 27 August. Led by the 11th Panzer Division, the 198th, 716th, 189th, and 338th Infantry Divisions joined in the northbound retreat. The two remaining divisions west of the target area, the 242nd and the 244th, were hopelessly encircled in Toulon and Marseille. They ultimately surrendered to French Army B. The 148th Reserve Division in the Cannes-Nice area and the 157th Reserve Division at Grenoble sought refuge by passing through the Alps toward Italy.

The Grenoble Corridor

The principal route of communication between the coastal area of southern France and the area north of the Isere River Valley is by way of the so-called Grenoble Corridor. This natural entrance into east-central France runs almost due north from the coast and lies about midway between the Rhone River and the Italian Frontier.

The Grenoble Corridor is approached from the south by two principal highways, Route 96, which originates at Aix-en-Provence and runs northeast paralleling the Durance River, and the Route Napoleon (Highway 85), which begins at Nice and follows a northwestward course through the Provence Alps. At Valonne, Highway 96 joins the Route Napoleon and continues on through defiladed terrain to Sisteron. Here the road divides again. One branch passes through Serres and Aspres; the other passes through the town of Gap. At Pont-de-Claix the

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

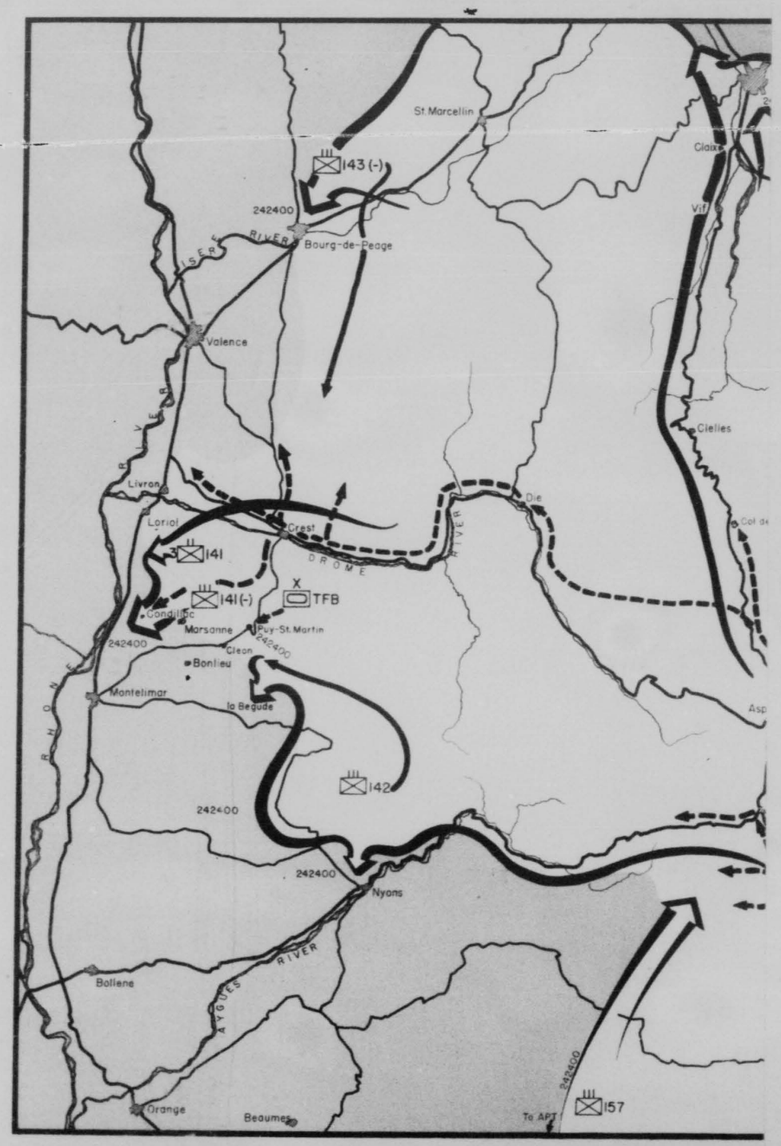
THIS PAGE IS UNCLASSIFIED

two roads again join and proceed on to Grenoble. Several routes connect the Grenoble Corridor with the Rhone Valley to the west and with Alpine Passes to the east. At Aspres Route 93 follows the Drome River westward to its confluence with the Rhone north of Loriol; Highway 94 is an alternate east-west route from Serres to Pont-St. Esprit, halfway between Avignon and Montelimar.

A Seventh Army field order, dated 19 August, directed that elements of the American VI Corps reconnoiter in force to Digne and Castellane, secure Sisteron and crossings over the Durance River. One division was to be on the alert for an advance to Grenoble. The field order further provided that the 1st Airborne Task Force would relieve elements of the 36th Division on the VI Corps right flank and assigned it a zone of responsibility along a general line from Fayence to La Napoule. This general defensive line originated on the coast west of Cannes and was later extended northward to include Larche Pass on the Italian frontier. The Seventh Army thus provided for the penetration of the Grenoble Corridor in depth. The Commanding General of the VI Corps had ordered Task Force Butler to spearhead the advance. This move was to be followed in close tactical support by the 36th and 45th Infantry Divisions.

As early as 20 August General Truscott, Commander of VI Corps, considered the possibility of moving Task Force Butler west to the vicinity of Montelimar. The FFI were reported to be well organized on both sides of the Rhone River and were expected to be of great assistance in any attempt to block enemy movement in the Rhone Valley. On the evening of the 20th, instructions were sent to General Butler "to put out reconnaissance forces on the road nets to the north and west, examining the possibility of advancing to the vicinity of Montelimar; to block enemy forces withdrawing up the Rhone Valley from the south; and also be prepared to continue the advance to Grenoble." At 2045 hours another message was sent from VI Corps: "You will move at first light 21 August with all possible speed to Montelimar. Block all routes of withdrawal up Rhone Valley in that vicinity. 36th Division follows you."

General Butler ordered one troop of the 117th Reconnaissance



THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Squadron (reinforced) to send out patrols and to establish a roadblock north of Gap. Other elements of the troops were to push north up the Montmaur-St. Disdier road. One reconnaissance platoon and one battery of the 59th Armored Field Artillery were to remain near Col de la Croix Haute to block the road at this point and to reconnoiter toward Monestier. These forces were to remain in position until relieved by elements of the 36th Division.

On the morning of 21 August those elements of Task Force Butler which had established a roadblock on the Route Napoleon at Col Bayard north of Gap were attacked. The enemy force, estimated at two battalions, had moved southeast from La Mure during the previous night. After a short fire fight this attack was successfully repulsed. To the west on the alternate route to Grenoble, Monestier was reported cleared of the enemy, but north of Monestier fighting flared up at Vif between a small enemy force and the FFI.

The main body of Task Force Butler, preceded by reconnaissance units, moved westward from the Grenoble Corridor and followed Highway 93 along the valley of the Drome River. By dusk on 21 August reconnaissance elements had entered the Rhone Valley. Throughout this rapid advance no contact was made with the enemy until a German convoy of approximately 30 vehicles was observed moving north out of Livron. The advance troops of Task Force Butler attacked and destroyed the vehicles, killing and wounding several of the enemy. Eleven prisoners from a Russian labor battalion were taken.

Again there was no further contact with the enemy until reconnaissance patrols attempted to cut Highway 7 west of Condillac. At that point they were driven out by superior German forces. However, units of Task Force Butler pushed on to within a few miles of Montelimar where they occupied high ground overlooking the valley below. General Butler established his command post at Marsanne.

As Task Force Butler moved toward the Rhone Valley, the 36th Division crossed the Durance and continued north toward Grenoble. The 141st and 142nd Infantry Regiments, by means of shuttles, moved into Aspres and Gap and relieved elements of Task Force Butler at

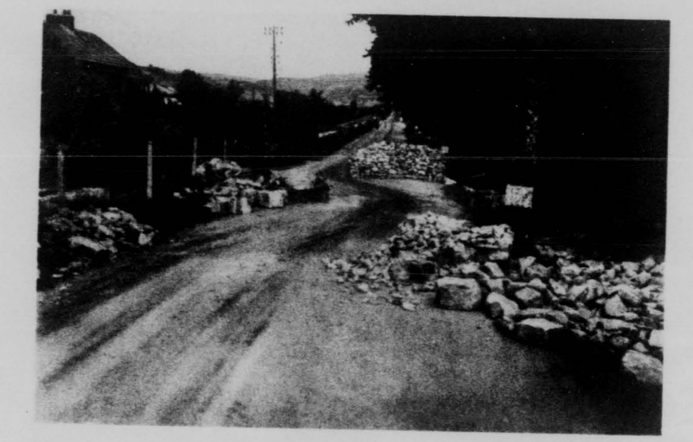
THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

several roadblocks. The 143rd Infantry occupied Col de la Croix Haute and prepared to send troops north to Grenoble.



Throughout 22 August the 36th Division fanned out north, west, and east from the vicinity of Aspres against practically no opposition. The 3rd Battalion of the 143rd Infantry, moving rapidly north along Route 75, passed through Clelles, Monestier, Vif, and arrived at Pont de Claix. From this last town patrols entered Grenoble without opposition and occupied the city at 1400 hours on 22 August.

Almost immediately reconnaissance elements pushed on five or six miles north and northeast of Grenoble but made no contact with the enemy. The FFI were reported to be in control of all bridges north of the city, and the main route was thought to be cleared as far as Lyon. Later in the day the 1st Battalion of the 143rd Infantry arrived in Grenoble; it had liquidated an enemy pocket at Vizille and captured 30 prisoners.

The 142nd Infantry, 36th Division, continued to hold roadblocks north and east of Gap. New blocks were established in the vicinity of Guillestre, and patrols were sent out to reconnoiter Route 94 in the direction of Briancon, where the FFI reported the assembly of a large enemy force. At the same time the 141st Regimental Combat Team, supported by the 141st and the 977th Field Artillery Battalions, was to proceed west from Aspres, in accordance with orders from the Commanding General of VI Corps, with all possible speed to reinforce Task Force Butler in the Montelimar area. Movement began at 1430 hours on 22 August, and by midnight the two field artillery battalions were in position near Marsanne, prepared to fire missions across the Rhone River.

With the capture of Barjols on 19 August the 45th Infantry Division had opened the route to the lower Durance Valley. The Germans had demolished all the bridges in the division sector, and the crossing of the Durance River was marked more by physical inconvenience than actual enemy resistance. This crossing was also hampered by the swollen waters of the river. Heavy thunder showers in the Provence Alps had caused the Durance to rise more than three feet above its normal seasonal level. Division troops, nevertheless,

crossed to the north bank and spread out in two directions along the Durance. As the 180th Infantry Regiment moved downstream toward Avignon, the 179th Infantry turned upstream toward Volonne. The 157th Infantry, in the division center, crossed the Luberon Mountains

BLASTED GERMAN ROADBLOCK
". . . Highway 100 at Apt . . ."

along Highway 543 to reach the road junction with Highway 100 at Apt. About 100 of the enemy in Apt put up a brief fire fight. The 1st Battalion of the 157th Infantry, supported by a considerable number of FFI, attacked the town from three directions. All resistance was overcome by 1520 hours on 22 August. At Apt strong roadblocks were established against elements of the 11th Panzer Division. The Germans were operating east of Avignon on Route 100 in an effort to protect the eastern side of the Rhone Triangle.

The other two regiments of the 45th Division encountered little enemy opposition. The 180th received some small arms fire in and

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

about Rognes, but as they moved in to occupy the town the enemy withdrew. Only cautious and slow advances were made as two battalions were alerted to move to the vicinity of Aspres. The 179th Regiment was relieved of roadblocks along the Durance at Rians, Forcalquier, and St. Aubon and was ordered to an assembly area in the vicinity of Grenoble. Upon arrival it was attached to the 36th Division.

CHAPTER IX

The Battle of Montelimar

THERE is no doubt that topography was destined to play an important role in the battle of Montelimar. South of the town and east of the Rhone a broad plain extends for seven miles. Here the enemy was expected to

MONTELIMAR — TAKEN FROM THE SOUTH
". . . Montelimar is a key communications center . . ."

organize and to concentrate his forces before entering the battle area proper. Montelimar is a key communications center. Highway 7 runs north and south through the town; two roads branch out to the west to

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

cross the Rhone River; two others lead to the east toward Nyons and Crest. The inability of the American forces to seize and hold Montelimar during the early stages of the battle made it necessary for them to control the hill masses northeast of the town in order to prevent the Germans from moving north along Highway 7 and east along the Roubion River Plain.

Two tributaries flow into the Rhone River from the east at points almost midway between the city of Lyon and the Mediterranean. The Drome, the larger and more northerly of the two streams, empties into the Rhone some four or five miles west of the towns of Livron and Loriol. The Roubion River, the smaller and more southerly tributary, discharges into the Rhone about two and a half miles southwest of Montelimar. Fifteen or 20 miles inland from the east bank of the Rhone are the foothills of the French Pre-Alps. This area of less than 250 square miles, is bounded on the west by the Rhone River, on the north by the Drome River, on the east by the foothills of the Pre-Alps, and on the south by the Roubion River. This terrain, roughly a square, with Montelimar, Charols, Crest, and Livron at its four points, was the setting for the eight day Battle of Montelimar.

The Rhone River, western border of the quadrangle, is characterized chiefly by steep banks as it passes through the battle area. Seven miles south of Montelimar is the Donzere Gorge, two miles long and only 440 yards wide. Northward from this gorge the Rhone Valley opens up into the Plain of Montelimar. This plain is "T" shaped, extending northward along the Rhone Valley for ten miles, and eastward along the Roubion Valley for 12 miles, where it reaches the foothills of the Pre-Alps. Three miles north of Montelimar the Rhone Valley enters another defile, the Cruas Gorge or the Gate of Montelimar. As the Rhone Valley continues northward for the next ten miles, the maximum width is not over one mile. On the western side of the valley cliffs rise to a height of 1,600 feet, and on the east is the heavily forested area of the Marsanne. Here the Rhone Valley widens to admit the Drome River and to enter the southern part of the plain of Valence.

The Drome River, northern border of the battle square, creates a small alluvial valley, approximately two miles wide and originating

at Crest. During low water periods it is possible to establish fording sites along the lower reaches of the Drome River.

Three hill masses north of Montelimar are the key to the control of the town and the highways running north and east of it. The largest, but not the highest, of these hill formations is Ridge 300 (389-290: represents altitude in meters), which is about two and one half miles north and a little east of Montelimar. This ridge descends to the north rather gradually toward the village of La Coucourde. The second and smallest of the three hill masses is Hill 294, (represents altitude in meters). Oval shaped and scarcely over a half mile long through its major axis, Hill 294 is northwest of Montelimar and just southeast of Ridge 300. The highest of these hill masses north of Montelimar is Hill 430 (represents altitude in meters). Nearly circular, with a diameter of almost a mile at its base, Hill 430 lies approximately one quarter of a mile northeast of Hill 294, and less than a mile east of the northern portion of Ridge 300.

A hostile force in control of Montelimar possesses various alternatives for moving its men and equipment northward toward Lyon. It may move directly up Highway 7, or it may turn eastward at Montelimar to move through the battle quadrangle by means of several secondary routes. In any case, the enemy would be forced to cross the Drome River, since the foothills prevent any large scale military movement eastward.

In order to keep the enemy from reaching Lyon, the following was necessary: 1) Effective blocking of Highway 7. 2) Prevention of enemy movement through the battle area east of Highway 7 and west of the foothills of the Pre-Alps. 3) Complete control of the Drome River, including possession of bridges and fording sites. Highway 7 could be blocked by the installation of physical road barriers, artillery fire, or by the complementary use of both. Since the Marsanne forest parallels Highway 7 from Montelimar to Loriol, the exact location of roadblocks placed on the highway and of artillery emplaced in the Marsanne forested hills would be directed by the tactical situation.

To prevent the enemy from moving through the battle area east of Montelimar it would be necessary to control the alluvial plain

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

of the lower Roubion River Valley. To keep the enemy from crossing the Roubion north into the battle square, it would be necessary to blow bridges, to defend the river line, and to hold the towns of Marsanne, Puy St. Martin, and Cleon to the north. To prevent movement east along the Roubion, the only method was to block his forces with infantry and artillery.

Preparations For Battle

As late as 20 August it had not been decided whether Task Force Butler should continue to advance north toward Grenoble, or turn west to the Rhone Valley where a new tactical situation seemed to be developing. The FFI had recommended to the Commanding General of Task Force Butler that he continue on to Grenoble, since in their opinion French Resistance Groups were already in control of the Rhone Valley. However, at a Seventh Army conference, held on 21 August, it was decided to send Task Force Butler to the west to occupy the high ground northeast of Montelimar.

When this order was issued, Task Force Butler was about 30 miles south of the city of Grenoble. Advance elements of the force left the Grenoble Corridor and moved west to Highway 93, passing through Die and Crest. These elements arrived in the battle area at 1700 hours on 21 August. The precipitous German withdrawal up the Rhone Valley had not yet begun.

Task Force Butler had moved into the battle area along its northern border, the Drome River. The main route of supply and communication with rear supply dumps was Highway 93, which ran east to the Grenoble Corridor. Contact had been made with the enemy in the Rhone Valley.

While Task Force Butler was awaiting the arrival of reinforcements from the Grenoble area, German tanks were known to be holding critical terrain features in the battle zone. These tanks apparently were also awaiting reinforcements from the south, since no willingness was shown for an open engagement. Both sides were marking time.

The rapid advance of Task Force Butler northward up the

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Grenoble Corridor had been followed by the American 36th Division. As early as 20 August the possibility of a change in the axis of advance of the 36th Division became apparent. At 1815 hours on 21 August the Commanding General of the American VI Corps issued this brief order to the 36th Division. "Re-enforce Butler with one infantry regiment and the bulk of your long-tom and M-1 battalions. Blocking the Rhone Valley is your primary mission." This order was further implemented by later directives stating that, "The 141st Infantry Regiment is to re-enforce Butler at once . . . . Speed is essential."

The 2nd Battalion of the 141st Infantry moved out from Aspres on 22 August on its newly assigned mission, closed in at Crest by 0230 the following morning, and moved south in preparation for an attack against Montelimar. The 1st Battalion arrived at Condillac, the new regimental command post six miles northeast of Montelimar, at 0930 hours on 23 August and went into position near the 2nd Battalion. The 3rd reached Condillac at 1300 hours and was to occupy high ground south of Livron. The 141st Regiment had gathered along the Rhone, occupying the main line of resistance from Montelimar on the south to the Drome River on the north.

General Truscott had further ordered the 36th Division to block roads on both sides of the Rhone Valley. "If humanly possible create road blocks", and he added, "you must interrupt all enemy traffic on the main north-south roads in the Rhone Valley." The mission of the 36th Division was clear and explicit. The American forces were to be built up at Montelimar in an effort to block the German retreat up the Rhone.

In preparation for coming operations, Task Force Butler had taken up defensive and flank positions to support the 141st Regiment. Flank protection was made the responsibility of the 117th Reconnaissance Squadron. It was of utmost importance that all enemy movement be canalized directly northward along Highway 7 to bring the enemy into the firing zone of the 141st Regiment, and to protect supply lines between the battle area and the Grenoble Corridor. The 117th Reconnaissance Squadron was to patrol the entire extent of the southern border of the battle quadrangle and the road running south from Crest. It was also

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

necessary to protect American troops operating within the battle area from enemy thrusts from the north. German troops were known to be located in and around Valence and Lyon, and it was feared that increased American pressure exerted at Montelimar might increase German efforts from the north to keep open the escape route. The 117th Reconnaissance Squadron was therefore directed to send out vigorous patrols to the north and northwest from Livron.

With Task Force Butler had come the attached 59th Armored Field Artillery Battalion, the first artillery unit to engage in operations at Montelimar. When Task Force Butler arrived in the battle area on 21 August, the Armored Field Artillery Battalion immediately set up its batteries along the Condillac pass, between the Marsanne Forest on the north and Hill 430 on the south. By occupation of the Condillac Pass, batteries could lay effective direct fire on Highway 7 to the northwest, on the Roubion River Valley to the southeast, and indirect fire over the three hill masses toward Montelimar.

The first test of strength between the German and American forces occured on the afternoon of 23 August. The 2nd Battalion of the 141st Infantry Regiment had been assigned the mission of attacking from the north and northeast to take Montelimar. This attack was to be supported by a platoon of tank destroyers and a platoon of tanks, but they did not arrive. The French Maquis, who were to assist in the attack, were quickly dispersed by the Germans. The only support remaining to the 2nd Battalion was that of the 59th Armored Field Artillery Battalion set up at Condillac Pass about eight or ten miles northeast of the tactical objective. The advance of the 2nd Battalion was halted by artillery fire from Montelimar and also from Hill 300 which was strongly held by the Germans.

The first test of strength was an American defeat. The Germans were building up their forces south of Montelimar, while the Americans were rushing reinforcements westward from the Grenoble Corridor. This early failure to capture Montelimar was to alter the pattern of the eight day battle. By maintaining possession of Montelimar the Germans retained liberty of movement in two directions. They were able to continue north along Highway 7, since they still

retained control of the high ground to the north of town, and they were able to turn eastward along the Roubion River where elements of American forces were merely deployed as flank protection. On the other hand, American artillery since 21 August had begun its destructive

IMMOBILIZED VEHICLES AND RAILWAY GUN

"... American artillery since 21 August had begun its destructive work along Highway 7 ..."

work along Highway 7; and the increasing debris of wrecked equipment caused by both artillery and air operations compelled the Germans to seek alternative routes.

On 22 August the 36th Division had been directed by the VI Corps to, "move the 977th and the 141th Field Artillery Battalions to positions from which they can cover Montelimar and routes south in the Rhone Valley." By the close of 23 August the two battalions were in position northeast of Montelimar. The 141st Field Artillery Battalion moved into the Condillac Pass southeast of the positions of the 59th Armored Field Artillery Battalion. The 977th Field Artillery Battalion

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

went into position northeast of the village of Marsanne. It was not until 24 August, however, that the full artillery strength of the 36th Division was massed and organized at Montelimar.

Failure to contain the enemy initially, however, later made

GERMAN WRECKAGE ALONG HIGHWAY 7

". . . increasing debris of wrecked equipment compelled the Germans to seek alternate routes . . ."

it necessary to engage him on three sides. Montelimar was not captured until the end of the battle period, although numerous assaults were made on the town. The movement of the American 3rd Division into Montelimar from the south marked the end of the battle. After the town was occupied, no additional German elements were able to move into the battle area. Those who remained consisted mostly of suicide squads attempting to delay the American advance while German units withdrew across the Drome River.

THIS PAGE IS UNCLASSIFIED

Roubion River Line

The initial failure to capture Montelimar necessitated the building up of American defenses along the Roubion River Line. If the German elements could be denied the alternative routes leading east, they would have to pass along Highway 7 and be subjected to heavy artillery and small arms fire. At 1400 hours on 24 August the 36th Division issued its operational instructions. The main line of resistance was to follow the northern bank of the Roubion River from the southern slope of Hill 300 on the west to the foothills of the Pre-Alps on the extreme east. Defenses faced south, from which direction it was presumed that the greatest enemy pressure would be exerted. Defensive forces consisted of the 141st and the 142nd Infantry Regiments, one company of the 111th Engineer Battalion, one company of the 636th Tank Destroyer Battalion, plus all the divisional artillery in support.

The extreme western end of the main line of resistance was to be used as a hinge-point from which the 141st Regiment was to make its thrusts in an attempt to cut Highway 7. As the line progressed eastward, it served to protect the southern entrance to the Condillac Pass. The chief military value of this pass was that it covered an approach to the village of La Coucourde in the Rhone Valley from the middle portion of the Roubion River Plain. Farther eastward, the main line of resistance passed through the village of Bonlieu, which divided the zone of responsibility between the 141st and 142nd Infantry Regiments. From Bonlieu the line continued eastward in the zone of the 142nd Regiment until it reached the Pre-Alps.

Artillery was in position along the ridge to the north of the Roubion Valley to supplement the defenses of the main line of resistance. The 141st Infantry Regiment on the right flank was supported by the 131st Field Artillery Battalion. The 59th Armored Field Artillery Battalion remained in position along the Condillac Pass; the 131st Field Artillery Battalion moved southeast of the 59th to protect the southeastern entrance of the Condillac Pass; and the 133rd Field Artillery Battalion arrived to center its emplacements around the village of Marsanne.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

The 142nd Infantry Regiment on the left flank was supported by the 132nd Field Artillery Battalion and the 93rd Field Artillery Battalion. The entire divisional main line of resistance was supported by the 977th, the 141st, and the 155th Field Artillery Battalions. The 977th and the 141st Battalions remained in their former positions, one northeast of Marsanne and the other south of the Condillac Pass. The 155th Battalion was stationed north of the 132nd Field Artillery Battalion's position so as to give supporting fire to the left flank of the divisional line.

The Operations Instructions enjoined the field artillery battalions to be, "prepared to place fire of at least one half of the artillery on roads in the Rhone Valley from Montelimar north . . . . and to cover route Bourdeaux-Crest with at least one half of the artillery." Bourdeaux is on Route 538 between Crest and Nyons. These instructions indicated that, although the primary mission of the artillery was to reinforce the main line of resistance along the Roubion, it was also to be ready to cover Highway 7 north of Montelimar with fire and to prevent any enemy penetration along the eastern border of the battle area, especially toward Crest, through which ran the divisional supply line.

Although hills to the north gave good artillery observation, the entire Roubion River Valley was excellent tank country. During this season the river was low; and the surrounding ground was firm and open, cut only here and there by hedges.

On 24 August a copy of the Operations Instructions of the 36th Division fell into the hands of the enemy. Not only were the Germans forewarned as to the steps being taken to trap them, but the attached overlay indicated that Bonlieu was the weak spot in the main line of resistance. The 36th Division was now too heavily committed to change its battle plans, and only later would it be known what use the enemy would make of his acquired information.

In front of the village of Bonlieu a composite company of the 111th Engineer Battalion was spread out along a line over 3,000 yards in length. This unit consisted of Company A, less one platoon, and one platoon from Company C with a provisional platoon from Headquarters

and Service Company. At 1600 hours on 25 August a German unit of company strength, supported by two tanks, launched an attack preceded by infiltration tactics against Bonlieu. Covered by fire from the tanks, infantry crossed the river and forced the engineers back several hundred yards. This original enemy success was followed by another assault which completely destroyed any defensive line which the engineers might hope to maintain. A battalion of German infantry, supported by six Mark VI tanks, attacked toward Marsanne and completely severed the Roubion defense line.

The 1st Battalion of the 143rd Infantry Regiment was ordered from near Marsanne into the gap. On the following day, 26 August, as the 1st Battalion of the 143rd Regiment moved in to close the western segment of the breakthrough, the 1st Battalion of the 142nd Regiment moved to the south-west from near Puy St. Martin to the defense of the threatened sector. Again the Germans attacked the defense line at Bonlieu. Lack of mortars, temporary absence of air support, and the unfavorable defensive terrain were largely responsible for German successes in breaking through the American lines. Large numbers of German personnel and quantities of equipment were able on 25-26 August to enter the battle square and head northward toward the Drome River.

The German breakthrough at Bonlieu had completely severed contact between the 141st Regiment on the west flank and the 142nd Regiment on the east. The composite company from the 111th Engineers had been relieved from the battered line late on 25 August. By the morning of 27 August the original main line of resistance had been restored by the 1st Battalion of the 143rd Infantry and the 1st Battalion of the 142nd Infantry, and the Germans had been stopped from using the Roubion River Valley as an alternate route to the Drome.

Two regiments of the German 198th Infantry Division were identified in the order of battle during operations against the Roubion River line during 25-26 August. On 25 August the 326th Infantry Regiment spearheaded the attack, and the 305th Infantry Regiment followed the next day. Six Mark VI tanks were apparently attached to each regiment, and so skillfully were these tanks camouflaged that the

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

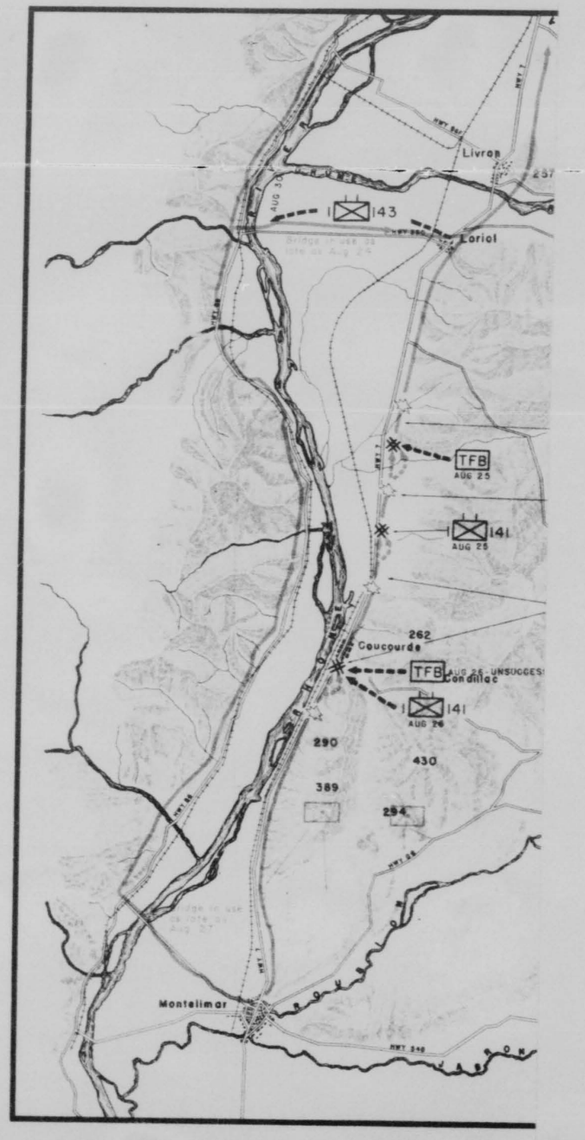
American artillery observers, along the ridges north of the river, experienced great difficulty in identifying the targets. Exactly what German elements slipped through the Bonlieu gap during the rupture of the American defensive line, it is impossible to establish. Interrogation of prisoners indicated that a part of the 11th Panzer Division and portions of the 198th Infantry Division availed themselves of this opportunity to escape.

Blocking of Highway 7

The blocking of Highway 7 was one of the primary missions of the 36th Division when it arrived in the Rhone Valley from Grenoble. By a division order at 1915 hours on 22 August, the 141st Infantry Regiment was directed to set up a roadblock north of Montelimar. The 141st Regiment was unable to comply with the order, since the Germans had the area under intense artillery fire.

Efforts to establish a roadblock were not resumed until after the initial failure to capture the town of Montelimar. On the morning of 25 August Task Force Butler attempted to put in a roadblock on Highway 7 near the village of Saulce-sur-Rhone north of La Coucourde. However, because of overwhelming enemy pressure, the venture failed. Later on the same day a second attempt was made by the 141st Regiment, some two and a half miles south of Saulce-sur-Rhone. This effort was also unsuccessful.

Late on 25 August a third attempt was made by the 141st Regiment to block Highway 7 at the village of La Coucourde. This block was protected by a platoon of infantry, six tank destroyers, and three tanks. Enemy armor, supported by infantry, broke through; and the position had to be abandoned. On the following day Task Force Butler was instructed by the 36th Division to, "alert your whole force for immediate movement to counterattack, seize, and restore block on Highway 7 at La Coucourde. Attack by way of Marsanne-Condillac-Coucourde." Although Task Force Butler had moved northward through the Condillac Pass and had reached Highway 7 by 0630, the highway had not been cut by 1200 hours, 27 August. One battalion of infantry



THIS PAGE IS UNCLASSIFIED

and one company of medium tanks, supported by two battalions of artillery, failed to stop the German thrusts of tanks and infantry.

The mission of the 133rd Field Artillery Battalion was changed and directed exclusively into the Rhone Valley in the vicinity of

IMMOBILIZED GERMAN CONVOY

"... enemy convoys had been under constant artillery fire since 21 August ..."

Condillac, adding weight to battery fire already adjusted on the highway. This marked the beginning of the artillery's tremendous destruction of the enemy who was endeavoring to escape northward along Highway 7, and, since the enemy provided so many targets, the batteries of the 133rd Field Artillery Battalion had to be separated into platoons in order to fire the maximum number of fire missions. At one period of the day the battalion was firing seven separate missions at once. Even this method was inadequate, so an individual gun was hauled to the top of a hill, to one of the company observation posts; and direct fire was brought to bear on the roads and railroad below.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

By 2130 hours on 27 August the 1st Battalion of the 141st Infantry Regiment reported that a roadblock had been created by wrecked enemy vehicles, put out of action by American artillery firing from the hills east of the highway. German tanks and motor transports were attempting to by-pass the barrier of debris along Highway 7 in order to reach the Drome River. Between Montelimar and Loriol enemy convoys had been under constant artillery fire and air attack since 21 August.

There was not enough artillery ammunition available to inflict all the damage that could be done, despite the fact that ammunition trains hauled day and night. Within battalions and between battalions, ammunition was shifted from one unit to another in order to have it available for the most remunerative targets. Every available man carried shells from one gun to another, and between batteries, jeeps and weapons carriers were called into service. On 26 August the 133rd Field Artillery Battalion had scored direct hits on a train of 55 cars in the Rhone Valley. Enough damage was caused to prevent further movement of the train. Two other trains, blocked by the wreckage, became targets for other artillery battalions in position farther south. All three trains were eventually captured with their contents, which included five large railway guns.

Highway 86, on the west bank of the Rhone River, was a less desirable escape route than Highway 7 on the east bank. The road on the west bank is narrow, exceedingly curved, and clings to the steeply rising crags which in many places project almost into the river. However, as American pressure against German traffic on the east bank increased, more and more traffic had to be routed over Highway 86.

As late as 27-28 August two important bridges across the Rhone River were still being used by the Germans in their retreat toward Lyon. The location of these bridges permitted a portion of the German traffic to avoid the more direct fire of American artillery and to free itself from the necessity of having to force its way through American roadblocks on Highway 7.

One bridge was about two miles west of Montelimar. A main route led directly out of town to the bridge and across to the western

bank of the Rhone River. With the Germans still in control of Montelimar they could divert traffic to the other bank. The second bridge across the Rhone was near the mouth of the Drome, at the extreme end of the battle area. Since the bridge was out of range of American artillery and since the Drome River could be forded at many points, the Germans diverted considerable military traffic from the west bank to the east.

The harassing activities of the FFI upon German traffic moving northward along the western bank and the periodic shelling by American artillery from across the river were insufficient to do more than disrupt traffic for short periods. The failure to deny the enemy the use of the two bridges across the Rhone allowed the Germans to exploit the tactical advantage of possessing an alternative escape route.

Control of the hill masses to the north and the northeast of Montelimar was the key to the developing tactical situation. Since the supply line of the 36th Division came into the battle area from the northeast, enemy control of the hill masses represented a potential threat. Condillac Pass served not only as a route of communication between the Roubion Valley and Highway 7 at La Coucourde, but also as a base for operations against the hill masses to the southwest of the pass. The Condillac Pass was constantly threatened from the north by enemy activities along Highway 7, and from the south by armored thrusts along the Roubion River Valley. It was this lack of an adequate base from which to operate that accounted for the difficulties of securing control of the hill masses.

The 3rd Battalion of the 141st Regiment was concerned with the protection of the main regimental supply line that ran diagonally southwest from Crest. Holding a position at the south entrance of the Condillac Pass, it was under German pressure from the direction of Bonlieu and the Roubion Valley. The 2nd Battalion operated out of the Condillac Pass and directed its efforts toward attacks on the town of Montelimar to the southwest. The 1st Battalion was concerned chiefly with efforts to block Highway 7 immediately north of La Coucourde.

Each of the three battalions received constant enemy pressure during the entire period of the battle of Montelimar. The enemy's partial control of the high ground to the east of Highway 7 prevented the 141st

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

Regiment from fully accomplishing its tactical mission. Enemy success in penetrating the main line of resistance placed elements of the 11th Panzer Division and the 198th Infantry Division between the extended position of the 2nd Battalion along the Roubion River and its communications base at Condillac Pass. Only after prolonged and intense fighting was the battalion able to move northward and regain contact on 25 August.

It was not until the American 3rd Division reached Montelimar from the south, on 28 August, that the 141st Regiment was actually able to complete its assigned mission. On that date the 141st Regiment seized control of the hilltops and drove to the south across the Roubion River to overcome the remaining German resistance in the area. On 28 August the village of Montelimar was occupied by American forces. The tactical situation now demanded that efforts be made to halt the enemy before he could complete crossing of the Drome River. Operations along the Drome River represented the final phase of the Battle of Montelimar.

Crossing the Drome

The Drome River was the last barrier in the German retreat northward to Lyon. The river represented an important axis of communication and supply for all American forces in the battle area. In order to protect this northern flank, the 143rd Regiment was sent from Grenoble southwest to Bourg-de-Peage, a town between 20 and 25 miles north of Crest. From this point troops could be moved quickly to the defense of Crest on the Drome.

Bonlieu was the weak link along the main line of resistance, as the Germans knew from the captured Operations Instructions, so it was assumed that Crest would be their northern objective in any drive toward the Drome River from the south. On 24 August the Commanding Officer of the 143rd Regiment was notified to, "remain at Bourg-de-Peage . . . be prepared to move on Crest on short notice." Later in the same day when the threat to Crest became more apparent, this warning was supplemented by, "you must have the bulk of your force (at least one

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

infantry battalion plus all tank destroyers and artillery) in Crest by daylight, 25 August."

To increase the strength of the American defenses at Crest and along the Drome River, the 636th Tank Destroyer Battalion was sent to this area. Tank destroyers went into position on both sides of the bridge across the Drome at Crest, and roadblocks were set up to the north and northeast of town. The Commanding General of the 36th Division instructed the 636th Tank Destroyer Battalion to hold the roadblocks as long as possible in the event of an attack. If forced by the enemy, the entire battalion was to fall back on Crest and hold "to the last." As a last resort, the bridges across the Drome at Crest were to be destroyed.

Although the enemy made serious threats to the town of Crest, the restoration of the line at Bonlieu on 27 August tended to diminish the pressure. Throughout the entire period between 22 and 30 August the enemy did not cease to probe for crossings over the Drome. In the latter stages of the battle, efforts were shifted more and more toward the western portion of the river near the town of Loriol.

The village of Allex lies north of the Drome midway between Crest and the Rhone River. The 2nd Battalion of the 157th Infantry Regiment, which had been sent into the Montelimar battle area to reinforce the 36th Division, occupied the town of Allex by 2000 hours, 26 August. German activity to the north and west was reported. However, by 1200 hours on the following day the Germans had completely withdrawn, allowing the 2nd Battalion to establish and maintain roadblocks on three sides of the town. The Commanding General of the VI Corps ordered the 157th Regiment not to "press its advance toward Livron at the expense of making secure Crest and Allex."

By 27 August, American forces had progressed a considerable distance westward along the northern edge of the battle square, thus narrowing the German zone of escape across the Drome. At the end of the battle period, crossings were confined to a section of the river which did not extend more than six or seven miles upstream from its confluence with the Rhone.

THIS PAGE IS DECLASSIFIED IAW EO 13526

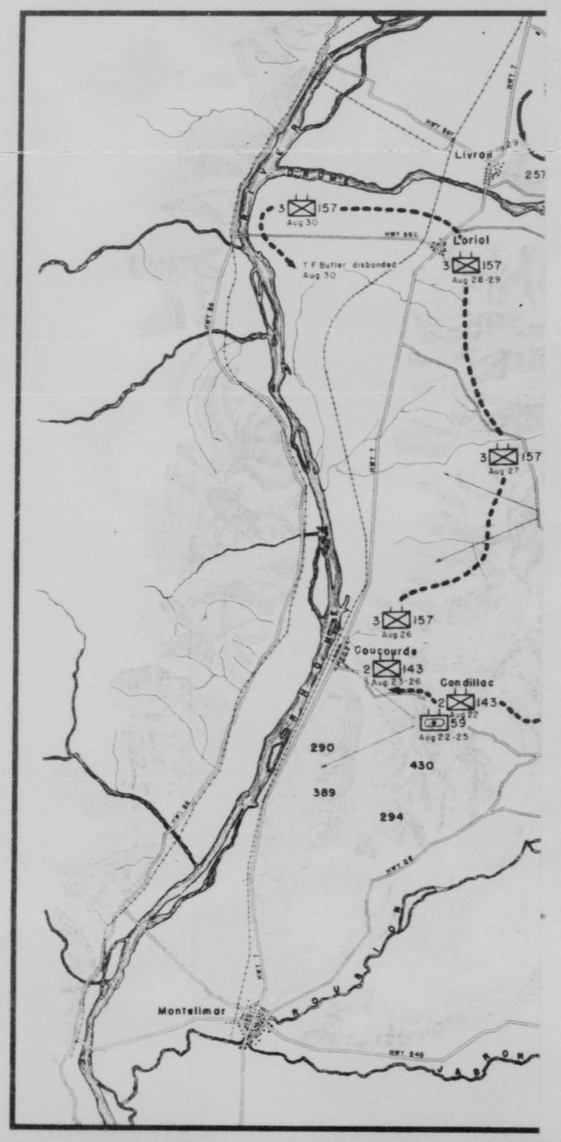
THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Closing this one remaining escape route of the German Nineteenth Army across the Drome required the use of air support to harass enemy traffic, to destroy bridges, and to demolish fording sites. As late as 25 August a main highway and railroad bridge were still being used by the Germans. On this date both bridges were knocked out by American artillery or air power. But since the Drome was fordable at most points during the month of August, the Germans utilized four fording sites in the vicinity of Highway 7. Two of these crossings were west of the railroad bridge, another between the railroad and highway bridge, and the last about 2,000 yards east of Highway 7. Enemy tanks crossed on railroad ties laid on top of crushed stone and gravel. Other heavy equipment which was unable to cross under its own power was winched over.

German fording activities were temporarily interrupted late on 27 August. On 26 August the river was at a low stage, but a thunderstorm in the mountains created a sudden flood, and for several hours all German traffic was stalled on the south bank. Immobile columns of vehicles offered increased opportunities for American artillery and air power, and a heavy toll was taken.

On 27 August the Commanding General of the Seventh Army requested that all possible air support be brought to bear against the Germans crossing the Drome. Although the German retreat from the battle zone was hurried, there existed the same degree of careful planning which had been evident throughout the previous eight days. Immediately to the north of the village of Loriol the Germans concentrated all their mobile equipment in a large assembly area. Traffic could then be diverted to the several fording sites as the tactical situation permitted. The 110th Grenadier Regiment of the German 11th Panzer Division was charged with moving equipment and personnel across the Drome River.



Since the westward advance of the American 157th Regiment at Allex constituted a threat to any German movement across the lower reaches of the river, the 110th Grenadier Regiment effectively covered German movements by offering strong resistance along roads leading west and northwest out of Allex. Later, elements of this regiment moved

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

to the northwest above the village of Livron to assist in the final phases of the crossings. By daylight of 28 August the major part of the German 11th Panzer Division was able to cross the Drome and move out toward the city of Lyon.

During the period 26-28 August intensive efforts were being made by VI Corps to close off the German movement. On 28 August the 157th Infantry Regiment, under the command of Brigadier General John H. Church, was instructed to, "extend vigorous reconnaissance and follow-up action from Crest, along the north side of the Drome River, through Livron to the Rhone." On the following day, the 36th Division

LIVRON

". . . the 2nd Battalion took up positions on the high ground to the east . . . "

instructed the 142nd Regiment to, "move with all possible speed via Crest to Allex, and push west to Highway 7 to cut off the retreating enemy." Although the weight of these two American regiments was engaged in this final effort to close off Highway 7 and the Drome River

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

crossing, so stubborn was the German resistance that Livron was not reached until 28 August. On this date the 3rd Battalion of the 142nd Regiment arrived northwest of the village, and the 2nd Battalion took up positions on the high ground to the east. At 1015 hours, 28 August, Livron was completely surrounded by the 142nd Regiment, and Highway 7 was at last blocked. It was now possible to cover the Drome River crossings with artillery fire, but unfortunately the great bulk of the enemy had already crossed.

On 27 and 28 August, more and more artillery was directed upon enemy movement up the Rhone Valley. The "long toms" of the 977th Field Artillery Battalion were directed upon the crossings of the Drome River near its confluence with the Rhone. In this area, between the villages of Loriol and Livron, these long range guns knocked out the railroad bridge, the highway bridge, and destroyed the ford which was being used by the Germans on the route of withdrawal. At the same time, the 133rd, the 59th, the 93rd, the 155th, and the 141st Field Artillery Battalions were firing into enemy traffic on the main highway, and on the secondary roads leading north of these river crossings.

On 28 August the artillery was shifted northward to intercept further enemy withdrawals up the Rhone north of the Drome. The 132nd Field Artillery Battalion moved to positions near Allex, to support the infantry attack on Livron and at the same time take the German transport under fire in the Rhone Valley. In order to get advantageous positions, artillery troops went into action in the infantry area where they received casualties from small arms and mortar fire. The next day these positions proved excellent ones from which to fire upon the Germans in the valley.

By that time the infantry had taken Livron, from which place the liaison officers of the 132nd Field Artillery Battalion secured good observation on the vehicle-packed roads in the valley. It was an "artilleryman's dream", since the enemy columns of armor, trucks, horse-drawn guns and carts, as well as personnel, as they came through the narrow bottleneck and forded the Drome River, were exposed to the constant pounding from American artillery. These observers fired the 132nd Field Artillery Battalion almost continuously, and also used C Battery

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

of the 155th, which had moved north. It was estimated that in this location alone the 132nd Battalion caused the destruction or abandonment of 500 vehicles and 50 artillery pieces.

After numerous attempts by Task Force Butler to block Highway 7 by means of infantry attacks from the lower ridges of Hill 300 and artillery fire from the high ground in the Marsanne Forest, the final decision was to capture the town of Loriol.

Loriol is situated on the lowland formed by the confluence of the Drome with the Rhone. Artillery placed along high ground east of Loriol would command the village, Highway 7, and all the fording sites

VEHICLES CAUGHT BY ARTILLERY ON OUTSKIRTS OF MONTELIMAR

". . . It was an 'artilleryman's dream' . . . Columns of armor, trucks, horse drawn carts and guns, as well as personnel, were exposed to the constant pounding of American artillery . . ."

across the Drome. The 1st Battalion of the 143rd Regiment was to attack Loriol from the high ground east of the village. Once the town had been captured, protective roadblocks could be set up; and the main

THIS PAGE IS DECLASSIFIED IAW EO 13526

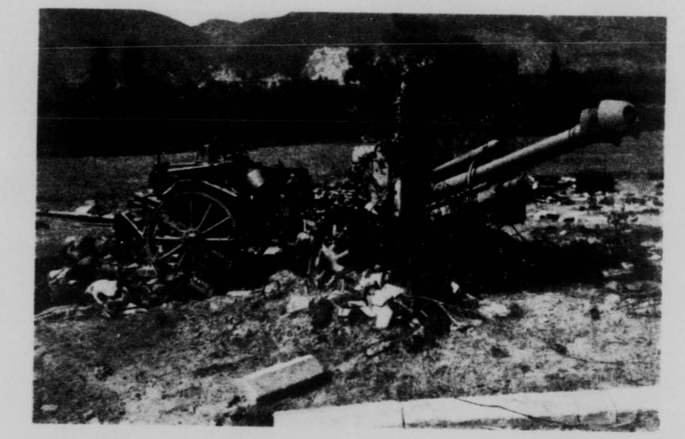
THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

body of the 143rd Regiment could join up with the elements of the 141st Regiment that were still operating along Highway 7 opposite Hill 300. The 753rd Tank Battalion was to support the infantry attack. The 117th Reconnaissance Squadron would protect the eastern flank of the operation by patrolling along the southern bank of the Drome, from Loriol eastward to the town of Crest. The 93rd Armored Field Artillery and the 141st Field Artillery Battalions were in direct support of the infantry in their advance against Loriol.

The tanks of the 753rd Tank Battalion approached Loriol by moving along a wooded trail paralleling Highway 7 and bordering the



RESULTS OF AMERICAN FIRE POWER

". . . Task Force Butler had a field day firing at traffic to the west of the roads . . ."

western ridge of the Marsanne Hills. By 1530 hours, 28 August, the main body of Task Force Butler had reached the high ground east of Loriol and reported, "having a field day firing at traffic to the west of the roads. No infantry opposition to speak of." German troops in Loriol

defended the town in order to shield the retreat of the last elements making their escape northward across the Drome. However, tanks wedged in north of the town; Loriol was tactically isolated and all organized resistance collapsed on 29 August. At 0915 hours on the following day the 1st Battalion of the 143rd Regiment reached the junction of the Drome with the Rhone River. The battle area was at last securely closed, and the Battle of Montelimar came to an end.

While the 36th Division was endeavoring to block the German escape route between Montelimar and the Drome River, the American 3rd Division was pushing the enemy up from the south. With all

WRECKAGE OF GERMAN CONVOY

". . . Germans . . . were forced to pass through the fire of the blocking force . . ."

avenues of escape from the rear sealed off, the Germans, following the northward course of the Rhone Valley, were forced to pass through the fire of the blocking force.

In retreating northward the German Nineteenth Army suc-

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

ceeded in maintaining a distance of from 12 to 18 miles between its own forces and the advance elements of the 3rd Division. By the evening of 27 August the 3rd Division had reached the vicinity of Montelimar from Orange. A "daylight line" was established for the final drive into Montelimar on the following day. This line extended along an east-west axis paralleling the entire southern border of the battle square and cut across Highway 7 a half mile south of the town. The three regiments of the division approached the battle zone with the 15th Regiment on the extreme west, the 30th Regiment in the center of the divisional formation, and the 7th Regiment on the extreme east flank.

ABANDONED GERMAN EQUIPMENT

". . . left behind by the enemy were destroyed vehicles, guns, and heavy equipment, which reflected the eight days of heavy fighting . . ."

The final drive into Montelimar on 28 August caught only scattered rear-guard elements. The 15th and 30th Regiments advanced straight northward across the "daylight line", while the 7th Regiment

turned westward to reach the Rhone River. By the end of the day enemy resistance in the town of Montelimar had ended, and all stragglers were picked up. The 3rd Division, in the movement from the south, had forced the German Nineteenth Army into the Montelimar battle area, but the American blocking force was not strong enough to entirely prevent the enemy from breaking out. By the end of August the Germans had succeeded in withdrawing the greater part of their personnel north of the Drome River; but left behind were destroyed vehicles, guns, and heavy equipment, which reflected the eight days of heavy fighting. The destruction of enemy equipment by American field artillery units

KNOCKED OUT ENEMY HALFTRACK

". . . Destroyed German equipment was found not only along the main highways, but also on minor routes and trails . . ."

was estimated to include between 2,000 and 3,000 vehicles, over 80 artillery pieces, and five large caliber railroad guns. Destroyed German equipment was found not only along the main highways, but also on

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

minor routes and trails. The enemy had neglected no avenue of escape in his haste to cross the battle area to the north of the Drome River. Each route and assembly area seemed to have been covered at one time or another by some unit of American artillery.

Supply Difficulties

During the eight day Battle of Montelimar the supply route from the battle square to the beaches by way of the Grenoble Corridor remained tenuous and was frequently threatened by enemy action. At no time during the period was the quantity of supplies brought into the battle area sufficient to satisfy actual needs.

The 36th Division supply dump was located at Aspres, a town in the Grenoble Corridor, 165 miles by road from the D-Day landing beaches. From Aspres the supply route progressed northwest along Highway 93 to the town of Crest, a distance of 70 miles. From Crest the routes fanned out in several different directions in accordance with the tactical situation. However, the chief axis of supply was to the southwest from Crest across a diagonal into Condillac Pass, some five or six miles northeast of Montelimar. The German breakthrough at Bonlieu on 25 August necessitated the temporary switching of the supply route to Highway 94, from Serres south of Aspres west to Nyons, then northwest into the battle area. Even this highway was at times threatened by enemy penetrations, since the Germans were seeking eastward routes of escape to avoid encirclement at Montelimar. There was also some enemy activity near the roadblock set up by the 142nd Infantry Regiment on Highway 94 at Nyons.

On 25 August the Germans established a roadblock on Highway 538 south of Crest which complicated further the problem of supply routes. This was the main supply line that connected Crest with the village of Marsanne at the southern end of the Condillac Pass. For a short time all supplies had to be transported over mountain roads, until this roadblock was knocked out by American tanks.

The scarcity of supplies was due mainly to the distances over which ammunition, rations, and gasoline had to be moved. Pre-D-Day

Allied bombing had destroyed important railroad bridges along the Grenoble Corridor, so that all supplies had to be trucked from the landing beaches to the divisional dump at Aspres. From Aspres supplies were further distributed by truck to the various units in the Montelimar area. The battle area was 235 miles by road from the Riviera coast, and the supply haul required a round trip of 470 miles.

Gasoline, food, and ammunition were the critical items during the Battle of Montelimar. Priorities and rationing had to be put into effect. Top priority on gasoline was given to the tank and tank destroyer battalions. Troops were placed on "$^{2}/_{3}$ rations" for the battle period. Artillery units were forced to "pass up" excellent targets because of the ammunition shortage.

The expenditure of ammunition is a gauge of the work done by the artillery in the Battle of Montelimar from 23 to 30 August 1944. The three battalions of light artillery fired 35,775 rounds of ammunition, and the medium battalion fired 1,890 rounds, making an overall total of 37,665 rounds. However, this is not an accurate figure, because this report includes only the four organic units of the division artillery. Four other battalions were also attached to the division, and their total number of guns was more than that of the organic artillery. It can be assumed that they fired at least half the number of rounds as that of the organic artillery.

The demand for artillery ammunition always far exceeded the supply. On 26 August the 36th Division had on hand 100 rounds per gun for the 105 mm howitzers, 125 rounds per gun for the 155 mm howitzers, and 78 rounds per gun for the "long toms." The next day the pro-rata reserve was 132 rounds for each light artillery piece, 138 rounds for each medium artillery piece, and 44 rounds for each 155 mm gun. By 27 August the ammunition supply had become so low that the Commanding General of the 36th Division ordered, "If a low of 25 rounds per gun is reached, cease firing at once except in the case of a dire emergency. Shoot at remunerative targets only."

The account of the 59th Field Artillery Battalion describes the ammunition supply problem in relation to the tactical situation:

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

On 22 August three German columns fanned out simultaneously toward Sauzet, Cleon, and Puy-St. Martin (towns along the Roubion River), hitting up from the south. Another came toward us at Condillac Pass from the northwest, and still another came from Crest . . . . There were numerous excellent targets of opportunity to be fired upon, but they had to be passed up because of the extremely low ammunition supply. The ammunition train could not be expected for another 48 hours; General Butler (Commanding Task Force Butler) ordered that when each gun was down to 75 rounds, no more would be fired without his permission. This was a precautionary measure against any possible enemy counterattack. As a result, ammunition was used very sparingly and then only at extremely juicy targets or those targets which could not be handled by smaller caliber weapons.

Commenting on the long supply haul, the narrative continues, "During the period from 22 August to 29 August the battalion ammunition train made four round trips to the beach at Ste. Maxime, each trip 470 miles."

The Second Attempt at Encirclement

Though the German High Command was successful in breaking through the Montelimar trap and withdrawing the greater portion of its forces north of the Drome River, there still remained another opportunity for the Americans to intercept the enemy before he could reach the Belfort Gap. The Seventh Army Field Order No. 4, 28 August, set forth the final directives for destroying the German Nineteenth Army before it could withdraw to the "West Wall." French Army B was directed to proceed northward along the west bank of the Rhone River and to assist in the capture of the city of Lyon. The American VI Corps was to advance due north on an axis Lyon-Beaune-Dijon. The joint action of the Americans and French would constitute the effective encirclement of the city of Lyon.

The General axis of advance would continue northward, since Beaune and Dijon were located almost due north of Lyon. However, Dijon was situated almost due west of the entrance to the Belfort Gap; and many German elements were expected to turn eastward upon reaching Lyon in order to take the most direct route to the Belfort Gap and the Rhine. Should the Seventh Army be successful in effecting a rapid

advance toward Dijon to join with Allied elements pushing southeast from Normandy, a large portion of the German Nineteenth Army would be "sealed off" and prevented from reaching the Rhine.

The Commanding General of the VI Corps ordered the 117th Cavalry Reconnaissance Squadron to act as a screening force and to maintain contact with the retreating enemy. The 45th Division was immediately ordered to advance northwest from Grenoble to cut across the axis connecting the City of Lyon with the border of Switzerland. The 36th Division was to continue its advance northward from the Montelimar battle area toward Lyon, and the 3rd Division was to mop up the remaining enemy elements in the Montelimar area. Finally, Task Force Butler, having completed the capture of Loriol along the Drome River, was to move eastward to Crest where it was to be disbanded.

The principle maneuvering element for this shearing operation of the Seventh Army was the 179th Infantry Regiment of the 45th Division. Advance patrols of the 179th Regiment exploited rapidly to the northwest from Grenoble. By 27 August the 179th Infantry had occupied the town of Bourgoin, midway between Grenoble and Lyon. The 179th Regiment continued to advance to the north and by 21 August had arrived at Pont D'Ain, which is midway between Lyon and the Swiss border. The occupation of Pont D'Ain cut off Lyon from the northeast. Roadblocks were established on all roads radiating east from Lyon, and the direction of retreat of the German Nineteenth Army was forced farther northward.

There still remained elements of five divisions of the German Nineteenth Army; the 11th Panzer, the 189th, the 198th, the 338th, and the 716th Divisions. All were using the upper Rhone Valley as an escape route. The 716th Division and part of the 189th had avoided the Montelimar trap by moving to the north on the west side of the Rhone. The other divisions, at least in large part, had infiltrated through the American trap at Montelimar. By 27 August the bulk of the 11th Panzer Division had crossed the Drome River and was well on its way to Lyon. The slower infantry divisions, however, were still south of the city of Lyon as late as 30 August.

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Destruction of mobile equipment considerably slowed down the rate of retreat of the German divisions. On 30 August 200 enemy vehicles were observed moving across the Isere River, north of Valence in the Rhone Valley. Of this total, 75 percent were horse drawn. In his haste to clear Lyon the enemy was moving his forces by day and night; columns of traffic made a profitable target for Allied air power and the FFI. It appeared that the enemy was attempting to increase the speed of evacuation and to salvage as much personnel and equipment as possible from southern France.

In its retreat from southern France the German Nineteenth Army not only protected its withdrawal northward into Lyon but also succeeded in rounding the Swiss border to the northeast of Lyon by the clever use of armor in screening its turning movement. By using the Swiss border as a hinge and by protecting his extreme right or western flank against encirclement, the enemy was able to swing his entire column to the northeast toward the Belfort Gap and ultimately reach the Rhine.

Air Support

The XII Tactical Air Command gave direct support to the ground operations of the Seventh Army in southern France. During the two week period beginning with D-Day this aerial support was directed against three specific objectives: 1) To cause maximum destruction of enemy defenses in the assault area. 2) To isolate the battle area by destroying the remaining rail and highway bridges across the Rhone and other rivers. 3) To attack enemy troop movements.

The main objective of American aerial bombardment during the days prior to the invasion, and on invasion day itself, was the fixed defenses in southern France. As American forces moved inland, the tactical mission of air support changed. Bombing of enemy communication lines and troop movements was now given priority, since the German Nineteenth Army had retreated far beyond its own line of fixed defenses. By D-Day only one bridge across the Rhone at Avignon remained open for enemy use. Traffic southward from the City of Lyon

toward the beachhead area had also been interdicted by aerial activity. Routes from southern France eastward into Italy through the Alpine Passes or along the Riviera were severed by operations of the XII Tactical Air Command.

The German ground forces worked feverishly to restore bridges and routes of communication. By 17 August, two days after the Seventh Army had landed, the route southward from Lyon on Highway 7 had been re-opened. The railroad paralleling the Riviera coastal route into Italy was operating for one way traffic. The Rhone River bridge at Orange and the Drome River bridge at Livron were being repaired for the second time. Eleven days later, on 28 August, the Germans were able to restore partially three Rhone River bridges for limited use; but the railroad line between southern France and northwestern Italy had again been cut by American aerial bombardment.

By the beginning of the second week of American operations in southern France there was a fundamental modification in the objectives of the XII Tactical Air Command. It was realized that further wide spread destruction of rail and highway communications would be of greater disadvantage to the rapidly advancing American Seventh Army than to the retreating German Nineteenth Army. Tactical progress and the supply build-up of the Seventh Army were at times held up by bridges or stretches of road which had been destroyed a few days previously by American air power. Since the possibility of new emergency elements being brought into the battle area was remote, the XII Tactical Air Command abandoned the bombing of strategic communication lines and concerned itself with blocking future enemy escape routes or close cooperation with the ground forces in specific tactical missions. Finally, because of the rapid advance of the Seventh Army and the sabotage efforts of the FFI, aerial activity was given over exclusively to "day to day" actions as indicated by the immediate situation on the ground.

From 21 to 28 August the Tactical Air Command flew 3,299 effective sorties in southern France and dropped 1,907 tons of bombs. Of this tonnage, 851 tons were dropped on lines of communications, and 953 tons on enemy concentrations on the ground. However, from 29

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

August to 4 September the Air Command flew 1,303 effective sorties and dropped only 50 tons of bombs. This reduction in sorties flown and bomb tonnage dropped reflected the shift in emphasis from so-called strategic bombing to isolated tactical bombing. The factor of distance from air bases also played an important part in the relative decline of aerial activity during the latter part of August.

The tactics employed in the battle of Montelimar made the problem of air support very complex. Direct air support consisted primarily of strafing individual groups of enemy personnel and equipment and of destroying enemy communications, such as bridges, highways, and firing sites. To achieve these ends, and as a safeguard to friendly forces, periodic bomb safety lines were established. These bomb safety lines set forth the bounds behind which American planes should not bomb or strafe because of the presence of friendly ground troops. However, there was always a time lag between a change in the tactical situation and new modifications in the bomb safety lines. Should the ground forces effect a sudden breakthrough against the enemy, as often occured, friendly troops were likely to overrun the bomb safety line. Conversely, if the enemy should suddenly penetrate the American lines, as was the case at Bonlieu on 25 August, air support for the American ground troops could not be called upon.

When the Germans broke through at Bonlieu, the Commanding General of the 36th Division requested, "Attack on column and trucks on Montelimar road at N-985584." The response was, "air will not do it because it is inside the bomb safety line and a permanent change of the bomb line must be made if they are going to do it."

The stretch of road on Highway 7 between Montelimar and Livron offered many problems to the supporting air command. American troops were operating on the highway in and around the village of La Coucourde in the attempt to establish a roadblock. Close by, sections of the road were jammed with enemy personnel and equipment. When air support was requested, the Air Corps responded that, "there is not sufficient means of identifying friendly from enemy troops."

In view of these complicating factors of coordination between air and ground forces during the battle of Montelimar, the Air Corps placed

its main emphasis on the west bank of the Rhone and on the north bank of the Drome. American ground troops were not operating in strength on either the extreme west or north side of the battle square, and it was here that the XII Tactical Air Command concentrated its activities against retreating Germans. Aircraft of the XII Tactical Air Command and carrier-based naval aircraft operating from the Mediterranean worked, however, in as close coordination with the ground forces as the situation permitted. They added to the destruction by strafing the enemy columns on Highway 7 north of Montelimar and by bombing and strafing the columns south of the town. So remunerative were the targets developed by congested traffic and jammed vehicles behind roadblocks that, during the period of this operation, pilots "were constantly reporting all their ammunition expended on closely packed enemy vehicles". Aircraft also attacked the railroad paralleling Highway 7 and the road and railroad on the west bank of the Rhone. These attacks were so successful during the week 21-28 August that headquarters, XII Tactical Air Command, reported, "the number of MT destroyed or damaged rose to 1,402, while 263 railroad cars and 30 locomotives were hit". These excellent results were attained in a period of the most adverse conditions under which air support could be given ground forces. Elements of Task Force Butler and other combat units were pressing close to Highway 7 north of Montelimar, and bomb line restrictions continually hampered air operations.

A more definite conception of the heavy toll of enemy equipment taken by aircraft during the Montelimar operation may be derived from the statement of the XII Tactical Command Air Intelligence that, "it should be recognized that it was the brilliantly conceived and executed operation of Task Force Butler in effecting the roadblock which produced one of the finest air targets ever offered the tactical units of this command". As the attack against retreating enemy forces pushed north, air support continued its relentless pressure. On 29 August the aircraft of the XII Tactical Air Command caught 227 enemy motor transport fleeing along the Montelimar-Valence road and destroyed or damaged much of the convoy.

Prior to, and for several days after D-Day, American air

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

support had been based on the Island of Corsica. The minimum distance from Corsica to the invasion beaches was 140 miles; the air distance from the invasion beaches to Grenoble was 145 miles, to Lyon 195 miles. As the area of operations moved northward to Grenoble, the air distance from the Corsican bases to the site of the immediate ground operations became more than double that of D-Day. The rapid northward exploitation of the Seventh Army created a need for air bases in southern France so that air support could be more effective.

Since events had outstripped plans in southern France, temporary locations had to be selected and installations improvised so that air support could keep pace with the swiftly changing tactical situation on the ground. Within six days after the invasion six airfields were ready for operation in southern France. Some of these new airfields were nothing but fresh landing strips scraped from the vineyards. At Le Luc the airfield based two American P-47 Groups; at Sisteron four RAF Spitfire Squadrons; at Cuers three Spitfire Squadrons; at Frejus four RAF and one French Spitfire Squadron; and at Ramatuelle one FAF Spitfire Tactical Reconnaissance Squadron, one American P-51 Observation Squadron, and one American P-47 Group.

It was not until September, however, that air power could be fully exploited in the operations of the Seventh Army in France. By September the rate of American advance had declined sufficiently to permit a greater degree of coordination between the air and ground forces. This also allowed for the erection of airdromes, which had a greater capacity for planes and more complete equipment for maintenance and operation. Finally, as airfields were located farther inland, more time could be spent by American air power over target areas in the Rhine Valley and in Germany proper.

Conclusions

During the 15 day period between D-Day and the end of August the German Nineteenth Army lost 57,068 men taken prisoner of war by Seventh Army units. A large number of these prisoners were taken by the French in Toulon and Marseilles. In addition to these

losses of the Nineteenth Army there were the uncounted casualties of killed and wounded. The losses for the Seventh Army for the same period totalled 2,733 killed, captured, or missing in action. This more than 20-to-1 ratio of German losses may be explained in terms of the first 15 days of operations after D-Day. The Seventh Army's rapid expansion inland coupled with the Allied breakthrough from Normandy, jeopardized the position of the German Nineteenth Army in southern France.

The German decision to pull out was made in order to forestall possible isolation and loss of routes of retreat. In the execution of this

A GROUP OF SURRENDERED NAZIS

"... The German Nineteenth Army lost 57,068 men, prisoners of war by Seventh Army units ..."

disengaging maneuver the enemy offered resistance to the Seventh Army only to make secure its avenues of escape. Rear guards were sacrificed whenever necessary. The lack of sufficient transportation caused

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

thousands of stragglers to be left behind. In this dual operation of screening ahead and of blocking to the rear, large numbers of enemy personnel, particularly less desirable troops, were abandoned so that the more mobile elements would be able to withdraw. Seventh Army units sustained losses when they made contact with forward screening elements of the enemy or with rearguard groups of fanatical Germans who had been ordered to resist to the last man.

CHAPTER X

Protecting the Eastern Flank

THE Seventh Army's rapid expansion north and northwest from the invasion beaches created an ever-lengthening eastern flank, which became an increasingly important aspect of the tactical picture. After D-Day the Allied beachhead separated the German 148th Reserve Division from the main body of the Nineteenth Army, although its presence in the Cannes-Nice area remained a threat to Allied lines of communication. It was known that the 148th Division was capable of harassing the Seventh Army's right flank by limited counterattacks, but even more serious was the possibility that the Germans might send reinforcements from northern Italy through the Alpine Passes. With the screen afforded by the 148th Reserve Division, it might be possible for the enemy to build up sufficient strength to launch a major counter-attack with the object of severing Allied supply lines and overruning beach installations.

Reported enemy motor movement southwest from Turin and west from Alessandria in the direction of the French Riviera underlined the possibility of a counterattack from the east. Between 20 and 23 August two unidentified enemy divisions were thought to be en route to southeastern France. However, the Allied High Command thought it improbable that the enemy would attempt to move significant numbers of troops through the east-west Alpine Passes. Mountainous terrain with narrow defiles and winding roads, which could be easily blocked by air power, and French resistance groups made such an undertaking too hazardous. It was more likely that the Germans considered the occupation of the Alpine Passes necessary in order to prevent any Allied

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

entry into northern Italy which might jeopardize the rear of General Kesselring's forces.

Field Order No. 2, issued by Seventh Army on 19 August, took into account the situation on the right flank by providing that the 1st Airborne Task Force plus certain attached units would relieve the 36th Infantry Division by 20 August and establish a general defensive line from Fayence to La Napoule, the army's eastern flank. In addition, the 1st Airborne Task Force was to reconnoiter the general line Seranon-Grasse-Cannes. Three major subordinate units were assigned operational zones in accordance with the tactical objectives involved. The 509th Parachute Infantry Battalion was given the coastal zone and ordered to advance to the approaches of Cannes. The 1st Special Service Force, on the left flank of the 509th Parachute Battalion, was to occupy defensive positions with Grasse as its ultimate objective. The 517th Parachute Regimental Combat Team was to advance in the northern sector and seize St. Vallier. Other units of the 1st Airborne Task Force were assigned defensive or supporting missions.

The strategic role of this flank protection force was essentially defensive. Nevertheless, the nature of the terrain is such as to permit limited advances, though movement is very largely confined to roads. As one approaches the Franco-Italian border and crosses the Var River, closely-set, steep mountains rise sharply from the coast to heights of 5,000 feet and over from Nice to Switzerland. The Var Valley offers limited possibilities of deployment south of St. Martin du Var. But elsewhere along the Italian border rugged slopes and steep narrow valleys make movement off the roads difficult even for infantry. Nevertheless, the terrain is ideal for defensive warfare. Should the German 148th Reserve Division be driven into the passes along the Franco-Italian border, the protection of the eastern flank of the Seventh Army could be carried out with a minimum of forces.

Other circumstances dictated that German forces on the eastern flank be pushed back to the Italian border. The entire French nation attached special importance to an early liberation of Cannes and Nice. The reasons were more psychological than military, although harbor facilities at Nice would no doubt be useful.

Southern Sector

The southern sector extended from the Mediterranean coast to Larche Pass, a distance of about 60 miles. The airborne force on the eastern flank conducted the bulk of its operations within 15 miles of the coast, although a small mobile patrol was dispatched to the north to guard the roads approaching Larche Pass. As American troops crossed the Var River and advanced on Nice, an organization adequate for strong defense was dispatched to the Pass. Dispositions on the flank were modified to fill the 50-mile gap which had come to exist between the Larche Pass and the northern elements of the main body of the Airborne

Task Force. Elements near the coast advanced east almost to the Italian border.

The 509th Parachute Battalion and the 463rd Parachute Field Artillery Battalion, reinforced by tank destroyers and engineers, con-

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

stituted a combat team to which was assigned the extreme southern sector of the eastern flank. Cannes was to be the first major objective. A few miles to the southwest of the city the enemy was well entrenched on the heights to the north and to the south of La Napoule and dominated the coastal road. Plans were made to attack La Napoule from two directions. The 1st Battalion, reinforced, of the 551st Parachute Infantry in support of the operation against Cannes was to attack toward La Napoule from Mandelieu on the north, while the 509th Parachute Battalion moved along the lower coastal road to attack from the southwest.

Early on the morning of 21 August the 509th was in position to attack. Preceded by a heavy artillery and mortar preparation against enemy positions on the heights, the battalion jumped off in two-company strength. By mid-day the first enemy fortified position had been taken. The battalion continued fighting throughout the following day in order to clear the enemy from the southern positions dominating the approaches to La Napoule.

Enemy artillery was at first quite active, but counter-battery fire from supporting Allied war vessels soon caused the Germans to withhold their fire. After high ground south of the town was taken La Napoule was quickly mopped up. This initial success was further exploited by an advance into the Siagne Plain and the approaches to Cannes. The 509th was now firmly established on the west bank of the Siagne River.

Meanwhile, the 551st Parachute Infantry Battalion had fought its way over rugged country to reach the Les Termes-Mandelieu road to the north of La Napoule. This secured the northern flank of the 509th Parachute Battalion. Entry into Cannes was delayed until a suitable crossing could be constructed over the Siagne River. Engineers worked throughout the night of 23 August constructing a ford and clearing mine fields. Patrols, which had been sent across previously, returned with the information that the enemy had completely abandoned the city.

After clearing mines on the approaches to the city, the 509th Parachute Battalion entered Cannes at 1700 hours on 24 August. The

streets were lined with wildly-cheering people. Some were crying openly. Others threw flowers into passing American vehicles.

Time was of the utmost importance and the 509th Parachute Battalion moved straight through Cannes and eastward on to Antibes. Simultaneously, the 1st Battalion of the 551st Parachute Infantry, which

APPROACHING CANNES

"... Entry into Cannes was delayed until a suitable crossing could be constructed over the Siagne River ..."

had followed the 509th Battalion in column across the Siagne, turned north at the outskirts of the city and followed Highway 567 to Mougins. This move secured the left flank of the southern sector and established contact with the 1st Special Service Force farther north at Grasse. Throughout 25 and 26 August the 509th Battalion sent aggressive patrols to the north of Antibes toward Biot.

Pushing northwest to the Loup River on 27 August, the 509th sent out patrols to St. Laurent du Var on the west bank of the Var River.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Here numerous FFI, who had passed through the German lines, stated that the Var Valley had been evacuated by the enemy and that the city of Nice was clear. However, extensive minefields along the Var River made rapid progress difficult, though patrols moved some distance up the river in an effort to establish contact with the enemy.

A FRENCH MARINE POSTS "DANGER" SIGN AT ENTRANCE TO NICE

". . . extensive minefields along the Var River made rapid progress difficult . . ."

In the last days of August, Major General Robert T. Frederick, commanding the 1st Airborne Task Force, requested permission to occupy Nice: "Conditions now existing in Nice make it urgent that the city be occupied by Allied Forces as soon as possible. Unless some show of organized Allied military strength is made within the city at this time, it is feared that riots and other civilian disturbances will reach such a scale as to seriously damage American prestige in this area." The Commanding General granted permission. On 30 August the 509th Combat Team crossed the Var River and occupied the city of Nice. One

column moved north to St. Andre immediately and established contact with the 1st Special Service Force, and the other proceeded east along the coast to Beaulieu.

Entry into the State of Monaco was forbidden to Allied troops unless the principality was "known to be actually occupied by the enemy." If that were the case, it would become necessary to cross the border in order to secure the Seventh Army's eastern flank. From their position astride the St. Andre-La Turbie road, patrols from the 551st Parachute Infantry Battalion reconnoitered along the French-Monaco border. No contact was made with the enemy. A telephone communication from the FFI in Monte Carlo stated that the area around the world famous gambling resort was free of the enemy. An enemy strongpoint at La Turbie, however, continued to hold out for several days despite heavy shelling from supporting Allied naval units. In a fire fight which began on 2 September, the 1st Battalion of the 551st Parachute Infantry succeeded in driving the Germans from their positions. They retreated eastward to the vicinity of St. Roche, covering their withdrawal by fighting light rear-guard actions and by an extensive use of mines to block all avenues of pursuit.

The 1st Special Service Force had been attached to the 1st Airborne Task Force on 22 August. It was assigned the central zone of the eastern flank, relieving the 2nd British Parachute Brigade, which was returned to Italy. Its first objective was the city of Grasse, which was an important road junction astride the Route Napoleon (Highway 85). The 1st and 3rd Regiments took up positions along the line of the Siagne River. The 2nd Regiment was kept in reserve.

On 23 August troops of the 1st Special Service Force began an all-out attack on Grasse, which held a strategic position with respect to the eastern flank. The 1st Regiment moved across the Siagne River and attacked the village of St. Marc. The 2nd Regiment was committed and advanced to the north through Cabris, then swung east to reach the Route Napoleon north of Grasse. St. Marc fall after a brief fire fight. At dawn on 24 August Grasse was attacked simultaneously from the north and from the southwest. Both operations were carried out successfully, and the city was occupied against relatively light resistance.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Prisoners of war stated that the enemy had been evacuating the town for the past two days and that all artillery and heavy weapons had been withdrawn to Nice.

After the capture of Grasse the next objective was the Var River, which was in itself a natural defensive line. Intelligence reports suggested that the bulk of the enemy was withdrawing eastward over the coastal highway. Late on 24 August the 2nd Regiment of the 1st Special Service Force moved to the southeast to occupy the town of Valbonne, the center of the road net in the Grasse-Cannes-Nice triangle. The 1st Regiment, following the 2nd Regiment, drove on through Valbonne east to Biot, a small village about five miles north of Antibes. This maneuver cleared the northern flank of the 509th. A new thrust a few miles north of Valbonne secured the Route Napoleon as far as Cagnes and increased the pressure effected by the 509th against the enemy withdrawing along the coast road. Throughout 26 August the enemy launched a strong counterattack near Cagnes, but was forced to retire, leaving behind 100 battle casualties and 72 prisoners.

The remaining enemy forces in the area withdrew across the Var River. When the 1st Special Service Force arrived on the west bank, it had lost contact with the enemy. On 30 August the 1st and 3rd Regiments forded the river near Colomars, and sent out patrols to the east. The general advance continued slowly until 2 September when contact was again made with the enemy. Several strongly-held German positions were subjected to air bombardment as well as artillery fire. Patrols of the 3rd Regiment moved northeast along the Sospel Valley. By now the enemy had begun to consolidate his positions farther east in the mountains and limited his activities to defensive measures.

While the 509th Parachute Infantry Battalion was approaching the city of Cannes and the 1st Special Service Force was preparing its attack against Grasse, the 517th Parachute Regimental Combat Team moved up on the left flank of the 1st Airborne Task Force. This combat team was made up of the 517th Parachute Infantry Regiment, the 460th Parachute Field Artillery Battalion, and the 596th Airborne Engineer Company. After the 517th RCT had relieved elements of the 36th Infantry Division in the Fayence-Callian area, one battalion crossed the

Siagne River and occupied St. Vallier, a town on the Route Napoleon, on 24 August.

The 517th RCT regrouped on the high ground east of the St. Vallier-Grasse road for a drive to the Var River. Throughout this advance enemy activity was negligible. On 29 August the main body of the 517th RCT less one company crossed the Var River and continued east over difficult terrain. Forward patrols made contact with the enemy, but except for occasional harassing artillery fire the Germans offered little resistance. By 3 September the 517th RCT had driven the enemy into the mountains near Peira Cava.

ROAD TO DIGNE

"... The 517th RCT had been assigned the responsibility of patrolling ... and of maintaining contact with elements of the American VI Corps in and about Digne ..."

On 22 August the 517th RCT had been assigned the responsibility of patrolling the road net to the west and south of Larche Pass, and of maintaining contact with elements of the American VI Corps in

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

and about Digne. The reconnaissance platoon of the 695th Tank Destroyer Battalion was attached to the 517th RCT for this purpose. Maintaining contact with the VI Corps and patrolling from the Var River to the Italian border at Larche demanded considerably more gasoline and motor vehicles than could be made available over long supply lines. However, good use was made of 1,000 gallons of gasoline and 15 vehicles which had been previously captured from the enemy by the 1st Airborne Task Force at Le Muy.

The 1st Airborne Task Force directed on 28 August that the 550 Airborne Infantry Battalion, reinforced by artillery, mortars, and tank destroyers, proceed immediately to the vicinity of Larche Pass. Allied intelligence reported that a considerable concentration of enemy troops was known to be in the area behind the pass, and it was feared that large-scale infiltration might be attempted. Since the enemy had taken up defensive positions along the Franco-Italian frontier as far as Switzerland, and since the highway through Larche Pass was sufficient to accommodate heavy traffic, the German LXXV Corps might assume an aggressive role.

A motorized patrol of 15 officers and enlisted men, in compliance with orders issued by the 1st Airborne Task Force, left Grasse on 27 August for Barcelonnette. The patrol reported that the enemy was in the process of occupying strategic passes, including Larche, in order to improve his defensive positions in the Maritime and Basses Alps. Two days later the main body of the 550th Combat Team moved to the neighborhood of Barcelonnette, where forward elements reconnoitered eastward and established temporary outposts. In this operation the French Forces of the Interior and the Inter-Allied Mission (paratroopers who had been dropped in the area weeks and even months before D-Day) were of great assistance because of their intimate knowledge of the terrain and enemy dispositions. From Barcelonnette patrols were sent out in all directions. It was soon discovered that Larche Pass was firmly held by the enemy and that the Germans were also active near Condamine and Jausiers on the highway between the pass and Barcelonnette. An air bombardment mission was requested at several

points along the Italian approaches to the Larche Pass in order to harass the enemy and complicate his supply problem.

The enemy, according to a captured field order of the German 148th Reserve Division, had anticipated the advance of the 1st Airborne Task Force and had taken steps to withdraw to the line of the Var River. This line was to be held only so long as casualties were moderate and the threat of encirclement remote, for when these conditions could no longer be satisfied the enemy expected to retire to prepared positions along the frontier. In planning the defense of the southern sector of the Allied eastern flank it was natural to assume that German countermeasures would be built around well-defended strongpoints covered by outposts and roadblocks. Along the Menton-Sospel-Breil road, the Nice-Ventimiglia highway, and at Turini Pass, the enemy had skillfully camouflaged artillery positions covering crossroads and narrow, defiladed stretches.

The German 148th Reserve Division began withdrawing from the line of the Var River on 29 August. Rear guards were left behind to yield only when pressure became great, since the main object of this delaying action was to prevent any quick Allied thrust which might be followed by the movement of artillery and heavy weapons. The Germans destroyed or damaged several fords, a highway bridge, and a railroad bridge, as they withdrew from the Var. By the end of the period the 148th Reserve Division had ceased to be a part of the German Nineteenth Army. It was subsequently incorporated into the newly formed LXXV Corps, which had the mission of defending northwest Italy against any Allied threat to the rear of German forces.

The enemy made skillful use of mines throughout this phase of withdrawal by placing them in all possible by-passes after blowing craters in the roads. Prisoner of war interrogations indicated the enemy had limited supplies, low morale, and a consequent high rate of desertion.

The crossing of the Var River and the establishment of a defensive line to the east of the Var Valley marked the opening of a new phase in the protection of the Seventh Army's eastern flank. Difficult terrain restricted maneuver and made supply problems acute. In order

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

that the 1st Airborne Task Force be properly organized and equipped for mountain warfare, it was decided "to make this unit into a 'light infantry division' with strength of about 10,000, and equipped largely with ¼ ton and ¾ ton trucks". The 1st Special Service Force was to remain attached to the 1st Airborne Task Force and continue to assist the protection of the Seventh Army right flank during the month of September.

The defensive plan for the southern sector of the eastern flank was contained in Field Order No. 8, issued by the 1st Airborne Task Force on 3 September. The 1st Special Service Force was ordered to the right flank of the defense line to relieve the 509th Regimental Combat Team. By 8 September the 2nd Regiment, advancing along the coast road, had entered Menton and reached the Italian border. Here the advance stopped, for it was anticipated that the northward advance of the Fifth and Eighth Armies across the Po Valley might cause the German armies in northern Italy to seek an escape route by way of the Franco-Italian frontier.

Meanwhile, the 1st Regiment of the 1st Special Service Force moved up to occupy the high ground west of the Castillon-Menton road on the afternoon of 8 September. The 3rd Regiment, having advanced against isolated enemy resistance, established roadblocks to the east and north of Castillon. As Special Service Force troops pulled up to the Italian border, the airborne division ordered this line to be held without advancing beyond. Here the enemy counterattacked at several places, but, except for a position on high ground northeast of Menton which was temporarily lost, he was unable to dislodge holding forces from their positions.

Because of difficulties of the terrain the 1st Special Service Force was compelled to resort to patrolling, raiding, and generally improving its defensive positions. Engineers went to work improving roads so that supplies could be brought up more easily. Jeep trails had to be constructed in order to reach inaccessible outposts and gun positions, and cableways were improvised for bringing up supplies. The ever-increasing distance to dumps and supply points in the Marseille area constantly over-taxed organic transportation.

On 4 September the 517th RCT had moved to the left flank of the 1st Special Service Force, in compliance with Field Order No. 8 of the 1st Airborne Task Force. Its objective was the establishment of a defensive line on the heights east of Sospel to control the Menton-Breil-Turin highway. By 11 September all three battalions were on the line, and the 2nd Battalion began an attack against an enemy strongpoint on the approaches to Sospel. From their positions in the pass the Germans controlled the roads in the Sospel Valley. It was clearly impractical to carry out a general assault on the town of Sospel. Enemy positions in and about the town were considered strong, and artillery and mortar fire from the nearby mountains made any large scale infantry movement difficult. The 517th Regimental Combat Team made slow progress throughout most of September in the face of determined German resistance and counterattacks. German artillery continued to shell all important roads leading to the Italian border, as the enemy withdrew into mountain fastnesses.

A gap of approximately 50 miles existed between Larche Pass and the sector occupied by the 517th RCT. The reinforced 509th Parachute Infantry Battalion, which had operated along the coast in the capture of Cannes and Antibes, had been shifted to the north to fill this gap under order of the 1st Airborne Task Force. Here, on the long mountain reaches of the eastern flank, the Germans had merely to cross the Tinee River to find themselves considerably west of the American line. The enemy, however, now showed no indication of becoming active offensively along the Franco-Italian border.

On 26 September the 1st Airborne Task Force passed from the control of Seventh Army to Sixth Army Group. The threat to the Seventh Army's eastern flank in the southern sector had virtually passed. The fear of a mobile thrust against over-extended Allied supply lines was now reduced to a minimum.

The Northern Sector

Originally the northern sector extended for 30 miles from the Larche Pass to Mont Genevre Pass. As the Seventh Army moved north-

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

ward this distance was greatly increased. In the final phase the flank extended from Larche Pass to the Swiss border. The enemy in the northern sector was eventually forced back into the mountain passes.

As the armored spearhead of Task Force Butler drove northward toward the approaches to Grenoble, it very rapidly elongated the

APPROACHES TO GRENOBLE

"... Task Force Butler drove northward toward the approaches to Grenoble ..."

Seventh Army's right flank. Following closely behind the Task Force the 36th Division had sent its 142nd RCT north along the Route Napoleon (Highway 85) to arrive at Gap on 22 August. There the 2nd Battalion was detached and sent east to Guillestre with instructions to secure the right flank of the 36th Division.

Guillestre controlled two important roads, one running northeast to Briancon and the other southeast to Larche Pass. The battalion set up roadblocks and maintained constant vigilance to prevent enemy raiding parties from harassing the supply lines of the 36th

Division and Task Force Butler. The Germans were reported to be holding Briancon in considerable strength, and in order successfully to contain this force the 636th Reconnaissance Troop was sent east from Grenoble toward Briancon.

On 23 August the 36th Division moved to the Rhone Valley, and the 142nd Regiment was relieved by the 180th Regiment of the 45th Division. The mission of the 180th Infantry was to maintain active patrolling and reconnaissance of the road net connecting the more important Alpine passes. To cover the area adequately the 1st Battalion was stationed at Gap, the 3rd at Chorges, and the 2nd divided between Embrun and Guillestre. Shortly after the 180th Infantry took over the sector, the FFI reported that the enemy had destroyed a roadblock at Larche Pass and was advancing westward. In order to contain this threat, the 2nd Battalion sent a patrol south from Guillestre through St. Paul. While establishing a roadblock in the vicinity of St. Paul on 25 August, the 2nd Battalion patrol drew fire from a German column which had come out of Larche Pass. The fire was returned. The Germans now changed their direction of advance southward toward Barcelonnette.

In the Col de Vars, north of St. Paul, the 180th Infantry put in a roadblock defended by a platoon, reinforced by an antitank gun. Simultaneously the 117th Reconnaissance Troop was ordered to send out motorized patrols over all roads in the St. Paul-Barcelonnette area. On 26 August patrols reached the approaches of the Larche Pass. They found that the Germans had withdrawn east into the mountains, but still were firing artillery on the roads leading to Larche.

Meanwhile, a reinforced platoon was sent north from Guillestre to Briancon and discovered that the enemy had withdrawn to the vicinity of Mont Genevre Pass. The platoon, reinforced by groups of FFI, established itself in a fort to the northeast of Briancon and maintained contact with the main body of the 180th Regiment at Guillestre by means of motor patrols. One battalion was detached from the 180th Infantry and sent to reinforce the 179th Infantry in the vicinity of Grenoble, and by 27 August the remaining two battalions of the 180th Infantry were preparing to leave for the Grenoble area. The following day relief was completed when the defense of the sector was taken over

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

by the Provisional Flank Protection Force, later known as Task Force Bibo.

In order to release the entire VI Corps for operations in the Rhone Valley, the Seventh Army agreed to assume full responsibility for protecting the eastern flank with other troops at the army's disposal. The decision resulted in the activation of the Provisional Flank Protection Force consisting of Troop A of the 117th Cavalry Reconnaissance Squadron, one company each from the 2nd, 3rd, and 83rd Chemical Battalions, two platoons of the 180th Infantry Antitank Company, and one battery of the 171st Field Artillery Battalion. The commanding officer of the force was Lieutenant Colonel Harold S. Bibo, a War Department observer with the Seventh Army.

The Provisional Flank Protection Force was responsible for the zone east of Grenoble, northward, from Larche Pass to Albertville. It was to maintain contact with the 1st Airborne Task Force on its right flank by means of a small detachment stationed at Digne. On 27 and 28 August Task Force Bibo established roadblocks at St. Paul and Mont Genevre. Each was manned by a chemical mortar company supported by one antitank gun. The FFI reported that the Germans were present in considerable strength along the Maurienne Valley, between Briancon and Albertville, which pointed to a possibility of an attack on Briancon from the north.

During the morning of 28 August Company C of the 83rd Chemical Mortar Battalion, which was located outside Briancon, became engaged in a fire fight with a small enemy group. The FFI, who were then occupying Briancon, dispatched 100 men to reinforce Company C. As an enemy attack in company strength developed against Fort du Daupain, artillery in Briancon began counterbattery fire against German gun positions to the southeast of the town. Nevertheless, small enemy groups infiltrated into Fort Randoulette, Fort de Trois Tetes, and other elevated places which afforded the enemy excellent observation of Allied movement.

Intense enemy shell fire forced the 83rd Chemical Mortar Battalion and supporting artillery troops to evacuate Briancon and to take up new positions northwest of the town along Highway 91. Following

a stiff rearguard action, Americans set up a roadblock at the entrance of the highway tunnel at Lautaret Pass. The tunnel was prepared for demolition. Other roadblocks at St. Clement and St. Crepin, west and northwest of Guillestre were put in. The Commanding Officer of Task Force Bibo requested infantry reinforcements and antitank support. Shortly afterward, he was instructed by higher authority to effect the greatest possible delaying action; the 180th Regiment had been alerted to come to his assistance in the event of a German breakthrough.

It was known that Task Force Bibo would shortly be relieved by units of the French Army, and this partially accounted for the reluctance to shift any substantial reinforcements into the area. The FFI circulated a report that Briancon had been lost because of a shortage of ammunition. It is no doubt possible that the FFI itself did lack sufficient supplies for any sustained campaign. However, there is no indication that the Provisional Flank Protection Force was hindered in its own effort by any shortage of ammunition.

On 31 August American patrols re-entered Briancon and found that the enemy had withdrawn to forts around the town. Task Force Bibo made no effort to retake the town. It chose instead to strengthen its own defenses by putting in and maintaining additional roadblocks.

The enemy undertook limited reconnaissance and sent patrols from Larche Pass as far west as Barcelonnette. The main body of the enemy continued to remain behind the pass. But he retained control over the road running from Condamine to St. Paul and was thus able to hamper liaison between the 1st Airborne Task Force in the south and the Provisional Flank Protection Force in the north.

During late August and early September the enemy became active in isolated sectors along the northern half of the Franco-Italian frontier. Several elements of the German 157th Reserve Division, formerly stationed at Grenoble, were evidently using routes in this area as a means of escape into Italy. Troops of this division were identified in the Barcelonnette sector. Elements of the German 200th Panzer Grenadier Regiment of the 90th Panzer Grenadier Division were also identified in the raid on Barcelonnette.

THIS PAGE IS UNCLASSIFIED

According to operational order No. 24 of French Army B, dated 29 August, the 2nd French Moroccan Infantry Division was to relieve American units in the Briancon-Embrun area and to cover the right flank of the Seventh Army by holding Guillestre, and the Mont Genevre, and Galibier Passes. It was also to maintain liaison with the 1st Airborne Task Force south of Larche Pass. By 2 September elements of the 2nd French Moroccan Infantry Division arrived in the neighborhood of Briancon and began relieving the Provisional Flank Protection Force.

The French Forces on the eastern flank possessed the necessary strength and equipment to take up the offensive. The primary object of its first mission was the recapture of Briancon. The French then proposed to launch two simultaneous operations, one to link up with the 1st Airborne Task Force to the south and the other to strike for the Maurienne Valley to the north. This second maneuver was to be coordinated with a movement south and east from Albertville to clear the enemy from the approaches to the Little St. Bernard Pass and thus gain control of the relatively simple road net which covered this area. Since topography confined the enemy to the roads, the problem of controlling the area was greatly simplified.

The 2nd French Moroccan Division was to be responsible for the recapture of Briancon and the encirclement operation in the Maurienne Valley. One Groupement de Tabors Marocains (Goumiers) was to move up to Larche Pass, south of Briancon. A regimental combat team of the 3rd Algerian Infantry Division was to be diverted from its northward course and assigned the task of mopping up the sector between Albertville and the Little St. Bernard Pass. The 2nd Moroccan and the 3rd Algerian Divisions in a coordinated maneuver were to drive remaining German forces back to the Italian frontier between St. Bernard and Briancon.

This strategic line of action needed a concentration of troops. The French plan included a step-down phase in order to employ the minimum security force that would be consistent with safety. As the mopping up of isolated valleys and the occupation of frontier passes was accomplished, the security mission of the Alpine region between Lake

Geneva and Larche Pass was to be assumed by Groupements of Moroccan Tabors, reinforced by the FFI. With the approach of winter and the hampering of visibility by heavy snows and mountain storms, additional battalions of FFI were to be employed.

By 2 September the French had secured the road nets southeast and northeast of Guillestre. Two days later reconnaissance elements had reached the outskirts of Briancon. Enemy batteries at La Vachette and Mt. Janus, on high ground to the northeast of the town, went into action. But by 7 September the French had overcome all opposition in the forts surrounding Briancon and were thus able to occupy the town. The Germans retreated eastward into Mont Genevre Pass, destroying bridges and damaging roads as they went.

FFI units by 9 September had occupied Seez, the key communications center just southwest of the Little St. Bernard Pass. To the south the twin drives by the 2nd Moroccan Infantry Division on the Maurienne Valley north of Briancon were making good progress. As the Maurienne Valley was being cleared of opposition, continued contact was maintained with the enemy both at the Little St. Bernard and Mont Genevre Passes.

Since the bulk of the Germans had been driven into the high passes, elements of the 2nd French Moroccan Division, south of Briancon, were relieved by the Goums. French units were thus released for offensive operations in the passes themselves. The enemy displayed few active tendencies and concerned himself with "passive withdrawal." Apparently, the evacuation process had been practically complete before the French took over the sector. Other than the taking of Briancon and the campaign on the approaches to the Little St. Bernard Pass there was little offensive activity. By the middle of September the French had completed their preparations for an offensive into the passes. But on 15 September the control of French Army B passed from the Seventh Army to Sixth Army Group, and their activities were no longer of direct concern to the Commanding General of the Seventh Army.

In general, military operations on the Seventh Army's eastern flank must be viewed in the light of defensive strategy. A situation

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

approximating equilibrium had been achieved by the end of September. Allied air superiority, coupled with the fact that the high mountains of the Alps between France and Italy provided a natural barrier, greatly minimized the danger of any large-scale counterattacks from northwestern Italy.

Except for the isolated aggressive gestures of the German LXXV Corps at Briancon and Barcelonnette, the enemy was content to withdraw into the mountain passes and await developments. On the other hand, the threat of an Allied advance into northern Italy no doubt caused certain anxiety to the enemy. The assumption that the 5th and 7th Armies would break through in Italy prompted the 1st Airborne Task Force to advance beyond the Var River and make a serious attempt to take Sospel, thereby gaining control of the important coastal highway leading from Italy. However, no Allied offensive in Italy materialized. After the French had cleaned up the area north of Larche Pass, the whole French-Italian frontier again became static.

CHAPTER XI

Consolidation of Seventh Army Gains

AT the end of August the Seventh Army had completed the liberation of southern France and was closing in on the city of Lyon. On the eastern flank, patrols of the First Airborne Task Force reached the Italian border. On the west bank of the Rhone below Lyon units of French Army B were pushing the enemy to the north, and French reconnaissance elements were advancing along the Mediterranean coast close to the Spanish border. On the north, VI Corps troops had already crossed the Rhone River where it flows into Lyon from the high Alps to the east and were operating northeast of the city. The American Third Army was advancing east, northeast, and southeast from Paris. All German troops south of the Loire and west of the Rhone-Saone Rivers were faced with complete isolation as the two Allied armies approached each other.

By 25 August plans for the junction of the forces of *OVERLORD* and *DRAGOON* were already under way. As General George C. Marshall wrote General Eisenhower:

> It begins to look as if your forces and Wilson's may approach each other very fast and that timely action may be required by the Combined Chiefs of Staff to insure coordination which maintains the impetus of our attack without respite.
>
> Air operations may require special treatment since the Tactical Air Forces may be overlapping in a few days . . . .
>
> Will you give us your thoughts on the foregoing and where and under what circumstances you will submit the recommendations, as provided for in your Directive, concerning your assumption of command of the Southern Forces.

Thus the "Mediterranean" phase of Seventh Army operations was drawing to a close, and the "European" phase was opening.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

On 29 August General Wilson; General Devers; Air Marshall Sir John Slessor, Deputy Commander, Mediterranean Allied Air Force; Major General L. W. Rooks, Deputy Chief of Staff, Allied Force Headquarters; and Major General John Connor, Commanding General, XII Air Force arrived at Seventh Army Headquarters. General Wilson desired to ascertain General Patch's future plans in order to coordinate them with General Eisenhower's movements and to make the necessary arrangement for the transfer, at the proper time, of his operational responsibilities to General Eisenhower.

General Patch disclosed that his tactical plan was to send VI Corps north from both Valence and Grenoble to Lyon. Thereafter, the advance would continue on the axis Lyon-Beaune-Dijon. After the capture of Lyon VI Corps was to be regrouped to operate on the line Autun-Dijon-Langres. The object was to make contact with General Patton's American Third Army. Elements of French Army B, the 1st Infantry Division, and 1st Armored Division, would maintain a strong reconnaissance force between Narbonne and Lyon on the west bank of the Rhone and would assist in the capture of Lyon. French Army B units east of the Rhone, the 3rd Algerian Infantry Division, the 2nd Moroccan Infantry Division, and the 9th Colonial Infantry Division, would advance north on the axis Sisteron-Grenoble-Bourg-Besancon and immediately relieve American VI Corps troops guarding the Alpine Passes. The First Airborne Task Force would assist French Army B in the protection of the VI Corps right flank facing the Franco-Italian frontier.

This was the plan. After the fall of Lyon the Seventh Army would be in a position to advance farther north. It would continue to push the German Nineteenth Army out of France and link itself with the eastward advance of the Third Army. French Army B and the 1st Airborne Task Force on the eastern flank would be brought together for the assumption of command by General Devers' Sixth Army Group.

General Wilson approved this tactical outline. It conformed with General Eisenhower's wishes for an American advance on the Army left flank to make contact with General Patton's Third Army, while the French advanced on the right flank to close the Italian and

Swiss borders. General Wilson proposed that operational control of VI Corps should pass from his command to that of General Eisenhower when the Corps was ready to operate north of Lyon. At that time General Dever's Advance Allied Force Headquarters would become Sixth Army Group. Although the forces then employed under Seventh Army did not seem to be large enough to warrant the activation of an army group, General Wilson thought it should take command of southern France in view of the length of communications, responsibility for port maintenance, civil affairs, and matters connected with the French Resistance Movement. Also there was the possibility that elements on the right flank of General Eisenhower's forces might either be merged with Seventh Army under Sixth Army Group or maintained through its line of communications.

The Occupation of Lyon

For the Germans, too, the "Mediterranean" phase of the war was rapidly approaching a conclusion. Captured documents and statements of prisoners of war revealed that Lyon was to be the initial assembly point for the trek northeastward for those German units fortunate enough to run the gauntlet at Montelimar. The troops were to be assembled and were to use the Lyon-Dijon highway for the continuance of the withdrawal. Screening action was initiated to the south, and bitter delaying actions were being fought at the important communications centers.

Most of the German Nineteenth Army passed through the Montelimar trap on 28 August. Battered remnants continued to withdraw up the Rhone Valley through Valence to Lyon and Dijon and turned eastward in the direction of Belfort and the Vosges. On 28 August no large movement north of Lyon was as yet evident, for the bulk of the German army was still south of the city. Despite heavy shelling, bombing, and strafing, the withdrawal along the east bank of the Rhone continued during daylight hours. The Germans fought only when forced to protect their evacuation routes from forward Allied units racing north and east to cut them off.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

On 1 September German forces pouring through the Lyon-Dijon funnel represented all that remained of the occupation forces of southern France. These included not only the units in contact with the Seventh Army, but also those German troops who had been in the Loire River-Bordeaux-Toulouse-Vichy area. Trying to reach some sort of safety in the east before being cut off by the approaching junction of the American Seventh and Third Armies were two German First Army divisions, the 16th and the 159th, and the Nineteenth Army's 716th Division evacuating on the west side of the Rhone, with which contact had not yet been established. Evacuees also included a mass of combat, supply, administrative, air force, naval, and governmental personnel. Enemy combat troops protecting this withdrawal comprised elements of the divisions that had been engaged on the Seventh Army front during the preceding two weeks.

The German 148th Reserve Division and 157th Reserve Division were retreating toward the Italian border. South of Lyon an estimated 8,730 combat effectives still actively opposed the Seventh Army. These included remnants of several divisions, such as the 11th Panzer, the 189th Reserve Division, and the 198th and 338th Infantry Divisions. But three other German divisions, the 16th, the 159th, and the 716th, were soon to appear in the order of battle. Captured German letters reflected a disintegrating morale, even a feeling of panic, among the fleeing troops. Their remaining hope was to withdraw as rapidly as possible, to join the southeastern wing of the German forces in northern France, and with them to form a defense line.

The end of August found the major elements of the Seventh Army forming a semi-circle along the line St. Etienne-Bourg-de-Peage-Voiron-Meximieux, around the rear of the retreating German columns. On the western end of the arc the newly organized French II Corps, under the command of Major General De Montsabert, was rapidly advancing west of the Rhone without enemy contact. Within this Corps the French 1st Armored Division was spearheading the attack on Lyon from the southwest. The towns of Serrieres and Firminy had already been occupied by 1 September, and the 2nd Regiment of Algerian

Spahis had passed through St. Etienne and St. Chamond and was within 20 miles of Lyon.

Farther south the French 1st Infantry Division was operating in the Nimes-Uzes area. East of the Rhone the 9th Colonial Infantry Division was still in the Marseille-Toulon area. The 3rd Algerian Infantry Division at Grenoble and the 2nd Moroccan Infantry Division at Gap, with attached armored units, were relieving the American VI Corps in the French Alps.

The divisions of the American VI Corps, pressing the Germans against the Rhone and Saone Rivers from Bourg-de-Peage and Voiron to Meximieux and Amberieu-en-Bugey, formed the center and northeastern end of the semi-circle. The 3rd Division, after mopping up in the Montelimar battle square, shifted its regiments to a new assembly area near Voiron, north of Grenoble. The 36th Division continued to pursue the retreating Germans up the Rhone Valley. The 141st Infantry cleared resistance at Valence and advanced northeast to Bourg-de-Peage, while the 142nd Infantry was advancing north from Livron up Highway 7. In the division center, elements of the 117th Reconnaissance Troops entered Vienne during the afternoon of 1 September and made contact with a German column on the Lyon road. Meanwhile the 45th Division had moved up Highway 75 from Grenoble toward Bourg-en-Bresse. Its forward elements were already in the vicinity of Meximieux and Amberieu.

Lyon was a military prize worthy of defense. It is France's third largest city, having a population of half a million. The city is a highly important industrial center and an important focal point for internal waterways, railroads, and highways serving all sections of France. Allied intelligence first believed that the Germans would defend the city at least temporarily. Because Lyon was an important point in the line of retreat, its defense would cover and secure the withdrawal. But German documents captured on 1 September revealed that there would be no defense of the city and, contrary to Allied calculation, that it would be completely evacuated as rapidly as the retreating column could move to the north. In view of the rapid advance of Allied forces

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

in northern France, the Germans had apparently decided to abandon the defense of the Lyon-Dijon-Besancon triangle.

A VI Corps field order of 31 August had directed that the 36th Division advance northward on Lyon with "utmost speed." At the same time the 45th Division was to concentrate in the Meximieux area, covering the Corps' right flank and remaining in position to attack northward to seize Bourg-en-Bresse. The 3rd Division, at Voiron, was to maintain liaison with the other divisions and be prepared to assist either of them. The maneuver was designed to place the VI Corps in position to encircle and capture Lyon.

In and about Lyon the strength of the French Forces of the Interior increased as the Allies approached. There were an estimated 4,000 FFI troops in the area. The resistance group planned to seize street cars, which were in car barns on the west side of the Saone River, and use them to block the narrow streets to prevent any withdrawal of the Germans along the west side of the Saone. The FFI wished to liberate Lyon completely with their own forces. However, General De Gaulle's military representative warned against "premature action." On 30 August the FFI at Lyon was given orders to be ready to establish contact with Allied columns, which were rapidly approaching the outskirts. The enemy was to be harassed but not actively engaged. An all-out attack was to take place only in cooperation with troops of the American and French armies.

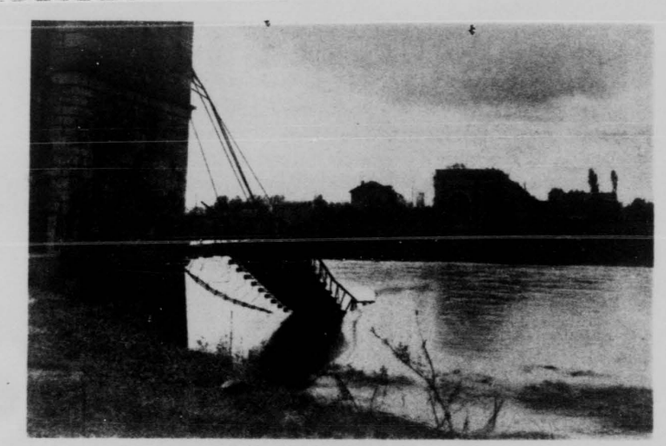
The advancing troops of VI Corps, east of the Rhone, found little to oppose their entry into the city. The Germans, harassed by the FFI, attempted only to defend a system of roadblocks east of Lyon until their troops could be pulled out. On the afternoon of 1 September the 142nd Infantry reached the hills overlooking Lyon. The enemy offered no opposition until American troops reached the flat ground before the city, and even there resistance was slight. Throughout the next day the 36th Division continued to occupy key positions east and southeast of the city, thus placing elements in position for the attack which had been planned in detail.

At 1130 hours on 2 September, General Dahlquist ordered an officer patrol to investigate French reports that Lyon had been

evacuated. Early in the afternoon the patrol reported that Lyon was clear, up to the Rhone River where the Germans were covering the approaches to the city by fire. At 1700 hours, General Butler instructed the 36th Division that it was not to enter the city of Lyon, but that officer patrols and liaison parties should be sent into the city to maintain contact with the FFI and French Army B approaching Lyon from the west. Pockets of Germans still held out between the Rhone and Saone, although the city had been virtually liberated. American troops were kept at the edge of Lyon in order that the French could claim the prestige of liberation. Then a small force, consisting of one platoon of infantry and one platoon of tanks, was placed at the mayor's disposal to "help keep order." In cooperation with the FFI this patrol neutralized the German pocket in the town's northeastern section between the two rivers.

Meanwhile, on the west bank of the Rhone, the French II Corps was moving up along two routes against practically no opposition. On 2 September reconnaissance elements reached the outskirts of the city without contacting the enemy. As the main body moved up, advance elements extended as far north as Villefranche, more than 15 miles above Lyon, and occupied high ground in that area. On 3 September the 1st French Infantry Division entered Lyon and deployed along the entire perimeter of the city west of the rivers. At the end of the day the division began to regroup to assure law and order; but this precaution was unnecessary, for all was calm.

While the French II Corps and the American 36th Division were engaged in and about Lyon, the American 45th Division was in contact with the German rear guard in the Meximieux area. The French were moving up the west bank of the Saone along Highway 6 toward Macon, Chalon-sur-Saone, and Dijon. The road junctions at Meximieux and Bourg-en-Bresse became of primary importance to the Germans for use in their withdrawal north through Besancon to the Belfort Gap. At Meximieux, on the road and rail net running northeast out of Lyon, the 11th Panzer Division was aggressively defending the flank of the retreating forces. By blowing bridges and establishing roadblocks the Germans hoped to keep the main body of the Allied forces south of the



THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Rhone and Ain Rivers. However, by 30 August advance elements of the 45th Division had already crossed both rivers and set up roadblocks at Meximieux, Lagnieu, and Amberieu.

BRIDGE BLOWN BY THE GERMANS

". . . By blowing bridges and establishing roadblocks the Germans hoped to keep the main body of the Allied forces south of the Rhone and Ain Rivers . . ."

Meximieux

On 1 September the 179th Infantry was left to block the road junction at Meximieux, while the rest of the 45th Division advanced up the east bank of the Ain paralleling the retreating German units on the west bank. There was little opposition to the northern advance of the 180th Infantry, but the holding force at Meximieux faced a different situation. There the German 11th Panzer Division was fighting vigorously to drive the 179th Regiment from the town. Using tanks, self-propelled artillery, and infantry the Germans broke through a roadblock five miles southwest of Meximieux on the highway from Lyon.

Intelligence reported they would attempt to retake Meximieux and push east into the 45th Division rear in order to cover the German flank. The 179th Infantry accordingly prepared to defend the town.

Shortly after 1000 hours on 1 September the Germans attacked with about 1,000 men, backed up by tanks and self-propelled guns. These were first-line units of the 15th Panzer Regiment and the 111th Panzer Grenadier Regiment of the 11th Panzer Division. The enemy fanned out and directed his attacks against American positions along the entire front. In the center of the defense line at Meximieux were the 1st Battalion, 179th Infantry, and FFI units, together with supporting tank destroyers and artillery. As the Germans approached, the 2nd Battalion, 179th Infantry, on positions near Chalamont north of Meximieux, was ordered back to assist the 1st Battalion in its defense of the city. Throughout the day the 3rd Battalion of the 179th Regiment successfully defended both banks of the Ain River, saving an important bridge east of Meximieux, in spite of constant enemy pressure.

The Germans' first attack on Meximieux from the northwest was repulsed. Attacks from the south followed. As these attacks mounted in fury, even kitchen and headquarters personnel were sent into the line. An enemy attempt to seize the railroad station was broken up by concentrated American fire coming from the station itself. At one point German tanks broke from the cover of the woods and raced across the railroad tracks into town. Several sped down the main street but were disabled by fire from tank destroyers. American infantry then killed or captured enemy tankmen before they could disperse.

During the afternoon of 1 September eight more tanks advanced down the main highway from the direction of Lyon. Backed up by artillery, FFI troops were dispatched to the southern sector to deal with this new threat. With the coming of darkness the Germans began to withdraw, leaving behind them destroyed vehicles and many dead. The enemy had suffered 350 killed or wounded, lost 41 prisoners, and had five tanks and three self-propelled guns destroyed. American casualties were surprisingly low, even though the enemy had cut all roads and encircled the town. The 1st Battalion of the 179th Infantry, which had

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

been in the thick of the action, reported only 11 casualties during the day's fighting. Though artillery and mortar fire continued throughout the night, by 0935 hours on 2 September Meximieux was declared secure.

The Race for the Belfort Gap

The rapid reduction of Lyon and the favorable conditions for continuing the pursuit of the fleeing Germans altered the original plans for a regrouping of Seventh Army according to the design of the Theater Commander. In the strictest sense the assigned mission of Seventh Army had been to land in southern France, capture Toulon and Marseille, and then exploit northward toward Lyon and Vichy. This primary mission had now been accomplished. Although Vichy had not been formally entered by Allied troops, its importance as a military objective no longer existed. Because of the favorable situation for continuing the pursuit of the German Nineteenth Army, the new mission of the Seventh Army was apparent.

Two likely escape routes from France lay open to the retreating Germans. They could advance up the Saone River Valley to Chalon-sur-Saone, then north to Dijon, and beyond to Chaumont or Epinal, and then to Nancy. This route would avoid the high Vosges Mountains to the east and would put at their disposition an excellent rail and road net. It would also be protected to some extent from the advancing American Seventh Army by both the Doubs and Saone Rivers. However, this entire route was being threatened by the eastward advance of the American Third Army toward Nancy.

A second route followed the Doubs River Valley northeast of Chalon-sur-Saone, between the Alps and the Vosges, extending northeast from Dole through Besancon and Baume-les-Dames toward Montbeliard. From there the main lines of communication pass through the Belfort Gap to Mulhouse and the Rhine. This route was more direct than that by way of Nancy, and by withdrawing along the northwest bank of the Doubs the Germans could utilize the river as an obstacle to protect their retreat from advancing units of VI Corps. Once the Germans were past Besancon, the Alps and neutral Switzerland would cover their southern

flank and the Vosges their northern. With their flanks secure, the Germans would have the choice of defending the line of the Vosges or escaping across the Rhine. It was probable that the enemy would make some use of both escape routes. Again it was the 11th Panzer Division which was designated to hold back the pursuing VI Corps troops and keep them south of the Doubs and Saone Rivers.

At approximately 0200 hours, 3 September, a special officer-courier arrived at the Seventh Army Command Post at Brignoles with an urgent message from General Truscott. The VI Corps Commander sent an estimate of the situation: The Germans were in full retreat, very much disorganized; and delaying actions at advantageous defensive positions were all that could be expected. The VI Corps, he continued, was in contact with elements of the 11th Panzer Division in the Bourg area and on the previous day had destroyed 15 enemy tanks. In view of this situation, General Truscott requested permission to continue the "relentless pursuit" of the enemy on the axis Lons-Le Saunier-Besancon-Belfort with the object of preventing his escape into Germany.

After a staff conference VI Corps was directed to continue the "hot pursuit" of the enemy northeastward to the Belfort Gap via Lons-Le Saunier and Besancon. French Army B was to complete the occupation of Lyon and thereafter to push up the northwest bank of the Saone on the line Dijon-Epinal with sufficient forces detached to protect the right flank of the Seventh Army. Later, General Sir Henry Maitland Wilson also concurred, in view of the fleeing nature of the opportunity, and agreed that a regrouping of the Seventh Army in accordance with SHAEF's plans could be temporarily delayed. General Truscott lost no time in putting this directive into execution.

By 3 September the 117th Cavalry Reconnaissance Squadron had reached Bourg-en-Bresse and Montrevel on Highway 75. During the night units of the 11th Panzer Division, withdrawing northward after the fight at Meximieux, entered Bourg-en-Bresse and a "free-for-all" followed. Almost all of the men of Troop B, 117th Reconnaissance Squadron, were killed or captured and their equipment lost, including 20 one-quarter ton trucks, 15 armored cars, and two light tanks. Although opposed by enemy armor and a number of heavy self-propelled

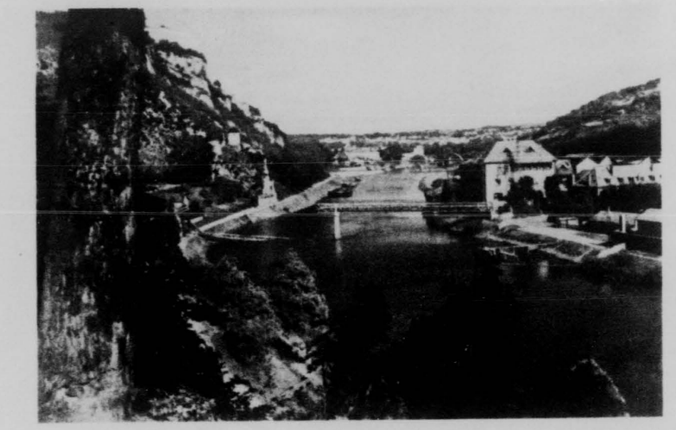
THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

guns, Troop B had fought gallantly and succeeded in inflicting heavy losses on the Germans. The following day, the 45th Division, having destroyed enemy holding forces at Pont d'Ain, on Highway 75, and at other points southeast of the city, occupied Bourg-en-Bresse.

After the occupation of Bourg-en-Bresse, VI Corps troops temporarily lost contact with the enemy. The 45th Division spearheaded the advance through Lons-Le Saunier, Poligny, and Mouchard toward the Doubs. North of Lons-Le Saunier columns encountered numerous road obstacles. Blown bridges forced detours over muddy trails. Supply lines were extended, and transportation facilities were inadequate. Lyon was more than 70 miles to the rear; and supply depots were still on the beaches, over 250 miles away. The entire VI Corps was advancing along one main route, and traffic became so heavy that halts were necessary to gain sufficient clearance between march units.



As the Germans approached the Doubs in their retreat, they turned and made a determined effort to halt the advancing VI Corps. They apparently hoped to hold Besancon until 15 September, so that the remaining German troops in the Dijon area would be able to escape through the Belfort Gap.

Crossing the Doubs

Besancon is a fortress built by nature and improved by generations of military engineers. An industrial city of about 80,000 people, it is also a key communication and supply center. The Doubs River makes a loop around the city's industrial heart. The main approaches are solidly guarded by a huge Vauban-designed fort, La Citadelle, which in turn is supported by four minor forts: Fort Tousey on the southwest, Fort des Trois Chatels to the southeast, and on higher elevations across the river Forts Bregille and Chaudanne. These fortifications, built in the 17th century, are extremely thick-walled, surrounded by moats and utilize high ground to command all avenues of approach.

On the north bank of the river, west of the city, are Forts Rosemont and De Planoise; directly south on a steep hill stands Fort le

Fontain; due east is Fort de Montfaucon. This system of redoubts was manned by an estimated 3,000 German troops made up of stragglers and elements from training units and battle groups, which the Germans were trying to reorganize as combat units. Since enemy movement through

BESANCON

". . . Besancon is a fortress built by nature and improved by generations of military engineers . . ."

Besancon was almost continuous, the strength and composition of forces defending the city could not be accurately determined by the VI Corps as it closed in from the south.

The bulk of VI Corps on 5 September was concentrated in the area east and southeast of the city. The 3rd Division had moved up from the rear to the center of the VI Corps line and was in position to assault from the south. The 36th Division occupied the area from Mouchard and Poligny to the northwest, and had orders to protect the Corps left flank. The 45th Division was moving rapidly northeast to

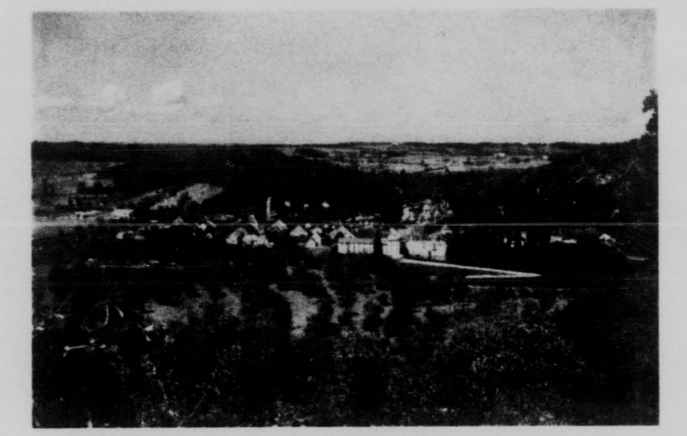
THIS PAGE IS UNCLASSIFIED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED



the Doubs River at Baume-les-Dames on the corps right flank. This maneuver threatened the enemy's escape route to the Belfort Gap.

The 3rd Division closed in on Besancon and occupied high ground on three sides. On the left flank below the city the 7th Infantry Regiment seized the Doubs bridge at Avanne and held positions along the river. A battalion of the 30th Infantry crossed the swamp lands northeast of Besancon and occupied the village and fort at Montfaucon. From this elevation tanks, tank destroyers, and artillery fired at enemy vehicles withdrawing along the Belfort Road. "I never saw such confusion in my life", reported a tank destroyer commander. "Germans were flying every way, ammunition going off and flares lit the place like the Fourth of July back home." The enemy continued to withdraw from the city, but left behind delaying forces of infantry armed with machine guns and mortars.

During the night of 6-7 September a battalion of the 15th Infantry took Fort Fontain and then cleared the southern approaches to the outer defense of Besancon. With supporting fire from machine guns, tanks, mortars, tank destroyers, and artillery, infantrymen from the 30th Regiment took Fort Tousey at 1315 hours, 7 September, and Fort Trois Chatels shortly afterwards. Fifty-four Germans, including one officer, were captured; and the remainder escaped to the citadel or were killed in flight. With the supporting forts out of action, the citadel was bombarded by artillery and mortars. After the barrage lifted, infantry crossed the moat and began scaling the walls, at which time the defenders indicated their willingness to surrender. Over 200 prisoners were taken. Elements of the 30th Infantry crossed the Doubs on a temporary foot bridge and found that part of Besancon north of the citadel clear.

While the assault on the citadel was in progress, the 7th Infantry, having crossed the Doubs River at Avanne, occupied the westerr outskirts of Besancon. Fort Rosemont and Fort Chaudanne fell by frontal assault to the 2nd Battalion. The regiment moved around the city to the northeast to cut all important roads and to clean out small pockets of enemy resistance. When the 7th joined with the 30th Infantry, advancing from the center of the city, the fall of Besancon was completed.

While the 3rd Division was engaged at Besancon, the 36th Division, on the corps left flank, was probing for crossings over the Doubs near the town of Dole 30 miles to the southwest. The division engineers attempted to construct a bridge, but heavy enemy fire from the opposite

AVANNE

"... The 7th Infantry crossed the Doubs River at Avanne..."

bank stopped all progress. In order to clear the enemy from the bridge site, the 143rd Infantry swung east in motor convoy, crossed over the Doubs at the Avanne bridge, which had been held by units of the 3rd Division, and began to clear the northern bank. Northwest of Besancon small enemy pockets were cleared out, but the most important aspect of the fighting was the capture of an enemy fuel dump containing 177,500 gallons of gasoline and 4,000 gallons of alcohol. In view of the shortage of motor fuel, this find proved to be of great significance.

The 141st Infantry also crossed at Avanne on 8 September and cut the highways leading west and northwest from Besancon. Tanks

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

from the 753rd Tank Battalion crossed to cover the flank and aid the infantry in extending the Doubs bridgehead. By the time the 142nd Infantry had secured both sides of a bridge site near Byans, 12 miles down the river from Besancon, work was begun on a class 40 trestle

SETTING UP 105MM HOWITZERS

". . . supported by . . . heavy artillery the infantry closed in for the assault . . ."

bridge, which after its rapid completion permitted armor and supplies to roll across into the newly-won bridgehead.

Northeast of Besancon at Baume-les-Dames the 45th Division also had crossed the Doubs. On 7 September troops of the 179th and 180th Infantry Regiments crossed the river by foot-bridge, barges, and ferry. The 2nd Battalion of the 180th Infantry entered Baume-les-Dames, but heavy enemy fire from tanks and machine guns stopped the advance and drove the battalion out. The 2nd Battalion continued to engage the enemy while the 1st and 3rd Battalions of the 180th crossed both above and below the town. The completion of this movement

seriously threatened German troops in Baume-les-Dames with encirclement. Therefore they began to withdraw on 8 September to prevent capture or annihilation. Supported by tanks, tank destroyers, and heavy artillery, the infantry closed in for the assault, and Baume-les-Dames fell during the early hours of 9 September. Farther upstream, at Clerval, the crossing of the 179th Infantry had been uneventful, because a heavy artillery barrage had driven the enemy from the opposite bank.

The entire 45th Division then attacked north toward the road junction at Villersexel. After nearly a month of long road marches and speedy advances the war of rapid movement came to an end. Movement now became slower, plodding every mile through hills and wooded terrain in the face of an alert enemy. The autumn rains had started. The streams were swollen, and the ground was becoming too soft for cross-country operations with armored vehicles and tanks. The Germans had now regrouped and, taking advantage of good defensive terrain, were fighting tenaciously.

Enemy units opposing the VI Corps assault, at Besancon and at the crossing of the Doubs, were advance elements of the 159th Reserve Division, evacuated from the Bordeaux area and with which contact had not previously been made. Other German troops included remnants of the same divisions which had faced the Seventh Army since D-Day. Though thousands of prisoners had been captured and vast stretches of territory had been liberated, the German High Command had been able to withdraw a considerable portion of its forces. As General Truscott explained, the mere liberation of territory did not mean the destruction of the German armed forces, for those who escaped one day would live to fight another. On 8 September the General issued the following order to the VI Corps:

> The purpose of this operation is to destroy by killing or capturing the maximum number of enemy formations.
>
> Therefore the following should be observed:
>
> a. Make every effort to entrap enemy formations regardless of size. Long range fires, especially artillery, will merely warn and cause a change in direction.
>
> b. All units, but especially battalions and lower units, must be kept well in hand. Commanders of all ranks must avoid wide dispersion and consequent lack of control.

CHAPTER XII

The Junction of Dragoon and Overlord

THE Seventh Army plan for sealing off the German troops in south and central France was being set and tightened by all its main assault forces. General Truscott's VI Corps was advancing from Lyon to the Doubs. General Monsabert's French II Corps pushed along the west bank of the Rhone and Saone, covering the Army's left flank and striking for a junction with the American Third Army. The French I Corps, under General Bethouart, moved northward in the eastern sector protecting the right flank. All possible effort was to be made to keep the enemy from slipping into Germany.

GENERAL BETHOUART
"... moved northward ... protecting the right flank ..."

The Swiss and Northern Italian frontiers were held by the 2nd Moroccan Infantry Division, and contact was maintained with the 1st Airborne Task Force in the coastal area of the frontier. The mountainous territory between the Swiss border and the advancing American units of VI Corps was cleared by the 3rd Algerian Infantry Division, which had moved up from Marseille, in conjunction with the 9th Colonial Infantry Division which had moved from Toulon through Grenoble. Seventh Army moved quickly to exploit its opportunities. The junction of DRAGOON and OVERLORD would constitute a significant victory for the Allied invasion of Fortress Europe. Succesfully trapping the retreating enemy forces would practically insure the complete liberation of France.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

On the Seventh Army's left flank the French II Corps had taken Chalon-sur-Saone, more than 70 miles north of Lyon, by 6 September. In the Army's center, American VI Corps units were preparing to cross the Doubs River at Dole, Besancon, and Baume-les-Dames. On 6 September troops of the French I Corps on the Army right flank occupied Pierrefontaine, Maiche, and St. Hippolyte, directly east of Besancon and along the Swiss border. On the following day these French troops reached to the north a point only ten miles from Mount Beliard on the Doubs and less than 20 miles from Belfort.

On 8 September the German Nineteenth Army struck back. Early in the morning an enemy column, including tanks, moved south from Montbeliard toward elements of the French I Corps along the Doubs River. Two other columns of the 11th Panzer Division attacked at Glay and Blamont, northeast of St. Hippolyte. The French were driven from their forward positions, and Glay was recaptured by the Germans.

This blow brought a halt to the race for Belfort and made possible the establishment of German defensive positions before the Gap. The retreat phase of enemy operations had come to an end, and the Germans were succeeding in their efforts to establish a front by executing a vast turning movement, which would bring their forces into line with other retreating elements to the north. The security of the Belfort Gap was the key to any future defensive line in the Vosges. The 11th Panzer Division, the most effective unit of the Nineteenth Army, was assigned the mission of stopping any Allied attempt to break through to the Rhine.

The attack near Montbeliard arrested the advance of the French and thus secured the German left flank. The Nineteenth Army was now occupying an east-west line, generally following the Doubs river, but its amorphous right flank was still exposed. The 159th Reserve Division was added to the enemy's order of battle on 6 September, when elements of the division were committed to the defense of Besancon. The 716th Infantry Division was committed at Chalon-sur-Saone in an effort to hold open an escape route for the estimated 100,000 enemy troops moving toward the Rhine from southwestern France. This retreating

mass included a miscellany of battle groups varying from company to brigade strength and constantly changing in composition as the enemy attempted to reorganize his lines. Whenever possible these battle groups were assimilated into the Nineteenth Army itself.

The Nineteenth Army executed its turning movement and absorbed the stragglers from the west simultaneously. It pivoted on the anchor position established before the Belfort Gap by the 11th Panzer Division and withdrew the center and right of its line from an east-west to a north-south axis, fighting delaying actions only at threatened points.

French II Corps Advances in the West

While the American VI and French I Corps were threatening the Besancon-Belfort escape route of the Germans, the French II Corps was pursuing the retreating enemy along the other escape route from Lyon to Dijon to Nancy. This Allied advance up the west bank of the Saone protected the Seventh Army's left flank and placed the French II Corps in a position to effect liaison with the American Third Army pushing southeast from Paris. On 3 September General Patch informed Colonel Agostini, Deputy Chief of Staff of French Army B, that a task force composed of French troops would shortly advance toward the northwest and effect a junction with the OVERLORD forces. The French II Corps, consisting of the 1st French Infantry Division and the 1st French Armored Division, was admirably adapted for this operation.

On 3 September air reconnaissance reported very heavy enemy movement on the Lyon-Macon-Chalon-Dijon route. Fighter-bombers attacked some 500 horse-drawn vehicles spotted north of Chalon, destroyed over 300, damaged others, and killed many enemy personnel. The same day French II Corps took Villefranche, north of Lyon, capturing 2,400 prisoners.

A captured document revealed that three battle groups of the German 716th Infantry Division were responsible for holding open the escape route through Chalon and Chagny until the German First Army could complete its withdrawal. The 716th Infantry Division, together with elements of the First Army's 16th Infantry and 159th Reserve

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Divisions, had the mission of delaying the Allied advance west of the Saone in order to allow the greatest possible number of German forces to escape from France. Reports indicated that some 100,000 men, most of them communication and service troops, were attempting to pass through the dwindling corridor between the forces of DRAGOON and OVERLORD.

On 5 September French II Corps troops overcame resistance and occupied Chalon-sur-Saone. French artillery continued to fire on enemy elements withdrawing north toward Beaune and Dijon. General Monsabert, Commanding French II Corps, received a memorandum from the Chief of Staff, Seventh Army, notifying him that the American VI Corps was still in contact with the 11th Panzer Division but that it appeared that the majority of the reinforced German Nineteenth Army, including the new 30th SS Infantry Division, was on General Monsabert's immediate front, although in greatly reduced strength. "I trust", wrote General White, "you will have no difficulty in driving this force northward to its final extermination."

GENERAL
GOISLARD DE MONSABERT
"...continued his advance north..."

The recently formed 30th SS Infantry Division contained many Russian, Ukranian, and Polish "volunteers." Only about ten percent of its personnel was German. Internal tensions and low morale became evident when, on 14 September, one battalion of Ukranians killed all its German officers and went over to the French Maquis.

The French II Corps continued its advance north. The 1st French Armored Division led the way toward Beaune, followed by the infantry and assisted by the FFI. West of Chalon two German trains with one gun, two tanks, and 600 prisoners were captured. On 8 September an armored advance guard entered Beaune and mopped up enemy resistance. While this operation was in progress, the enemy brought up an infantry battalion by armored train and attacked the left

flank of the French rear near Chagny. The attack was unsuccessful and cost the Germans 400 killed and 30 prisoners. Fanning out, the 1st French Infantry Division outflanked Autun, some 20 miles west of Chagny, from the north and had cleared the town by the end of the day.

Troops of the French II Corps raced to meet the American XV Corps of the Third Army. Only 25 miles separated the French from Dijon, and the fall of this important city would not only cut the chief enemy escape route but also outflank the Doubs line. On 9 September French armored elements reached a point on Highway 74 almost midway between Beaune and Dijon. Here the Germans attempted to hold firm and halt the advance. Another counterattack was launched into the flank of II Corps. However, this attempt failed and cost the Germans over 300 killed and many captured. An estimated 300 vehicles and 12 guns of different calibers were destroyed.

Seventh and Third Armies Join Forces

Dijon was invested and liberated by the 1st French Armored Division on 10 September. The Germans did not attempt to defend the city, and the capital of Burgundy fell into Allied hands undamaged. On their right flank the French contacted the 117th Cavalry of VI Corps at Auxonne, north of Dole, thereby establishing a continuous army front. During the night of 10-11 September an armored reconnaissance group operating west of Dijon met a patrol from the 2nd French Armored Division of the American Third Army. The meeting at Sombernon linked the Normandy front with that of southern France. Whether the trap was now closed, however, it was difficult to say. Large enemy forces were reported to be still west of Dijon.

The following day, 11 September, French II Corps armor continued to push northeast toward Langres. The infantry established a static defense line west of Dijon and prepared for any future enemy attempt to break out of the closing trap. Reconnaissance elements pushed out to the northwest of the Dijon-Langres highway.

At 0700 hours on 12 September, reconnaissance troops of the 1st French Infantry Division linked in force with an armored regiment

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

of the 2nd French Armored Division coming from Paris. Junction took place near Chatillon-sur-Seine on the road from Dijon to Troyes. Soon after the establishment of a continuous front, news arrived that German troops west of the Loire River had agreed to surrender to the American general commanding Tours. Thus the rapid advance of the American Third and Seventh Armies resulted in the capture of some 18,000 men, including three generals and one admiral. Surrendering Germans seemed to prefer capture by the Americans. However, the FFI did take over 1,000 prisoners in southwestern France, including General Mayer, former commander of the Toulouse area.

GENERAL LECLERC
"... from Normandy through Paris ..."

The 1st French Armored Division reached the southern outskirts of Langres on 12 September. Patrols reported the city free of the enemy except in the fortified citadel. Occupation of the town, however, was delayed by mines and booby traps. There was stubborn resistance at the citadel, and Langres was not completely mopped up until 1900 hours on 13 September.

GENERAL TOUZET DU VIGIER
"... from Provence through Lyon ..."

There was now a continuous front in strength from the English Channel to the Mediterranean. Less than a month after the D-Day of Operation *DRAGOON* two French armored divisions met in the heart of France. One, led by General Leclerc, had come from Normandy through Paris; and the other, under General du Vigier, had moved up from Provence through Lyon.

Inasmuch as the junction had been completed, the regrouping of the *DRAGOON* forces according to General Eisenhower's original plan, with the

Americans on the left and the French on the right, could now be accomplished. The advance of French II Corps to the north was suspended, and the Corps was directed to regroup to the east on the left of French I Corps and on the right of American VI Corps.

Villersexel

With the right flank of Seventh Army checked by the German defense of the Belfort Gap, the Army front changed from an east-west to a north-south axis, facing the Vosges Mountains. This fan-shaped realignment took place during the second week of September. The

BURNT-OUT ENEMY GUN ON OUTSKIRTS OF VESOUL
"... In the town of ... Vesoul ... the Germans made determined stands ..."

entire Army pivoted on the French I Corps, which held the extreme right flank. The 45th Division advanced north from Baume-les-Dames to Villersexel; the 3rd Division from Besancon to Vesoul; the 36th

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Division moved parallel to the 3rd on the left flank of VI Corps. The 117th Cavalry was assigned flank liaison missions.

Terrain and inclement weather operated against the Allied advance. The rolling foothills of the Vosges were admirably suited for delaying actions. Rain had softened the roads, and fog reduced possible air support. In the towns of Villersexel, Vesoul, Lure, and Luxeuil the Germans made determined stands. Their line of communications west of the Vosges was to be held open as long as possible in order to gain time to prepare the Vosges defense and complete regrouping.

After enemy resistance in Baume-les-Dames had collapsed, the 45th Division moved forward against increasing opposition. From

M-4 TANK DESTROYED BY GERMAN FIRE

". . . The enemy was employing mortars, tanks, and infantry to check any American move . . ."

Baume-les-Dames the axis of advance led north to Rougemont, Villersexel, and Lure. The enemy now began to use every possible device to

slow the Allied advance. Mines were laid, booby traps planted, and physical roadblocks constructed in profusion. The use of barbed wire and increased artillery indicated that the Germans were striving for some organized defense south of Villersexel. On the Doubs at Clerval they were employing mortars, tanks, and infantry to check any move on this pivotal position before Belfort.

At Rougemont the 180th Infantry captured quantities of valuable equipment, including nine locomotives, two dynamos, ammunition, guns, and trucks. Beyond Rougemont the enemy attempted to delay the advance with fire from machine guns, mortars, 20mm flak guns, and artillery. A flanking movement from the east combined with

SUPPLIES LEFT BY FLEEING GERMANS

". . . Infantry troops captured quantities of valuable equipment, including nine locomotives . . ."

a frontal attack broke the resistance. 100 prisoners, two guns, and numerous vehicles were taken. American infantry frustrated German

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

attempts to dig in south of Villersexel by using artillery to disrupt the defenses being set up. On the western flank of the division the enemy was especially sensitive, exhibiting sharp and immediate reaction to American patrols and showing signs of becoming progressively stronger. On 12 September the Germans counterattacked but were driven back with heavy losses, though they held out tenaciously in the wooded area south of Villersexel until division artillery made their positions untenable. On 13 September, in spite of enemy armored thrusts; the 180th Infantry secured possession of Villersexel.

The 45th Division advance was now almost brought to a standstill by determined resistance all along the front from L'Isle-sur-Doubs to Villersexel. On 14 September operations were hampered by drizzling rain and poor visibility, and for two days the division front remained static. On the 16th a combined infantry-tank assault on the German-held town of Geney, just north of L'Isle-sur-Doubs, proved unsuccessful; but the enemy counterattack in the late afternoon was repulsed.

The attack on Geney was not renewed. On 16 September the 45th Division was informed that it would be relieved by the French 1st Infantry Division, which was being transferred from the Army's left flank. The 45th would then assemble north of Vesoul and upon VI Corps order resume the attack on the axis St. Loup-Bains-Epinal. After the Division moved from the right to the left flank of VI Corps, it would become the contact point with the American Third Army to the north. The general advance was not to be resumed until 20 September, pending the transfer of the French II Corps from the left flank. On 18 and 19 September the French relieved American units by moving in on the Geney-L'Isle front. The 45th Division assembled and prepared for its shift to the north to secure a bridgehead across the Moselle.

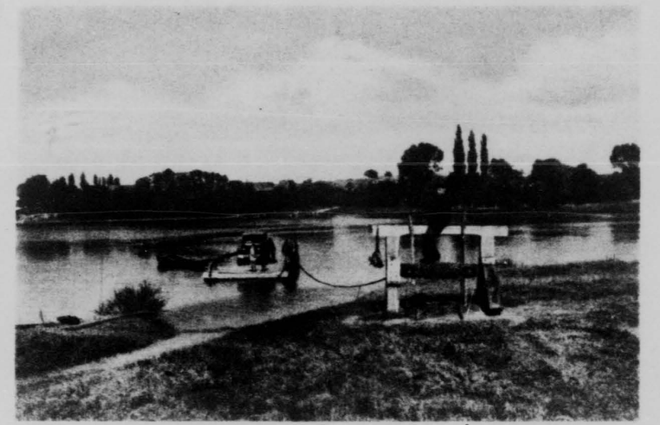
The Drive on Vesoul

While the 45th Division was covering the right flank of VI Corps and pushing from Baume-les-Dames to Villersexel, the 3rd and 36th Divisions were advancing northeast from Besancon to Vesoul. Enemy resistance had become determined and extensive. Roadblocks

were encountered on all main and secondary roads, and the troops had to make their way past demolished bridges and fallen trees protected by cleverly placed mines. The tenacity of resistance made it necessary to exploit every conceivable trail. The Ognon River, a tributary of the

BRIDGE BLOWN UP BY THE ENEMY
" . . . The troops had to make their way past demolished bridges . . ."

Saone, flows parallel with, and just to the north, of the Doubs. Bitter fighting took place north of Besancon to establish a bridgehead over the Ognon, but the Germans lacked both the necessary strength and artillery support to halt the advance more than temporarily.



At the Ognon River the 3rd Division found all bridges blown. An abandoned barge was improvised as a troop ferry, and on 9 September two companies of the 30th Infantry crossed. Some infantry forded the river in the face of heavy enemy rifle, machine gun, and mortar fire; and a blown bridge was made usable by the engineers. A mile downstream from the 3rd Division crossing, the 36th Division also crossed the river against moderate opposition.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

After crossing the Ognon the two American divisions continued to drive on Vesoul. The 3rd Division followed Highway 57, the main road from Besancon, while the 36th operated on the left, clearing towns and covering the road net to the west. By the night of 10 September

AMERICAN VEHICLE BEING FERRIED

". . . An abandoned barge was improvised as a troop ferry . . ."

the 36th Division, operating along the Dole-Vesoul Highway, had captured over 675 prisoners in this action.

A coordinated two-divisional assault on Vesoul was now planned. The 3rd Division was to attack the city from the south and southeast, while the 36th Division sent the 141st and 143rd Infantry Regiments up the two roads from Fretigney to move in from the west. Since Vesoul was the enemy's last direct road and rail hub west of Belfort, it was believed that he would defend the city strongly. The town has significant natural defenses. It is divided by a small stream and protected on the north by a high, dominating hill. For the defense of

the town the Germans had two main battle groups, one from the 189th Division and one from the 716th Division. They were supported by two or three battalions of mixed artillery and an unknown number of tanks.

German resistance at Vesoul did not materialize as expected. On 11 September the 141st and 143rd Regimental Combat Teams cleared the area west of the city and established contact with the French II Corps at Pont-sur-Saone. The 2nd Battalion, 143rd Infantry, successfully attacked positions on the hill mass north of Vesoul and cut the German escape routes. Meanwhile, the 3rd Division, advancing from Riez, had cleared the enemy from the area south of the city and extended east to cut the highway to Villersexel. There the 30th Infantry was covering the 45th Division's left flank and assisting in the reduction of Villersexel. The 15th and 7th Infantry Regiments outflanked Vesoul on the east, cutting the highways to Lure and Luxeuil. On 13 September, under pressure of a three-battalion attack, the German garrison in Vesoul surrendered without making the expected last-ditch stand. In addition to quantities of war materials, over 100 railroad cars, three of which were loaded with foodstuffs, were taken. The combined action of VI Corps units at Villersexel and Vesoul yielded over 1,300 enemy prisoners.

Luxeuil and Lure

The fall of Vesoul blocked the last direct escape route to Belfort in the VI Corps zone. However, to the northeast, Lure and Luxeuil still offered the enemy circuitous alternate routes. Junction with the 3rd Army in the Epinal area became necessary to deny the enemy those remaining roads. The German's primary consideration was to cover the organization and occupation of a defensive line being constructed in the Belfort Gap and through the Vosges. Agents reported an intensification of defense works in the Vosges, the strengthening of positions in the Belfort corridor, and a heavy movement of reinforcements. Farther to the north the enemy had bitterly resisted the Third Army's attempt to cross the Moselle.

Extrication of whatever forces remained west of Vesoul was

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

a minor problem for the enemy, to be considered only if it could be effected without endangering the combat forces holding open the routes north of Vesoul. After the VI Corps capture of Vesoul, stiff resistance was encountered northeast of the town, but there was little opposition to the northwest. The Germans continued to maintain their left flank as they executed a pivoting movement toward the Vosges Mountains. The terrain, the weather, and short lines of communications assisted these defensive operations.

The VI Corps directed the 36th Division to continue the pursuit of the enemy to the northeast with Luxeuil as the main objective. Contact was to be maintained with the French II Corps along the Saone River. The 3rd Division was directed to advance on the Vesoul-Lure-Belfort axis and to occupy Lure and positions on the left flank of the Belfort Gap. As the 3rd Division completed the occupation of Vesoul, the 36th on 12 September executed the necessary regrouping to advance on Luxeuil.

The regimental combat teams of the 36th Division advanced in three columns north from Vesoul to accomplish their mission. The 143rd Infantry advanced from positions at Pont-sur-Saone, north along the Saone River, and turned east to approach Luxeuil from the west. Advancing on the division center, the 141st Infantry followed the railroad and highway due north from Vesoul and turned northeast on secondary roads. The 142nd Infantry, on the division right, advanced along the main highway from Vesoul through Saulx to Luxeuil. The movement was slow, as the heavily-wooded country and an extensive road and trail network encouraged enemy infiltration. Enemy opposition took the form of small combat groups, which were often difficult to extricate from well-prepared timber roadblocks.

By the night of 15-16 September the approach march was completed. The 143rd Infantry was holding the woods west of the city and had cut the highway to the north; the 142nd had reached the outskirts of Luxeuil from the south and southeast, cutting the highway to Lure. At 0930 hours on 16 September the 143rd entered the town from the southwest. Resistance was light, and all fighting ceased by 1100.

In the Corps center, between the 45th Division at Villersexel and the 36th at Luxeuil, the 3rd Division advanced on Lure from the

west and southwest. The 15th Infantry followed Highway 19, the main road from Vesoul to Lure, which formed the northern side of the Vesoul-Villersexel-Lure triangle. The 7th Infantry cleared the center of the triangle, moving directly to the Villersexel-Lure Highway, then turning northeast to approach Lure from the south. On the division right flank, the 30th Infantry moved southeast, cleared the area northwest of Villersexel, and advanced on Lure east of the highway. Because the area had to be cleared of snipers and roadblocks, the operation was slow. On the morning of 16 September the 3rd Division was in position to attack Lure from the west and south, and the 15th Infantry occupied Lure during

MARCHING IN WET CLOTHES

". . . The 3rd and 36th Divisions continued toward Remiremont and the Moselle . . ."

the day without serious opposition. However, as at Vesoul and Luxeuil, a large portion of the Germans made good their escape to the northeast.

After the fall of Luxeuil and Lure, the 36th and 3rd Divisions continued to attack toward Remiremont and the Moselle. The 7th In-

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

fantry, 3rd Division, established roadblocks east of Lure on the Belfort road, while the remainder of the Division pushed north on the right flank of the 36th. Resistance similar to that encountered during the preceding week was met. Nevertheless, on 16-17 September, the Germans were pushed back another five to seven miles. But the VI Corps forward line was still more than 15 miles from the Moselle, when the advance had to be halted while awaiting the relief of the 45th Division by French II Corps and the regrouping of the Corps front. Until the advance was resumed, the divisions were to maintain an aggressive defense. Intensive artillery preparations preceded the vigorous patrols sent out. Every

AMERICAN PATROL SEEKING OUT THE ENEMY

". . . Every effort was being made to maintain contact with the enemy . . ."

effort was being made to maintain contact with the enemy and simulate an advance; all key positions found unoccupied were to be occupied, and all actions were to be directed toward keeping the enemy off balance and making him believe attack was imminent.

Transfer of Command

After the failure to capture Belfort early in September, the VI Corps pursuit had gradually slowed down and changed into a mopping-up operation. Any considerable advance in strength had to be postponed until adequate lines of communication were established. During this temporary lull Seventh Army forces were regrouped according to General Eisenhower's desire, and command of the DRAGOON forces was transferred from the North African to the European Theater of Operations.

Headquarters Sixth Army Group, originally designated as Advance Detachment, Allied Force Headquarters, under the command of General Devers, had been activated on 1 August 1944. After the visit of General Wilson on 4 September General Devers flew to the forward Command Post of Supreme Headquarters, Allied Expeditionary Force, to confer with General Eisenhower. General Eisenhower expressed high praise and approval of the planning and execution of Operation DRAGOON and cited reasons why Sixth Army Group should shortly take over command in southern France. September 15 was mentioned as the probable date of assumption of operational control of DRAGOON.

General Wilson, Supreme Allied Commander, Mediterranean Theater, notified General Eisenhower on 4 September that:

> I had thought that SHAEF would assume operational control of Seventh Army on the resumption of the pursuit north from Lyons. However, I am convinced that this should not operate to delay operations. Therefore, I propose to keep operational control of these operations until the establishment of signal communications make it possible for SHAEF to take over this responsibility. In the interim, I invite SHAEF to communicate his wishes to me direct and I shall be guided by his desire insofar as possible.

As the junction of the two forces approached, General Eisenhower instructed the Commanding General, Twelfth Army Group, on 7 September, as follows:

> It is important that a point of junction be fixed between Third and Seventh Armies. Desire therefore that you send your representatives or direct Patton to send his representatives to *concert* measures with

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Patch and decide upon a mutually agreed course of action. Decisions reached should be reported in on *agreed* cable to Wilson and this headquarters.

On that same day General Devers returned from his conference with General Eisenhower and visited the Seventh Army Command Post at Grenoble, where he acquainted General Patch with the agreements reached with General Wilson and General Eisenhower. General A. R. Wilson, Base Section Commander, also visited the Command Post to discuss the responsibility for rear areas. It was decided that at 0001 hours, 10 September 1944, the Coastal Base Section would be redesignated Continental Base Section and would assume control of the area south of a line Moulins-Macon-Bourg-Geneva.

The initial contact between the two forces occurred on 11 September. Between 11 and 15 September representatives of Sixth Army Group Staff, using a C-53 transport plane and a fighter escort of four P-51's, visited Allied Force Headquarters, North African Theater of Operations, at Caserta, Italy; Supreme Headquarters, Allied Expeditionary Force, Advance Command Post at Gronville, France; European Theater of Operations in Paris; and Twelfth Army Group Headquarters at Versailles. These visits were for the coordination of mutual problems which would result from operational control of Sixth Army Group by one command, while logistical support was being furnished by another. Prior to these conferences, information as to the current employment and plans of Seventh Army was furnished G-3, Sixth Army Group, by Seventh Army.

On 11 September General White, Chief of Staff, Seventh Army, accompanied by the Assistant Chiefs of Staff, G-2, Colonel W. W. Quinn, and G-3, Colonel John W. Guthrie, departed for Paris by air to coordinate plans for the meeting of Seventh and Third Armies. The junction in force took place two days later. On the afternoon of 13 September a conference, attended by representatives of French Army B and American VI Corps, was held at the Seventh Army Command Post. Details were worked out for the regrouping of the French on the right flank of VI Corps. Since VI Corps was at Vesoul, the road net north of the Doubs was open for the transfer. On 14 September Seventh Army

GENERAL JACOB L. DEVERS

"... At 0001 hours, 15 September 1944 Sixth Army Group became operational ..."

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

issued Field Order No. 5, setting forth in detail the procedure for regrouping French Army B.

As directed by General Wilson, at 0001 hours, 15 September 1944, Sixth Army Group became operational. The command included all Allied ground and service forces in the DRAGOON area with the exception of base section units. At the same time the responsibility for Operation DRAGOON passed from Supreme Allied Commander, Mediterranean, to Supreme Headquarters, Allied Expeditionary Force. Caserta and the Mediterranean scene were now history. Seventh Army had linked the two fronts.

On the afternoon of 15 September General Patch flew to Lyon to confer with General Devers. At a meeting the next day it was announced that Sixth Army Group would not actually take over control immediately, since General Devers intended to wait until Seventh Army's activities had been coordinated with those of Supreme Headquarters, Allied Expeditionary Force, and until projected operations had received approval of that headquarters. Seventh Army continued to exercise operational control over French Army B until further notice and continued to direct handling of logistical support of the operation. However, Sixth Army Group relieved Seventh Army of the responsibility for civil affairs in southern France. The transfer was gradual. General Devers made it clear that Sixth Army Group would interfere as little as possible and cooperate in every way.

A conference held at Lyon on 19 September between representatives of the Twelfth Army Group, Sixth Army Group, Third American Army, and Seventh American Army, discussed plans for the future operations of the Allied forces in eastern France. No agreement was reached as to the boundaries between the two Army Groups; General Devers' Sixth Army Group zone remained too wide for the forces available. The same day French Army B was redesignated First French Army and passed to Sixth Army Group control. The French Operational Mission departed from Seventh Army Headquarters on 21 September to be attached to Sixth Army Group. Seventh Army, reduced in size to one corps of three infantry divisions and with 35 days of continuous battle and progress behind it, prepared to cross the Moselle River.

CHAPTER XIII

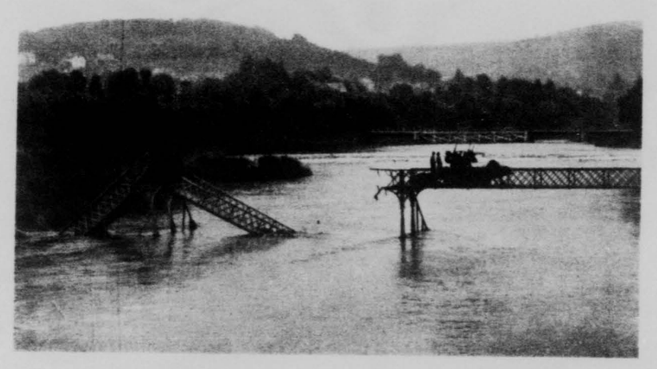
The Moselle

DURING the latter part of September the tactical plans of the Seventh Army were changed to meet a new situation. For the first time since D-Day the Allied advance met an organized foe, entrenched in prepared defensive positions forming an established line. The enemy supply lines were shortened; his ranks had been reinforced; and he occupied positions on terrain that was favorable for defensive action.

German defensive operations were expected to take advantage of the terrain along four major phase lines: 1) Delaying action at advantageous positions between the Doubs and Moselle Rivers. This action had already been carried out with sufficient success to make the subsequent strategy possible. 2) A defense of the western approaches to the Vosges. 3) A defense of the reverse slope of the Vosges overlooking the Rhine, and 4) defense of the eastern bank of the Rhine River itself. As the Rhine was the last natural barrier before Germany, the enemy was expected to make maximum use of the defense in depth afforded by the Vosges Mountains.

The Vosges Mountains are divided into two chains: the High Vosges and the Low Vosges, with the Saverne Gap separating the two. North of the Saverne Gap are the Low Vosges with steep, heavily forested hills; and south of the Gap are the High Vosges, a northeast-southwest range which forms a major obstacle to the Plain of Alsace and the Rhine River. At the southern end of the High Vosges is the Belfort Gap, the main avenue of approach to the Plain of Alsace. Epinal, on the Moselle River, is a pivotal communications center and the largest town in the High Vosges region, having a peacetime population of 27,408. Two major routes from Epinal pass through the Vosges, one through

THIS PAGE IS DECLASSIFIED IAW EO 13526



THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

St. Die and the Saales Pass to Strasbourg and the Rhine, the other through Gerardmer and the Schlucht Pass to Colmar and the Alsace Plain.

For the VI Corps to reach the Vosges it was necessary to cross the Moselle. At Epinal the Moselle River, 80 feet wide with 20 foot vertical walls on each side, presented a formidable obstacle. Above and below Epinal, the river, less an obstacle, was in some places even fordable. Between Remiremont and Le Thillot the width averaged 50 feet and the depth, except in pools, only a few feet. The bottom, composed of rock and gravel, was usually firm. Along many sections the banks were not

AMERICAN RIVER GUARDS

". . . At Epinal the Moselle River, 80 feet wide with 20 foot vertical walls on each side, presented a formidable obstacle . . ."

more than three feet high, and the terrain flat and fairly solid except in places softened by recent rains. The enemy was expected to take advantage of the Moselle as a natural obstacle behind which to establish some kind of defense line.

On 1 September one report stated, "There is evidence of German resistance along the Belfort-Vosges line. All barracks in Alsace and Baden completely filled with troops. Strong concentrations of artillery in Epinal and other garrisons in northeastern France." A week later it was reported that "work on fortifications had been under way for several days in great haste along the whole crest of the Vosges. Antitank guns, automatic weapons, cases of hand grenades, munitions, and food supplies are brought to aid the important points in the Vosges." On 19 September VI Corps G-2 warned that the "Vosges Mountains will make an excellent position from which to defend and it is doubtful that the enemy will evacuate without being forced to do so." The southern part of the enemy's long line from the North Sea to the Swiss border had the natural defenses of the Vosges backed by the Siegfried Line. It was calculated that fewer German divisions would be required for defense of the sector between the Swiss border and Strasbourg than would be needed on an equivalent sector farther north. The German Nineteenth Army was still opposite the American Seventh Army.

Seventh Army completed regrouping on 20 September. During the preceding two days forces of the First French Army had relieved the American units in the Villersexel area. The 45th Division now moved into a line facing the Moselle River opposite Epinal. This position, between the 36th Division and the XV Corps of the American Third Army, constituted the Seventh Army's left flank. The Seventh Army now occupied a zone approximately 12 miles wide separated on the northeast from the Third Army by the towns of Darney, Epinal, and Rambervillers, and on the southeast from the First French Army by Lure, Melisey, and Le Thillot. Patrol and reconnaissance actions during the aggressive defense period indicated that the Germans were withdrawing beyond the Moselle. The towns of Plombieres-Les-Bains and Xertigny had been evacuated by the enemy, and on 20 September the units of the VI Corps were in position to resume the assault.

At 1900 hours on 20 September General Truscott issued orders outlining the Corps plan of advance. The Moselle was to be crossed in order to obtain the key communication centers in the Vosges which would open a passage to the Alsatian Plain and the Rhine. The 45th

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Division, on the left, was to seize Epinal and secure a crossing in that vicinity, then advance northeast to seize Rambervillers and Baccarat, eventually to force open the Saverne Gap. The 36th Division, in the center, was to cross the Moselle in the Eloyes area and advance without delay to seize St. Die near the Saales Pass. On the right flank, the 3rd Division was to secure crossings over the Moselle in the Rupt area and advance to seize Gerardmer near the Schlucht Pass. The 45th Division was to maintain liaison with the Third Army and the 3rd Division was to maintain liaison with the French First Army, both to protect the Corps flanks. Upon arrival on the line Rambervillers-St. Die, the VI Corps was to continue its advance with its weight on the axis Baccarat-Sarrebourg through the Saverne Gap to Strasbourg. The enemy, dug in northeast of the Moselle and in the Vosges, was prepared to oppose this maneuver; and two months passed before the final mission was accomplished.

The 36th Division Crosses at Eloyes

In the center of the VI Corps zone the 36th Division was scheduled to make the first crossing of the Moselle in the vicinity of Remiremont. Civilians reported a ford just south of Eloyes, five miles north of Remiremont. This ford had a rocky bottom, with water only waist deep, a slow current, and with a wooded bank to cover the approach of vehicles. General Dahlquist ordered a reconnaissance made all along the river. The division plan was to send the 141st Infantry Regiment to locate the ford, to secure a crossing, and to move north toward Eloyes followed by the 143rd Infantry. The 142nd Regiment was to advance through the Forest of Humont and take the town of Remiremont, on the west bank of the river. As early as 18 September river crossing equipment was being brought forward, and by the night of 20 September 65 assault boats had arrived in the 141st Regimental area and 25 DUKWs were en route. An armored treadway and infantry support bridge materials were assembled, and the division was ready for the crossing.

The 141st Infantry began the reconnaissance in force of the proposed crossing area during the afternoon of 20 September. The 2nd

Battalion reconnoitered the northern salient of the river near Eloyes, the 1st Battalion the center area opposite the reported ford, and the 3rd Battalion employed diversionary missions to distract the enemy. Shortly after 1400 hours Colonel Clyde E. Steele, Commander of the 141st Infantry, reported to General Dahlquist that chances were good for a crossing near Eloyes since no enemy activity was apparent at Longuet, about midway between Remiremont and Eloyes, and there was excellent observation available from the high ground 1,000 yards southwest of Eloyes. The Division Commander ordered the 141st Regiment to cross that night and secure Eloyes and the high ground around it. The 143rd

AMERICAN TANK CROSSING MOSELLE

". . . This ford had a rocky botom, with water only waist deep, a slow current, and with a wooded bank to cover the approach of vehicles . . ."

Regiment was to then pass through the 141st as soon as a bridgehead was secured.

The troops were guided through the dense wood between Raon-aux-Bois and the Moselle by the 60-year old Mayor of Raon-aux-Bois,

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Monsieur R. M. Gribelin, a retired French Naval officer. He had often visited his daughter in Eloyes and to save a mile he would make his way through the forest. He was one of the few men who could successfully locate a route away from the roads and known trails where the Germans might discover the attempted river crossing. The night was cloudy and it rained intermittently, which added to the difficulties of guiding the troops. At 0030 hours on 21 September the 131st and 155th Field Artillery Battalions commenced firing on enemy positions across the river, and at 0500 hours radio silence was broken to determine the location of the 2nd Battalion of the 141st Infantry. The 1st and 3rd Battalions were headed for the ford site, and as dawn approached, all operations were obscured by fog in the river valley.

Shortly after 0700 hours the 1st Battalion, 141st Infantry, crossed the river and began advancing northward along the east bank. The leading elements encountered no opposition but the enemy soon became alerted and slowed down the advance with concentrated small arms fire. At 0914 hours, 21 September, the 1st Battalion called for additional mortar and grenade ammunition. The 3rd Battalion was still on the west side of the river.

At 0944 hours the Division Commander arrived at the fording site and ordered the 3rd Battalion to cross immediately. The engineers were ordered to get assault boats to the fording sites to carry ammunition to the 1st Battalion, and to bring back the wounded.

Leading two platoons of I Company, the 3rd Battalion Commander attempted to cross south of the 1st Battalion's fording site at a point where both sides of the river were devoid of cover for several hundred yards. The Germans waited in prepared machine gun positions on a densely wooded hill east of the river and allowed the first platoon to cross and start up the slope. Then they opened fire, killing or capturing all the platoon. The second platoon managed to escape with heavy casualties. The Battalion Commander was reported missing, and his S-3 killed in this action. As a consequence, the 3rd Battalion moved north to the fording site used by the 1st Battalion, and General Dahlquist ordered Colonel Steele to take personel command of the Battalion, to cross and expand the bridgehead. Meanwhile, the 2nd Battalion had

cleared that part of Eloyes west of the river, but all three bridges had been blown. Here the current was swift, and all sites were covered by enemy small arms fire. The battalion was to remain in position and engage the enemy across the river, while the 143rd Infantry crossed below at the original ford site to attack Eloyes from the southeast.

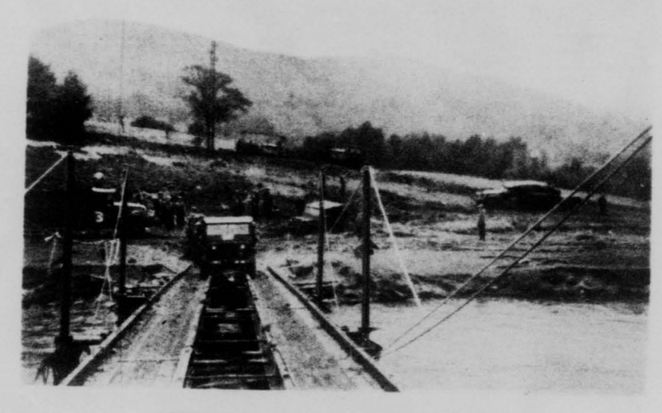
The 143rd Infantry had moved from Luxeuil to Raon-aux-Bois to exploit the crossing over the Moselle by the 141st. At 1515 hours on 21 September, troops of the 143rd Regimental Combat Team began to cross the river in a column of battalions. They were opposed by scattered small arms fire. Having crossed the river, the 3rd Battalion moved east

BLOWN BRIDGE AT ELOYES

All three bridges had been blown up by the Germans

of Eloyes and before nightfall had seized the Hill 783 (altitude in meters) overlooking the town. The 1st Battalion attacked its objective, Hill 605 (altitude in meters), southeast of Eloyes, while under enemy artillery, mortar, and machine gun fire. The Germans, approximately one bat-

THIS PAGE IS DECLASSIFIED IAW EO 13526



THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

talion in strength, engaged the American infantrymen in a fierce fire fight during the night of 21-22 September from a series of strongpoints along the axis Eloyes-Hill 605. The enemy shelled American positions, and fog made it impossible to locate the enemy guns. During the same night a company of Germans had infiltrated from Hill 605 into the 1st Battalion's positions, and at dawn of the 22nd bitter hand to hand fighting raged until the Germans were cleared out.

By this time Company A of the 111th Engineer Battalion had completed an infantry support bridge at the ford site. The first vehicles began crossing the Moselle. Cannon Company, 143rd Infantry, one of

VEHICLES CROSSING THE MOSELLE

"...Company A of the 111th Engineer Battalion had completed an infantry support bridge..."

the first to cross, moved up in close support of the 1st Battalion and laid direct fire on the enemy troops before Eloyes and on Hill 605. During the afternoon of 22 September the 143rd Regiment attacked the town;

after five hours of hand to hand fighting the town was cleared of most of the enemy.

While the 141st and 143rd Regiments were securing the bridgehead over the Moselle for the 36th Division, the 142nd occupied Remiremont, west of the river. It had moved from Luxeuil through Fougerolles and Plombieres and had sent the 3rd Battalion ahead to reduce the fort west of the town while the 1st and 2nd Battalions closed in from the south.

On 20 September the 3rd Battalion, followed a covered approach along the Forest of Humont, encountered and reduced a roadblock over 100 yards in depth. The road to Remiremont ran through a defile and the enemy occupied the northern ridge in the vicinity of an old fort overlooking the routes into town. One company was ordered to clear the enemy out with a flanking movement to the left. No fire was received from the fort, but the area around it was well covered. When it was reached, the fort was found unmanned. Company L gained the high ground overlooking Remiremont and, although hemmed in by fire from three sides, effectively supported the slow, steady advance of the battalion into town. Artillery and mortar fire was directed from this high ground on enemy vehicles attempting to escape across the bridge north of town.

The 1st and 2nd Battalions were advancing from the south. The 2nd Battalion reduced two roadblocks and then followed a secondary road through a deep defile. Steep slopes covered with woods and dense underbrush rose on each side. The heavy forest prohibited the effective use of artillery and mortars, separated the advancing infantry files, and encouraged enemy infiltration. In the confusion of a daylight attack by the enemy on the morning of 21 September, part of E Company was lost; and F Company was forced southeast into the 1st Battalion area. The 1st Battalion, in the Forest of Herival, south of Remiremont, had encountered and passed 16 roadblocks. By nightfall of the 21st, the 1st and 2nd Battalions were in position to assault the town. The 3rd Bat-Battalion, harassed by sniper fire, had taken a small portion of western Remiremont. By morning of 23 September the Germans had withdrawn,

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

except for rear guard elements; and the 142nd Infantry had neutralized an anchor of the enemy's organized defense line overlooking the Moselle.

At 0645 hours on 22 September the 1st and 3rd Battalions, 141st Infantry, had been withdrawn from their positions at Eloyes and were directed to move south to assist the 142nd Infantry in trapping and liquidating the Germans around Remiremont from the east side of the Moselle. The 2nd Battalion of the 141st Regiment remained in its positions in the western part of Eloyes. At 0800 hours it was attached to the 143rd Infantry on division order. The 143rd Infantry, reinforced, finished mopping up in Eloyes during the day of 22 September. The

MOVING UP TO THE ATTACK

"... The 141st Infantry was directed to move south to assist the 142nd Infantry ..."

next morning it was ordered to move up a secondary road north from Eloyes to seize and clear Docelles, a reported focal point of enemy strength. While the 143rd Infantry was engaged in clearing Eloyes on

22 September, the 141st Infantry, less its 2nd Battalion, moved south along the eastern bank of the Moselle.

After occupying hills east of the Moselle and overlooking Remiremont the 141st Infantry secured a bridge site and cut the eastern escape route of Germans still fighting in the town. A patrol was sent across to contact the 142nd Regiment, now busy cleaning out the town of Remiremont opposite the bridge site. Street fighting continued in Remiremont during the morning of 23 September, as the German rear guard elements withdrew and fought delaying actions. By noon enemy resistance was broken and sniper fire had ceased. The 36th Engineer

talions across a temporary ponton bridge. Recent rains had swollen the river and approaches on both sides were so deeply rutted and mired that it was impassable for traffic heavier than one-quarter ton vehicles.

By 24 September the 36th Division had succeeded in crossing

ENGINEERS WORKING ON PONTOON BRIDGE

"A heavy pontoon bridge constructed at Jarmenil insured communications for heavy traffic irrespective of weather conditions . . ."

the Moselle and in establishing a firm bridgehead from Remiremont north to Jarmenil, about two miles northwest of Eloyes. The Bailey bridge at Remiremont and a heavy ponton bridge constructed at Jarmenil insured communication for heavy traffic irrespective of weather conditions. The division advance and build-up continued while the remainder of VI Corps crossed at locations above and below.

The 45th Division Crosses at Igney and Arches

To the north of the 36th Division, the 45th Division was making its own advance to cross the Moselle and to secure a bridgehead.

By 19 September relief of the 45th Division had been completed and its sector on the approaches to Belfort had passed to the control of the 1st French Infantry Division. The 45th Division moved north to its new zone, southwest of Epinal, and prepared to resume the attack. Plans called for the 157th Infantry Regiment to cross on the left between Epinal and Chatel-sur-Moselle, the 180th in the center at Epinal, and the 179th on the right at Arches. One company of the 120th Engineer Combat Battalion, the division engineers, was placed in support of each Regiment. VI Corps also furnished additional engineer support. The 2nd Battalion, 36th Engineer Combat Regiment, with two bridge trains, was attached to the division. One train consisted of 130 feet of Bailey bridge loaded on DUKWs, five units of infantry assault bridge, and eight 10-man rubber assault boats; the other train, of 240 feet of treadway bridge. Both trains were in a preliminary assembly area at Bains-les-Bains by nightfall of 21 September. The engineers were then in position to support the infantry crossings.

The 157th Regiment was to be on the northern flank of the division, occupying a key position between the Third and Seventh Armies. On 19 and 20 September the regiment shuttled approximately 80 miles, moving through Bains-les-Bains to the vicinity of Darnieulles, northwest of Epinal. Patrols were sent along the river to find undamaged bridges or fordable points. Fortunately, a bridge built by the American XV Corps at Chatel was available, altough it was inside the Third Army sector. The night of 21-22 September the 1st Battalion, with two platoons of tanks, one platoon of cannon company, and one platoon of 57mm antitank guns attached, shuttled across the Chatel bridge, detrucked, and assembled at Vaxoncourt, almost two miles southeast of Chatel.

The 3rd Battalion, 157th Infantry, was to clear the town of Thaon, midway between Chatel and Epinal, then cross the Moselle in the vicinity of Igney. After several enemy roadblocks had been overcome and Thaon had been heavily shelled, patrols moved into the town during the night of 21-22 September. The battalion waded the Moselle at a point near Igney; armored and artillery support crossed at the Chatel bridge and rejoined the unit on the east side of the river. Attacking

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

south, the Americans caught the enemy off guard, and in a two-hour fire fight before dark on 22 September drove him back with heavy casualties. The men of the 3rd Battalion dug in for the night. The 2nd Battalion, meanwhile, had crossed the river at Chatel and attacked southeast toward Domevre, where it was held up through 24 September by determined enemy resistance.

To expand the bridgehead, the 1st Battalion, 157th Infantry, on 23 September, pressed southeast up the Moselle Valley toward Hill 375 (altitude in meters) near the town of Girmont and at this point received intense fire. Tree bursts took their toll as the infantry attempted to clear the woods on the slopes of Hill 375. On 24 September resistance from the hill still prevented entrance into Girmont. During the afternoon Company B forced its way up the height and broke the German resistance. Groups of Germans attempted to cross the northwest slope of the hill from Girmont and were promptly pinned to the ground by heavy fire. The 3rd Battalion gained important ground in a strategic position on the west side of the town. Fighting back only spasmodically, the Germans retreated in disorder, and suffered heavy casualties when they attempted to race across the open ground. Two companies, aided by armor, pushed in toward Girmont against intense fire. The town was entered at 1500 hours and by nightfall resistance had been cleared.

After the 157th Infantry had reached Igney on 22 September the engineers made reconnaissance for crossing sites. As tactical considerations did not require vehicular bridges, only ford sites were considered. After 3rd Battalion armor had crossed at Chatel and worked back to the foot troops who had waded the river at Igney, enemy pressure on the far bank lessened and construction could now proceed. Company A, 120th Engineers, on the morning of 22 September, developed a ford at Igney, capable of carrying all regimental vehicles.

While the 157th Infantry Regiment pushed its way across the Moselle at Igney and fought against the enemy north of Epinal, the 179th Regiment forced its passage of the river at Arches, some five miles southeast of Epinal. Preliminary reconnaissance along the river on 20 September, revealed that the Germans had blown all bridges across the Moselle between Epinal and Arches. On 21 September patrols of the

179th Infantry continued to reconnoiter possible crossings of the river, as battalions came into position between Arches and St. Laurent, some four miles to the northwest. During the afternoon supporting engineers brought up assault boats and bridging materials. Patrols moving along

ASSAULT BOAT CROSSING THE MOSELLE

". . . The 157th Infantry pushed its way across the Moselle at Igney and fought against the enemy north of Epinal . . ."

the western bank of the Moselle encountered intermittent small arms fire from across the river.

At 0400 hours on 22 September Company L attempted a crossing near Arches but was withdrawn under intense mortar fire. The advance patrol suffered 27 casualties. Company I got one assault boat across unopposed, but the swift current greatly handicapped transportation of troops. However, by 0615 hours all men of Company I had reached the eastern bank near Archettes and were moving toward high ground. Troops of Company L followed and secured the town of Archettes.

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

The 2nd Battalion followed the 3rd across the river, running into some small arms fire. By 1330 hours the engineers had completed a bridge at Arches. The Regimental Commander crossed the river and established his command post in Archettes. During the night, 22-23 September, the 1st Battalion, less Company A which was still in contact with the enemy near St. Laurent, crossed the Moselle and was immediately dispatched to hold down the right rear. The 2nd and 3rd Battalions advanced abreast toward Mossoux, two miles northeast of Archettes. At 0630 hours on 23 September the 2nd and 3rd Battalions jumped off, while behind them organic transportation and supplies poured across the river. Enemy artillery fire was checked by counter-battery action, as the 3rd Battalion entered Mossoux and the 2nd Battalion cut the road leading northwest from the town. Mine fields, booby traps, and trees felled across the roads slowed the regimental advance.

On 24 September the 179th Infantry continued to make limited progress while consolidating the bridgehead behind the front. Although fire fights occurred, enemy infantry to the north and northwest of Mossoux generally chose to withdraw when engaged by advancing troops. To the north the 157th Infantry was making similar progress against the enemy at Girmont. Between the 157th and the 179th Regiments the 180th Infantry was engaged in the battle for Epinal.

The Battle of Epinal

The 180th Regiment, 45th Division, had been given the mission of attacking the town of Epinal. Epinal is the hub of a large network of communications, roads, and military defenses and is divided by the Moselle River, which flows between sharply cut and steep banks. For a month prior to 20 September the Germans had been strengthening the surrounding forts at Epinal, and for the last five days they had had French civilians digging trenches. Three battalions of infantry, reinforced by artillery, mortars, and antiaircraft guns, defended the town. All approaches were heavily mined and booby-trapped and were supported by strong roadblocks covered by machine gun and automatic rifle fire city streets and the banks of the river in the vicinity of the

town were mined; two railroad over-passes had been destroyed. FFI and civilian reports stated that all bridges in Epinal were blown, with the exception of one large bridge in the center of the city and a smaller one to the south.

On 20 September the 180th Infantry regrouped southwest of Epinal and prepared to assault the town. The attack on Epinal was planned so that the 2nd Battalion would approach from the left flank near the village of Golbey and the 3rd Battalion from the right. During the afternoon of 21 September, the 3rd Battalion encountered heavy enemy automatic fire while clearing road blocks, mines, and wire entanglements along the main approaches about a mile west of the town. Tanks of the 191st Tank Battalion in support of the 3rd Battalion leveled road blocks and succeeded in taking high ground overlooking Epinal. The 2nd Battalion, moving to the north of the 3rd, encountered similar defenses. The battalions held their positions during the night through heavy concentrations of enemy artillery, tank, and rocket fire. The activity of the Germans began to change from continued withdrawal to defense in positions.

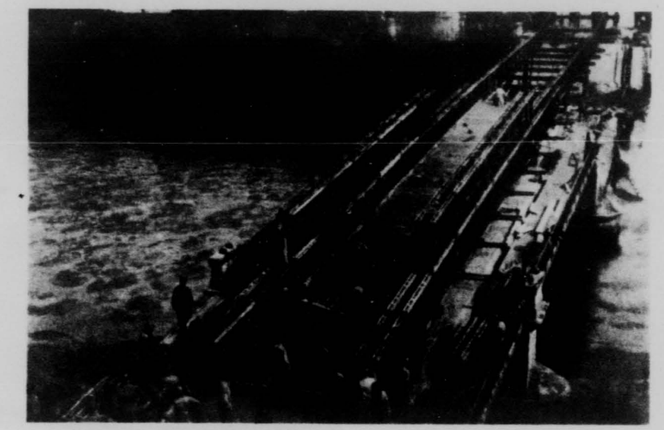
On 22 September the 180th Infantry was engaged in clearing the west side of the town. Its patrols clashed with the enemy, and the fighting took place from house to house. Many mines and roadblocks were cleared. Tanks of the 191st Tank Battalion assisted in the attack and were placed in firing position along the west bank of the river.

The infantrymen meanwhile continued to fight their way toward the river. At 1320 hours the 180th Infantry reported to the 45th Division that "we are sending a couple of girls (FFI agents) back to your place. They have a lot of information. They report there are two bridges in town . . . . The girls came over one of them. They have a map of the town that shows all the road blocks and all the mined areas. They report enemy dug in for 500 yards . . . . That has been substantiated. We can see them and are firing on them . . . . They report the place is heavily mined and there are considerable numbers of roadblocks all around the town. There is about half a regiment on both the east and west sides of the town; a majority on the east side of the town in the woods . . . ."

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED



At 1500 hours on 22 September the Germans appeared to be pulling out of Epinal on roads leading eastward. American artillery started shelling traffic observed moving along these escape routes. An hour later, shortly after 1600, the report was confirmed that the Germans had pulled out most of their troops west of the river, and had blown the last two remaining bridges. The Americans pushed forward to ascertain what holding forces remained. That night the engineers made a reconnaissance for a crossing, but enemy small arms and mortar fire from both sides of the river interfered with the operation. Although all bridges had been destroyed, a Bailey bridge could be rapidly constructed at one of two possible sites in town.

On 23 September, in the face of heavy small arms, mortar, and tank fire that continued all day, the 180th forced three river crossings. The first was made in the vicinity of Golbey, just north of Epinal. Here all three rifle companies of the 2nd Battalion crossed the river and advanced toward Jeuxey, killing and capturing many of the enemy. South of the first crossing other troops of the 3rd Battalion forded the river in spite of heavy tank fire directed against them from the eastern bank and moved into houses and buildings to clear out isolated groups of the enemy. All crossings were covered by machine guns placed on the west bank and riflemen were installed in buildings close to the river to pin down the enemy.

After the first wave of infantry had crossed, the engineers put a ferry into operation to transport additional troops and supplies and to evacuate the wounded. Three attempts to put in a foot-bridge were unsuccessful because of the swiftness of the current. Finally on the night of 23-24 September two foot-bridges were established over the debris of blown highway bridges. By 0500 hours on 24 September, Company F, 36th Engineers, had moved up a bridge train and started construction of a 140-foot, Class 40, Bailey bridge. The bridge was completed by 1600 hours; and tanks, tank destroyers, and vehicles crossed to support the infantry's advance.

While the construction of the Bailey bridge was in progress, the 1st Battalion, 180th Infantry, crossed at first light of 24 September and passed through elements of the 2nd Battalion to press the attack to

the northeast. It reached Jeuxey and there gained control of the heights overlooking the river. On 25 September the 2nd Battalion moved north toward the expanding zone of the 157th Infantry on the division left flank and patrol contact was made; the 3rd Battalion completed clearing

140 FT. BAILEY BRIDGE ACROSS THE MOSELLE AT EPINAL

". . . The bridge was completed by 1600 hours; and tanks, tank destroyers, and vehicles crossed to support the infantry's advance . . ."

Epinal of isolated Germans and secured all the prominent heights southeast of the town, making union with the 179th Infantry on the division right.

The capture of Epinal gave Seventh Army the control of the key communications center in the Vosges. In the town were found 15 locomotives and a large number of cars. Dumps of ammunition, maps, and military supplies were also taken. Epinal was important to the Seventh Army as a base for future operations in the Vosges. General Truscott personally congratulated the 180th Infantry Regiment on the success of its operation.

THIS PAGE IS UNCLASSIFIED

The 3rd Division Crosses at Rupt

On the right flank of VI Corps, the 3rd Division encountered the most difficult terrain and determined opposition and was last to cross the Moselle. The routes from the division positions at Faucogney and Melisey to the river at Rupt-sur-Moselle and Le Thillot led through heavily forested hill masses peculiarly adapted to defensive and delaying operations. The slowness of the French advance exposed the division right flank and retarded its progress. In the 3rd Division zone the approach to the Moselle, and not the river itself, was the chief obstacle.

At daybreak on 20 September the 3rd Division resumed the attack northeast toward the Moselle with the 7th and 30th Regimental Combat Teams moving generally northeast from the Melisey-Faucogney line. The 15th Infantry remained in reserve with one battalion in the process of being relieved by the 1st French Infantry Division on the right. By midmorning the advance had slowed down, having met stubborn resistance from the heights at the village of Melay, three and a half miles north of Melisey. This mountain village lay near the French zone and on the right flank of the Americans, in fact almost in their rear, necessitating its capture before the advance could continue. The enemy was operating largely in isolated groups and was taking full advantage of the thick woods and mountains. Roadblocks were constructed of logs and covered by 30 or 40 infantrymen armed with machine pistols, machine guns, and antitank guns. By 1130 hours the 3rd Battalion, 30th Infantry, was at the outskirts of Melay but was stopped by cross fire of machine guns and rifles. In order to envelop Melay from the north, the 1st Battalion, 30th Infantry, moved out from Faucogney and attacked southeast to secure La Mer, a hamlet one mile north of Melay. Continuous rains made the poor mountain roads impassable for armor. During the afternoon artillery shelled enemy defenses heavily and in return received devastating flanking fire from heights north of Melisey, still not yet cleared by the French. At dark the village was taken after a bitter house-to-house fight.

Throughout 21 September the 30th Infantry continued to attack. The width of the front, coupled with extensive enemy defenses,

precluded anything but minor advances. The 3rd Battalion was receiving fire from three sides, and its progress was measured in yards. Small groups of enemy infantry and automatic weapons teams infiltrated into forward positions by crawling and creeping through the woods. At a

MOVING TO THE FRONT

". . . The attack was launched north and west of the main road out of Faucogney . . ."

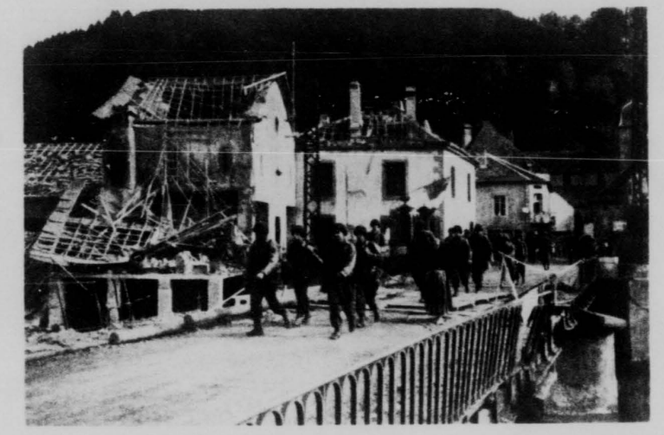
given signal they attacked, and such attacks increased in size and tempo until they came about every half hour. Enemy artillery was particularly active, and tree bursts caused many casualties.

The 7th Infantry, on the division left flank, launched its attack north and west of the main road out of Faucogney and advanced steadily until it occupied the forest heights overlooking the Moselle (Hill 753, altitude in meters). At 1800 hours on 21 September the 3rd Battalion in the lead reported, "The fighting in the woods is pretty tough. The undergrowth makes movement difficult. The battalion has been having quite a fire fight." The woods were dense and the troops advanced

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED



by crawling toward unseen enemy positions. The Germans occupied prepared positions in the clearings and semi-open places, generally well camouflaged with branches and small logs. In the early morning of 23 September the 7th Infantry succeeded in driving back the Germans and in reaching the Moselle across from Rupt.

The 30th Infantry, after the fight at Melay, attacked toward the Moselle along the southeastern side of the highway from Faucogney to Rupt. During 22 September intense and violent fighting took place along the route, especially in the vicinity of the village of Evouhey, where the enemy was well dug in. Roads in the regimental zone were blocked and mined. The next day the 3rd Battalion was ordered to turn east and seize high ground overlooking Le Thillot on the Moselle, while the 1st Battalion continued to clear Evouhey, and the 2nd Battalion attacked Esmoulieres, a German strongpoint south of Evouhey and in the division rear right flank.

By the end of 23 September the 7th Infantry was in position to cross the river and attack the town of Rupt. About midnight one platoon of Company B found a bridge intact. The troops crossed the river and began to fight off enemy attempts to blow the bridge, which had already been prepared with 19 boxes of TNT. Other companies quickly followed, and by 0500 hours an extensive bridgehead had been firmly established. By midmorning all units of the regiment had crossed the Moselle. On 24 September the 1st Battalion cleared Rupt of snipers and occupied the heights to the east of town (Hill 867, altitude in meters). Other elements of the regiment advanced south from the bridgehead to reach La Roche against considerable resistance and north to seize a second bridge at Maxonchamp.

The 30th Infantry attack, meanwhile had made slow progress against increasing resistance, in bad weather, with poor visibility, and over rugged terrain. On 25 September 30th Infantry troops were two miles south of Rupt, held up by German defenses at Le Chene, on the road running along the west bank of the Moselle. The highway was almost completely blocked with heavily-mined fallen trees. The enemy from well defended positions met the 30th Infantry's advance with fire

from small arms, mortars, self-propelled, and 20 mm flak guns. The Americans were forced to make their way forward through pouring rain and dense woods. Le Chene was taken at 1620 hours, and the regimental objectives on the hill overlooking Le Thillot were secured before noon.

A BRIDGE INTACT

". . . The troops crossed the river and began to fight off enemy attempts to blow the bridge, which had already been prepared with 19 boxes of TNT . . ."

26 September. The area was then turned over to the French, and the 30th Infantry was ordered to move by motor to Remiremont, in the 36th Division sector, and to cross to the east bank.

The Drive Into The Vosges Passes

In the last week of September VI Corps had successfully crossed the Moselle. The east bank within the Seventh Army zone was being cleared of the enemy; and bridges at Epinal, Arches, Jarmenil,

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

Eloyes, Remiremont, Maxonchamp, and Rupt were in operation. Prisoners stated that initial orders had been to withdraw to Germany but that these were later changed and units were ordered to hold for 20 days, because fortifications near the German border would not be finished until then. The Germans had fought stubbornly to hold the Moselle line and now continued to contest every foot of the advance toward the passes through the Vosges.

The 36th Division, with three regiments abreast, advanced from its Eloyes-Remiremont bridgehead northeast toward its objective, St. Die. The 141st Infantry on the right was to clear a reported enemy concentration at St. Ame, four miles east of Remiremont. The advance over muddy secondary roads was painfully slow; only ¼ ton vehicles could be used to bring up supplies and ammunition and evacuate the wounded. On the night of 24-25 September, following a concentrated artillery barrage, the 1st Battalion of the 141st Infantry penetrated the town, and captured the German commander, his staff, and 185 men. The next day this area was taken over by the 3rd Division; and the 141st Regiment moved to support the 143rd, attacking toward Bruyeres.

On 28 September General Truscott ordered the 36th Division to advance on Bruyeres, the 141st Infantry operating to the right of the Jarmenil-Bruyeres road, the 143rd moving up the ridge to the left of the road while the 142nd was to finish clearing the Forest of Fossard and the village of Tendon on the division right flank.

The 142nd had already reached the vicinity of Tendon on 24 September. Strong enemy forces were found prepared to defend the town and the Hill 827 (altitude in meters) southeast of it; an estimated 400 to 600 Germans were in the area. The only supply route across the hill mass between Eloyes and Tendon was a single, little-used, cart trail, which was impassable for armor or heavy vehicles. On 25 September the regiment maneuvered to close in on Tendon but met a severe enemy counterattack. Artillery support was called for to forestall a possible breakthrough, and companies from the division reserve were quickly brought up to the threatened area. Fighting continued throughout the day. At nightfall the Americans withdrew to more favorable defensive

positions in order to close the line, which was being constantly threatened by German infiltration.

The 142nd Infantry, now reinforced, reorganized on a three-battalion front and put its supply line in order. The new arrangements proved effective. The 2nd Battalion entered Tendon against stiff resistance on the 27th. The enemy, attempting to escape in the direction of Le Tholy, launched a sudden attack on the 1st Battalion center, east of Tendon, and laid down a heavy artillery barrage on the 3rd Battalion. Desperate fighting followed, as depleted companies attempted to maintain an established line in the thickly-wooded hills. The enemy hid out in pockets or infiltrated back into areas previously cleared. By 29 September the heights east of Tendon (Hill 827) were finally cleared of the enemy at a cost of 80 casualties in the 1st Battalion. The 142nd Regiment had thus secured its objective and continued fighting to hold it. The next day the enemy, supported by heavy artillery and mortar fire, again vainly counterattacked the hill positions. The fighting during the week had been costly. Many companies, weakened by casualties and fatigue, were down to platoon strength.

On the left flank of the 36th Division the 143rd Infantry, supported by elements of the 141st, drove northeast along the Bruyeres highway. The Germans threw in many artillery concentrations and in this open terrain employed mines extensively. By the end of the month the village of Docelles, Xamontarupt, Faucompierre, and St. Jean du Marche had been taken and a continuous line established with the 179th Infantry, 45th Division, on the left and the 142nd Infantry on the right. The 36th Division was still over four miles from Bruyeres but in favorable position for the attack.

The route of the 45th Division to Rambervillers from Epinal led through more open country, and its advance met with greater success. Striking from their crossing areas, the regimental combat teams followed Highway 46 from Epinal, and cleared the road net and villages east of the 36th Division area. Action consisted chiefly of reducing roadblocks and of the occupation of towns.

The 157th Infantry attacked northeast from its position near Thaon, driving the enemy from Domevre, and then swung to the

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE.IS UNCLASSIFIED

southeast to within striking distance of Sercoeur. On 26 September the regiment occupied Sercoeur and pressed again on to the northeast to take Padoux, five miles from Rambervillers. A drizzling rain hampered operations on the 27th; but the advance continued, and on the following day troops of the regiment were within a mile of the objective. Patrols entered Rambervillers on the morning of 29 September but were withdrawn in the afternoon while French armor from the XV Corps attacked from the northwest. At dawn on 30 September after a 15 minute artillery barrage, the 157th entered Rambervillers and met only spasmodic resistance. The town was secured, and by nightfall defensive positions were set up.

Advancing from Epinal the 180th Infantry, in the 45th Division center, likewise made good progress over favorable terrain. The Germans were withdrawing and no serious opposition was encountered. By 26 September the regiment had reached Girecourt, and Gugnecourt about seven miles south of Rambervillers. The 2nd Battalion took Girecourt with little opposition and pushed on to secure Destord, two miles north. Company E cleared Gugnecourt, taking 64 prisoners; but a counterattack during the night forced it to withdraw. The next day the Americans attacked again and retook the town.

The 1st Battalion, 180th Regiment, attacked from Destord northeast toward Ste. Helene. The 2nd Battalion turned southeast from Destord toward Pierrepont, which was captured in the afternoon of 28 September. On 28 September the 180th Infantry took 213 prisoners, the largest total during any single day of the month. The regiment was then ordered to assist the 179th Infantry in the attack on Grandvillers, a major road junction on the highways connecting Epinal and Rambervillers with Bruyeres.

The 179th Infantry, operating south of the 180th and in conjunction with the 36th Division on the right, had advanced through the forest of Epinal, east of the city, by 25 September. Progress was impeded by increasingly thick woods, mine fields, and booby-trapped roadblocks. However, after three days fighting, the regiment had taken several villages on the approaches to Grandvillers and had advanced through Memenil. Nevertheless, resistance became increasingly severe

as the infantry approached Grandvillers. During the afternoon of 28 September the 2nd Battalion, with tanks in support, assaulted Vimenil and reached the outskirts of Grandvillers by nightfall. The following day the advance was checked by heavy enemy fire from along the Grandvillers road. However, the advance of the 180th Infantry from Pierrepont into the enemy's rear forced him to divide his forces.

On 30 September the 1st Battalion, 179th Infantry, attacked the enemy in Grandvillers and engaged in fierce street fighting. By 0745 hours the western end of the town was secured and 30 prisoners taken. Throughout the day the battalion continued the attack, and by 1925 hours Grandvillers had been completely occupied.

The 3rd Division, after securing the bridgehead at Rupt, released to the French the southern sector of its front at Le Thillot and on 27 September shifted its attack north to the highway from Remiremont through Le Tholy to Gerardmer. To attack directly from Rupt to Gerardmer was not feasible, as the high wooded hills of the Forest of Longegoutte presented a major natural obstacle. On 27 September the 30th Infantry was motorized and moved north to Remiremont where the 15th Infantry, released from reserve, was relieving the 141st Infantry, 36th Division, in the St. Ame area. The 7th Infantry continued to expand the Rupt bridgehead, sending the 3rd Battalion north along the Moselle toward Remiremont. The 1st Battalion, 7th Infantry, pushed northeast through the forest toward the village of Thiefosse, while the 2nd Battalion continued up the Moselle to capture Ferdrupt and there await relief by the French II Corps.

On the high ground just east of the Moselle the Germans now occupied a definite defense line. Their withdrawals ceased; and they held on tenaciously, counterattacking frequently. The enemy resorted to jungle tactics on the 3rd Division front in the heavily-wooded terrain between the Moselle and Moselotte Rivers, and frequently infiltrated behind the American lines to ambush supply trains. It was planned to establish well-organized positions northeast of St. Ame, covering the road to Le Tholy. In this area the Germans, bringing up reinforcements, resisted fiercely, counterattacking and infiltrating to retake lost ground

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

At 0600 hours on 26 September, the 15th Infantry attacked northeast from St. Ame. The 1st Battalion seized a bridge east of the town before the Germans could detonate the prepared charges and destroy it. The next day the 2nd and 3rd Battalions pushed northeast on the road to Le Tholy. Enemy groups, by-passed in the wooded areas on either side of the highway, continually threatened supply lines and slowed down the advance. The point of the advance withstood two counterattacks during the hours of darkness, while other enemy groups infiltrated in the rear near St. Ame. The striking force of the regiment was reduced by the necessity of defending the flanks in strength. By nightfall of 28 September the infantry had reached positions two miles north of St. Ame.

On 29 September the 30th Infantry joined the 15th in the attack. German infantry, supported by tanks, held strong defensive positions in front of Le Tholy. They were ordered to hold to the end, and it was reported that this order was enforced by SS troops at their rear. Heavy small arms, mortar, and artillery fire limited the American advance to yards. At the close of the month the 3rd Division was still attacking a strong enemy line before Le Tholy, meanwhile blocking to the south towards Le Thillot on the French front.

CHAPTER XIV

Problems of Rapid Advance

SPEED of the inland penetration of DRAGOON forces created logistical problems which strained all services of supply. Assault convoys were loaded out on the premise of a hard, slow campaign with priority given to infantry combat and supporting units. On the third day of the campaign supply chiefs initiated plans for changes in shipping priorities to assist in exploitation of weakened German resistance. Phasing of units to arrive after D plus 20 was adjusted to bring in services to support a war of rapid movement. General Patch received from General Devers the assurance of all possible aid in pushing the advance and, as the initial augmentation of forces to accomplish this aim, the promise of an additional six Quartermaster truck companies.

Transportation and Supply for the Beachhead

On D-Day the unloading of assault forces and supplies adhered to the planned schedule, but by D plus 1 it was evident that a shortage of gasoline and rations was imminent. In anticipation of heavy fighting on or near the beaches, a layer of ammunition had been placed over the cargo; and it was necessary to lay this aside to expedite the beaching of gasoline and rations. The VI Corps revised priority on unloading, to which schedule the Army Commander subscribed when beach control passed on 17 August from sub-task force commanders to Beach Control Groups. DUKW's and LCT's were diverted to unloading gasoline from an MT ship which had been brought in with 50,000 gallons aboard.

Diversion of efforts to meet the demand of rapidly moving troops disrupted planning schedules. Huge piles of mixed ammunition accumulated on the beaches, as labor was largely employed in with-

drawing specific items needed at the time. A shortage of chains and hoisting frames handicapped unloading, and men were unable to handle the cargo as rapidly as desired. In order to land a maximum number of combat troops with vehicles and equipment in the first days of the invasion, the numbers of supporting service troops had been held to a minimum. It also proved difficult to obtain civilian labor. The problem of labor was partially solved by the creation of pools of workers by the Assistant Chief of Staff, G-5.

Aggregate tonnage discharge over the beaches met expectations during the initial phase, although there was some delay in beaching D-Day supplies. In the period from 0800 15 August to 1800 17 August, 119,060 personnel, 15,717 vehicles, and 6,232 tons of cargo had been moved from ship to shore. In the succeeding 24 hours cargo discharge was boosted to 7,113 tons along with 4,929 vehicles and 17,032 personnel. The problem was not one of beach capacity at this time, but of a selective demand occasioned by operations which had departed from the plan.

Tasks confronting the Army supply services in beach operations were reflected within the assault divisions, which faced the added difficulties of rapid extension of supply lines and tactical demands for transport of combat troops. The 3rd Division encountered a D-Day delay in the beaching and unloading of supply craft which, together with the allocation of ammunition, had created a critical gasoline shortage by D plus 1. Reasons for the narrowness of the margin by which the assault divisions were able to support their operations were given by the 3rd Division G-4: 1) insufficient gasoline had been loaded under Army maintenance plan; 2) unloading of supplies for the first three days fell far behind schedule; 3) the Beach Group was slowed down by the necessity of unloading and handling thousands of tons of ammunition which were not expended for the operation; and 4) the distances from the beach supply points to the combat units became far greater than that on which the assault scale transportation was based.

Four days after landing, forward elements had pushed past Sisteron, more than 100 miles from the beaches. Gasoline continued to be the most critical item of supply. Gasoline dumps captured at Draguignan, Le Muy, and later at Digne were exploited to continue the

advance and overcome shortages within the units. The three American divisions were consuming approximately 100,000 gallons a day, when the Army Quartermaster reported on 21 August that only 11,000 gallons remained in the three beach dumps. Immediately the Seventh Army gave top priority to the unloading of gasoline and rations and tightened fuel consumption restrictions, which had been instituted at the outset.

Division supply problems increased during the Battle of Montelimar, when a growing demand for ammunition was added to the over-burdened transportation facilities. There was no shortage of ammunition in the beach dumps; but the haul was a round trip of more than 400 miles from the divisions, each of which had given over trucks, along with the VI Corps, to motorize Task Force Butler.

Expenditures of ammunition had been exceedingly light during the pursuit. As the 36th Division, however, with Task Force Butler then under its command, assembled for the Battle of Montelimar, it was without sufficient transportation to complete the assembly, provide adequate rations and motor fuel, and re-supply the artillery units with ammunition. Organic transport of the division, augmented by the advanced issue of trucks phased in for loss replacements, was further supplemented by VI Corps, which created a 30-truck ammunition train from the 3rd Division. Twenty trucks were to haul 105mm howitzer and ten trucks 155mm howitzer ammunition in preparation for concentrated fire on enemy convoys in the Rhone Valley. The combined effort enabled the artillery units to fire an average of 96.2 rounds of 105 mm howitzer ammunition per weapon per day in a two-day period with an average of 99 weapons in action. This was a peak expenditure in the first month and a half of the campaign of southern France. With an average of 30 pieces firing daily, the 155mm howitzer units sent 34 rounds per weapon into the target area, while a battalion of 155mm guns, with eight pieces in action, averaged 37.4 rounds per gun. By comparison, during the 17 days of action in August, average expenditures per weapon per day were 30 rounds of 105mm howitzer, eight rounds of 155mm howitzer, and 6.5 rounds of 155mm gun.

The initial crisis on artillery ammunition had been overcome, but the shortage of gasoline persisted in forward areas. To alleviate the

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

situation Seventh Army employed trucks of newly arriving units to convoy motor fuel forward. On 25 August VI Corps estimated gasoline requirements as: 36th Division, 50,000 gallons; 45th Division, 35,000 gallons; 3rd Division, 25,000 gallons, and Corps troops, 10,000 gallons. Daily journals of the units reflected temporary periods in which the gasoline supply was exhausted. At Digne 26,000 gallons of gasoline, captured on 24 August, relieved shortages for the 36th Division when it was closing in at Montelimar.

Rail Rehabilitation

Forward elements of the Army were more than 200 miles inland and spread from Montelimar eastward through Grenoble to Briancon on the Franco-Italian border, when completion of a rail link between Frejus and St. Maximin enabled the Army Quartermaster to open the initial forward supply dump on 24 August. Gasoline, rations, and ammunition were stocked at St. Maximin a town on Highway 7 between Brignoles and Aix.

Completion of the Frejus-St. Maximin rail line opened the first section of the Army supply route, to be used until the ports of Marseille and Toulon could be put into operation. This was the first step in the rail rehabilitation program expedited to meet requirements of lengthening supply lines. By D plus 15 the Seventh Army held Lyon. Arrival of units and material for reconstruction of the French rail network had been phased, however, on the premise that Lyon would be a D plus 150 objective. While reconstruction and operation of the railroads was a responsibility of the Military Railway Service, late phasing required Army engineers to perform most of the initial repair, especially that of bridging.

Major scale rail operation had not been contemplated, until a rail terminal such as Marseille had been captured. Railroad troops had been phased in sufficient quantity only for minor rehabilitation. Two railway battalions had been scheduled to arrive coincident with the capture of the ports, with the Railway Grand Division arriving in echelons. Tactical developments prompted the Transportation Section

on D plus 2 to request the shipment of rail units advanced by approximately 30 days.

So precipitous was the German retreat that time and means were denied for destruction of railway trackage as completely as the enemy had effected in Italy, and air reconnaissance indicated available rolling stock exceeded early estimates. Allied air attacks on enemy trains had created blocks, one of which was 18 miles long and made up of such heavy equipment that it was necessary to lay a new track for the by-pass. Principle enemy damage consisted of bridge demolitions.

Initial rail operations were on a 15-mile, narrow-gauge line between St. Tropez and Cogolin, with five wagons and a Diesel passenger unit on D plus 2. Service from Frejus to St. Maximin, completed on D plus 9 utilized a main coastal line, exploitation of which had been planned. Three hundred tons of gasoline, rations, and ammunition were loaded on the first train for St. Maximin, while a similar train departed the same day for Draguignan, on a branch line from Les Arcs. By 27 August track repair permitted the shift of loading from Frejus to St. Raphael, where a better equipped station was available, and daily tonnage was lifted to 900 tons.

First extended westward to Aix-en-Provence, rails were then rehabilitated northward to Meyrargues on the Durance River, where the first major break was encountered. Freight was moved by a combination of rail and motor shuttling, with rail transportation from Camel Beach to Meyrargues and truck transportation for about 70 miles from there to Sisteron, the southern terminal of a small capacity line to Grenoble which had been rehabilitated by VI Corps. The gradient of the Sisteron-Grenoble line limited its capacity to 125 tons per train with five to nine trains operating daily. Initial operation beginning 24 August of a portion of the line, from St. Julien just north of Aspres to Grenoble, was an enterprise of the 45th Division which enabled it to free a substantial number of trucks for the 370 mile roundtrip to the Army dump at St. Maximin. In five days the division moved 2,100 tons of freight and 4,700 personnel over its line.

As troops of the Seventh Army advanced they secured additional rolling stock and locomotives. By 3 September the Army had

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

available 1,300 wagons and 100 engines, although many were in poor condition. Coal was limited and of low quality. A week later rail service was extended from Grenoble via Chambery and Culoz to Amberieu, where track demolitions had tied up more than 250 German wagons along with 6,000 tons of coal. Failure of the enemy to destroy a power plant permitted the Chambery-Culoz portion of the line to be operated with electric power.

The task of rail reconstruction fell to the Army engineers who, on 30 August, were confronted with tactical operations of the D plus 60 anticipated phase, while bridge equipment was arriving for the D plus 14 phase. Improvisation was necessary as heavy fixed and floating equipment was not scheduled to arrive in quantity until D plus 25. Except for portable military bridging construction, materials were obtained from local sources. Stocks of structural material steel were moved to bridge sites from Marseille before complete surrender of the German garrison in that city, while facilities of steel fabricating shops in Grenoble, machine shops in Ornans, lumber mills in the Jura and Doubs areas, oxygen and acetylene from a manufacturer in Chalon, and wire rope from a concern in Bourg en Bresse were utilized.

On D plus 19 supplies were delivered to forward areas both by direct truck shipment from the beaches to Grenoble, and by the rail shuttle from Camel Beach to Meyrargues, truck to Sisteron, and rail to Grenoble. For operation of the rail lines, rail units were being brought in 15 to 30 days earlier than originally planned. By D plus 45 railroads were in operation up the Rhone Valley, from Marseille via Lyon, Dijon, Dole, and Besancon to Vesoul and St. Loup. By 2 October freight was moving by train at the rate of 550 tons 500 miles a day, the equivalent of 275,000 ton-miles per day.

During this period bridges were built partly by innovation and partly by exploitation of material at hand. The 343rd Engineer (General Service) Regiment reconstructed a bridge near Aix-en-Provence by using the 104-foot traversing base of a 270mm German gun to span two 51-foot gaps. Emplacing the gun carriage as if it were a Bailey bridge after repair of the masonry piers, the 343rd Regiment

completed the task in four days; and the first train crossed on 29 August. A new application of the Bailey bridge was employed by the same unit to restore a span over the Durance River near Meyrargues. To close the gap of 170 feet a pier was constructed at midpoint and a Bailey deck panel was projected. Although it had not been used previously over so long a clear span, calculation proved that such a support would bear the required load capacity. The bridge was reopened at 1200 hours, 17 September.

Next in priority to restoration of the Grenoble route was reestablishment of the doubletrack line from Marseille to Lyon; the greatest difficulties were three bridge demolitions over the Durance River at Avignon, over the Drome at Livron, and over the Isere north of Valence. The 343rd Engineer Regiment completed the construction of the bridges in 15, four, and nine days, respectively, the last by 20 September, ahead of the target date of 1 October set by Sixth Army Group. The early completion of the bridges insured supply by rail ahead of expectations.

Concurrently with the completion of the route to Lyon, other units were engaged in repairs northward. Seventeen days after the area had been cleared, the 540th Engineer Regiment opened the last blocks on a through route from Marseille to Bourg with the spanning of the Ain River at two points near Pont d'Ain. Farther north the 344th Engineer (General Service) Regiment, by 5 October had constructed the longest continuous railroad bridge in the northward push, a 460-foot Bailey deck bridge over the Doubs River at Dole.

Opening of rail lines enabled the Seventh Army supply services to set up advance dumps and to reduce distances combat units were required to transport supplies. On 25 August the Quartermaster had opened a dump at Sisteron, using rail and truck shuttle; but truck transportation was falling behind commitments and the railhead at St. Maximin was low on gasoline. Opportune arrival of two coasters with 6,000,000 gallons and operation of bulk gasoline installations at Camel Beach alleviated the shortage on 28 August. The problem became one of transportation. The lack of a bridge at Meyargues denied a continuous

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

rail line to Genoble and motor transport was overtaxed by the demands. The situation was becoming more critical daily.

Transportation and Supply Above Montelimar

To meet the urgent demand for transportation of troops for the pursuit without withdrawing trucks from the long supply haul, VI Corps organized on 3 September three provisional truck companies from organic units. Corps artillery units contributed a share of the vehicles, as did the 36th and 45th Divisions, which organized the provisional groups. On 9 September corps artillery warned that resupply of ammunition was a serious problem because of the distances involved and one which could not be met against organized resistance, which induced General Truscott to radio General Patch: "Present advance is resulting in excessive distances for units to travel to get ammunition. One division has a round trip haul of over 400 miles to ammunition dump at Bourgoin. Urgently request that advance ammunition dump be set up at least as far north as Lons le Saunier." Army agreed to open an ammunition supply point by 13 September in the vicinity of Mouchard, which was about 30 miles north of Lons Le Saunier. Its establishment did not solve the problem for the corps, however; and on 14 September a battalion of corps artillery was made inactive so that its transportation could be used for ammunition hauls.

As elements had prepared for the push to capture Lyon, the distances between combat units and sources of supply became even more extended. Transportation for the rapid inland movement had engulfed the fuel, trucks, and driving personnel provided by planners who had not looked forward to such a pattern of progress. At the beginning of September VI Corps computed distances as great as 213 miles between the 45th Division Command Post at Amberieu and the Army's gasoline and ration railhead and ammunition supply point at St. Maximin; 165 miles from the 3rd Division Command Post at Voiron; and 158 miles from the 36th Division Command Post at Bonchert. Advance of Army dumps permitted by extension of railroads provided relief from time to

time during September, but the continuing progress of the three infantry divisions resulted in recurring lengthy gaps.

Opening of dumps stocked with food, fuel, and ammunition on 2 September at Bourgoin, La Tour de Pin, and Montelimar reduced distances to divisional Command Posts to 24, 30 and 83 miles for the 3rd, 45th, and 36th Divisions, respectively; but on 10 September, with Army food and fuel dumps at Amberieu, the divisions were at Devecer, Baume les Dames, and Velefaux, 118, 128, and 135 miles beyond, and Corps headquarters, at Besancon, was 111 miles distant. Establishment of an ammunition supply point on 12 September at Arbois whittled the transportation haul 72, 60, and 75 miles for the three divisions which were then at Mollans, Cubrial, and Luxeuil. Three days later the source of ammunition was the closest it had been since departure of the divisions from the beaches: three miles for the 36th Division, four and one half miles for the 3rd Division, and eight miles for the 45th Division. But the haul for gasoline and rations was not as short, for the dumps at Poligny were on 21 September, 87 miles from the 3rd Division at Faugogney, 95 miles from the 45th Division at Bains Les Bains, and 102 miles from the 36th Division at Hadol.

Development and extension of rail lines coincident with the increasingly static tactical situation began to ease the acute shortage in transportation near the end of September with the rail link operative from Marseille through Lyon and Dijon to Vesoul operative by 28 September. It was not until later that rail lines were able to carry the approximately 5,000 tons of supplies and equipment needed daily by the Army. During the period from D-Day there had not been an adequate number of transportation units available to the Army, which in turn had imposed additional burdens on lower echelons. Although rail shipments had met minimum daily requirements, extended supply lines had resulted in dangerously low levels with reserves almost depleted.

Approach of winter weather necessitated a speeding up of delivery of clothing items to forward dumps. To accomplish this, B-24 aircraft of the XII Tactical Command flew 50 tons of Quartermaster Class II supplies into Dole and Dijon; but all articles except 30,000 pairs of socks were found to be Class X (unserviceable) upon arrival. On 28

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

September VI Corps reported, however, that sufficient winter underwear was en route by rail to equip each man with one set and that issue of the third blanket per man had commenced. But the Army's plan for supply of winter clothing to the troops was jeopardized by unloading at Marseille falling behind schedule. Furthermore, the Army's supply services were confronted with assumption of supply responsibility for the XV Corps, which had a strength of 50,000.

Although distances involved were not as great as with the American divisions, the French Army, for whose supply the Seventh Army was responsible initially, likewise was encountering difficulties. On 10 September the French Army was receiving three trains each day for shipments to Aix and Avignon, from which supplies were trucked to Mison and Laragne for trans-shipment by rail to the French dumps. Seventh Army established ammunition supply points to support the French on 21 August at Fuget Ville, on 24 August at La Bauque, on 9 September at La Baumette, and on 11 September at Lons le Saunier, through which an average of 300 tons daily was being handled. Truckheads for Quartermaster Class I and III supplies (Rations and Fuel) were opened 1 September at Avignon and 6 September at Mison and St. Andre la Gaz, the latter stocking only rations. The railhead had been opened 24 August at La Barque. An engineer supply truckhead was established 1 September at Avignon.

Although Seventh Army was relieved 15 September of operational control and direction of the First French Army upon assumption of command by the Sixth Army Group, supply responsibility continued to 26 September, when base section began its functions in the supply plan for support of both armies. Technical and physical difficulties combined, however, to prevent complete separation until late in October. At the end of September the French Army described its supply situation as critical with heavy engagements on its entire front, which prompted the Seventh Army Chief of Staff to authorize aid through an equitable allocation of available supplies between the two armies. Receipts by rail were falling below daily requirements and for a short period, pending the time train schedules could be rearranged, the Seventh Army allocated the French 65,000 gallons of gasoline, 53,000

rations, and 279 tons of ammunition daily. Inadequacy of supply prevented the Seventh Army from granting the total requests of the French in certain types of ammunition, principally light artillery, mortar, light machine gun, and automatic rifle shells.

Signal Operations

Fast moving warfare provides abundant problems for all forces involved, but the strain on communications is perhaps the most noticeable. Just prior to D-Day, two radio tests were held by all headquarters ships at specific times during the day and night to determine the efficiency of the radio installations and what, if any, frequencies were unworkable. Every radio set that went into Operation DRAGOON was tuned to a proper frequency, and fortunately conditions were ideal for radio communication during the early part of the campaign.

Landing with the assault units were the signal supply personnel of the 207th Signal Depot Company and the 177th Signal Repair Company. Also with the initial assault groups were the signal operations personnel of the 71st, 72nd, and 74th Signal Special Companies to handle communications for the three division beach groups. One detachment of the depot and repair companies kept each of the three American assault divisions supplied with signal equipment during the early stages of the operation and maintained these functions on the beaches throughout August.

From the outset of the campaign a shortage of transportation made signal operations difficult. Gaps existing between the echelons of command widened, rendering the usual modes of high speed construction of wire, Rapid Pole Line, and Multi-Air-Line so inadequate that they were not used. Instead, wire construction personnel of two battalions rehabilitated 1,716 miles of Postes, Telegraphes, and Telephones open wire lines and placed 152 miles of Spiral-4 on messenger. From the beaches north to Brignoles the lines were badly damaged, requiring almost complete rehabilitation; but northward from that point the open wire was in fair condition and breaks were mended quickly. Delay in arrival of signal units with special purpose vehicles for wire construction

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

handicapped development of wire communications during the early, fast-moving phase of the campaign.

The month of September brought the Seventh Army its severest communication difficulties, but limited Seventh Army signal personnel surmounted these problems and established several records in doing so. Great distances between echelons of the Seventh Army and its subordinate units made wire communication a tremendous problem until the end of September, when base section and army group personnel began to take over some of the many rear lines and the tactical advance began to slow down. The long distances involved in the first half of the month were ideal for radio, since the sky wave could be used almost exclusively to all commands. On 6 September the shortest radio circuit was 88 miles — to Army B; on 14 September, it was 43 miles — also to Army B; and on 20 September, just after the Command Post moved to Vesoul, it had narrowed down to 15 miles — to VI Corps. Even at Vesoul, however, the majority of radio circuits covered distances of more than 100 miles.

The speed of the advance and the growth of communications is forcibly portrayed by the Seventh Army Line Route Maps, Communications, Traffic, Circuit and Radio Diagrams for D-Day to 1 October when the Command Post was established at Epinal and the situation became semi-stabilized.

Highway Repairs

Concurrently with the strenuous program of bridge reconstructions to reopen rail lines, maintenance of other means of transportation was essential. Roads in southern France form a dense and comprehensive network, generally well constructed, but weakened by bridges, some of which were limited by civilian authorities to loads of five tons or less. From tactical and supply standpoints, the most important of the highways were the Route Napoleon, Highway 85, extending from the beaches to Caste Dane, Digne, Sisteron, Gap, and Grenoble and Highway 7 which followed the left bank of the Rhone, passing through Montelimar, Valence, and Lyon. Although the enemy's rapid

withdrawal denied him the opportunity for demolitions as extensive as could be accomplished in a slower retreat, conversely the problem of highway maintenance by the Engineer Corps increased with mileages involved.

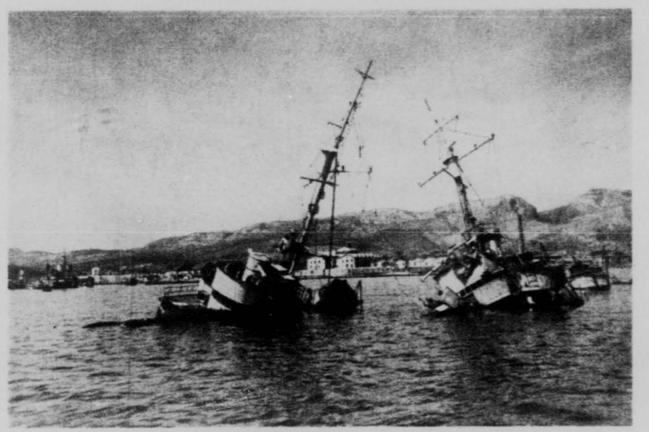
Corps and divisional engineers accomplished repairs to highways and bridges, although there was little new road construction. Engineer units were largely concerned with mine sweeping, removal of roadblocks, clearing of debris, and filling of bomb, shell, and demolition holes.

Prior to the end of September, however, the Army engineers had constructed 88 highway bridges, of which 19 were considered major work projects, in addition to the erection of 28 Bailey bridges. Construction of timber bridges to replace Bailey bridges was expedited because of the shortage of tactical bridging material.

Ports and Bases

Steps to shift from beach to port operations followed the fall of Toulon and Marseille on 26 August, 27 days ahead of the planning time-table used by Army engineers. It had been contemplated that Toulon would be the first sizeable port to fall to Allied control, but the sweep of the French made both ports available at approximately the same time. A choice of ports to rehabilitate was presented.

Marseille, largest port of France and of the Mediterranean, was the southern terminus of the Rhone-Saone corridor, with rail connections inland through Grenoble and Lyon, and canal connections with the Rhone. Its artificial harbor was secure in all weather, and its facilities, with 85,000 feet of quays and 98 projecting wharves largely served by rail, could in peacetime handle 20,000 deadweight long tons daily. Toulon, 31 miles southeast, had a peacetime capacity of less than that of Marseille; and preliminary reconnaissance disclosed that, contrary to expectations, it had been damaged more severely than Marseille. German demolition units had destroyed the naval base and other installations, while shore bombardment by Allied naval vessels and bombing by the Air Corps had increased the magnitude of destruction. It was



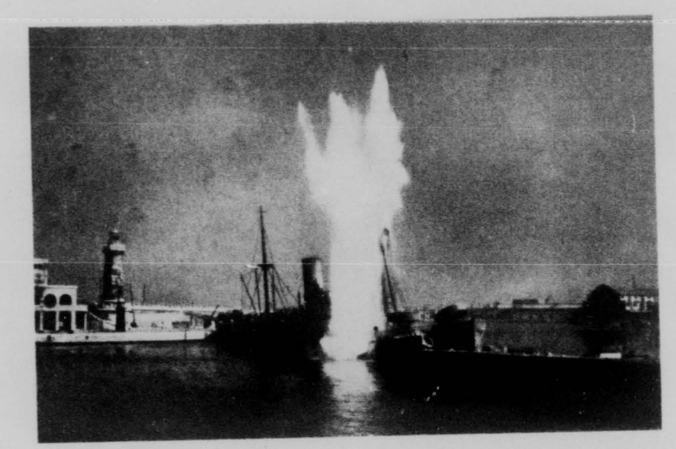
THIS PAGE IS UNCLASSIFIED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

estimated that upon development Toulon would have a capacity of but ten berths for Liberty ships; Marseille, strategically better located, could be developed to berth eight Liberties by 8 September and ten by 25 September along with accomodations for a total of 25 other ships.



SCUTTLED SHIPS IN TOULON HARBOR

"... It was estimated that upon development, Toulon would have a capacity of but ten berths . . ."

Three days after the fall of the two ports, the Chief of Staff conferred with Engineer officers, Naval officers, and Coastal Base Section officers on reconstruction of the facilities. Decision was made to concentrate all salvage personnel and equipment available on repair of the port of Marseille under supervision of Army engineers, while Seabees would develop Toulon harbor under a plan of operation to be furnished by the Continental Base Section. On the same day the Naval Commander of the Western Naval Task Force stated in a dispatch to General Patch that "Experience in this theatre has shown that beach

maintenance after mid-September is inadequate and that it is essential to have protected ports available to insure adequate facilities to supply advancing armies", and outlined his plan to accomplish that goal.

Joint operations of Army and Naval forces immediately began

BLASTING A PASSAGE-WAY THROUGH TO MARSEILLES HARBOR

"... The northern end of the port was completely blocked by sunken ships . . ."

rehabilitation of the great port which had been damaged extensively. The northern end of the port was completely blocked by sunken ships, while anchorage in the southern end was suitable for restoration as a lighter landing. The inner harbor was sown with magnetic and acoustic mines and all types of explosives were buried in the port area. Jetties, quays, berth spaces, and cranes were mined and booby-trapped after blasting had wrecked them. Thousands of mines lay in the channel beyond the outer mole, undetonated by the enemy for lack of time.

Representatives of base section coordinated with Army in rehabilitation of the port, as had been the procedure since the early

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

THIS PAGE IS UNCLASSIFIED

stages after the landing to facilitate the transfer of line of communication functions to base. The original plan was for base section to assume control of the first major port ten days after its fall from the Seventh Army. Three days after the fall of the ports, responsibilities were

HARBOR OF MARSEILLE

"... jetties, quays, berth spaces, and cranes were mined and booby trapped after blasting had wrecked them ..."

divided with the engineer base section assuming the duties of engineer work in Marseille and Toulon except for port repair, which was a function of the Seventh Army Engineer. Eight engineer units available for port work were divided. The Army Engineer representative prepared to direct unloading of the three port repair shiploads of personnel and materiel, which had been loaded out to land on call after D plus 10, and subsequent rehabilitation of the port.

Construction was immediately started on the "hards" for landing LCTs and ramps for landing lighters and DUKWs. Unloading

by lighters proceeded in the southern end of the port while clearing of the inner port was in progress. The task of clearing Marseille harbor was assigned to the 1051st Port Construction and Repair Group, which had performed the same mission at Naples. The 36th Engineer Combat Regiment had the job of "delousing" the inner harbor and reconstruction of the berths to be ready by the time the Navy cleared a passage through the blockships. That part of the Marseille area known as Avant Port Joliette was declared by the Navy to be clear of mines as of 1800 hours, 3 September; and port ships began to discharge there.

Bassins, Marechal, Petain, and Mirabeau were opened 15 September, at which time two and one-half Liberty berths alongside Mole H, and nine holding berths in Avant Port Sud were already available. Bassins, President Wilson, and de Pinede were to be cleared by 18 September, on which day Liberty ships were unloading at ten dock berths and operations were three days ahead of the original Navy estimates. Five days later Admiral Hewitt radioed General Patch that on or about 25 September the port of Marseille would have a discharge capacity of 12,500 tons daily.

By 25 September when Camel Beach was closed, the Navy reported that there were 16 alongside and 23 offshore berths in use at Marseille, three at Port de Bouc, and seven and one-half at Toulon. There had been unloaded at Marseille 50,569 personnel, 6,711 vehicles, 99,171 tons of dry cargo, and 10,000 barrels. At Toulon aggregate discharges to 25 September were 5,085 personnel, 2,628 vehicles, 24,252 tons of dry cargo, and 76,130 barrels. Through Port de Bouc there had been discharged 30,795 tons of dry cargo and 239,600 barrels. The Navy reported that on D plus 40 there had been brought ashore over beach and through ports 324,069 personnel, 68,419 vehicles, 490,237 tons of dry cargo, and 325,730 barrels of wet cargo in support of DRAGOON.

On 8 September transfer of control from Army to Base Section of line of communication functions was arranged, relieving all engineer regiments of Army except one battalion from each of the 36th and 40th Engineer Combat Regiments as soon as the three ships of the port repair convoy had been unloaded. Headquarters of Coastal Base Section had opened 1 September in Marseille with limited functions, and Base

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS DECLASSIFIED IAW EO 13526

THIS PAGE IS UNCLASSIFIED

Section Engineers assumed responsibility for normal engineer duties in the base zone on 10 September. The transfer of Army responsibility to the Base Section was completed by D plus 26. Near Shore Control Headquarters at Naples terminated its activities, and the ports operated directly with SOS NATOUSA and other lines of communication agencies. By the end of the month the Continental Base Section opened at Dijon, and Delta Base Section replaced it at Marseille.

Summary of the Period

As the period of rapid advance came to a close, at the end of September, combat troops were faced with new conditions. Continuous pursuit over long distances changed to difficult and plodding progress, and the weather became cold and rainy. The old stone houses, the mountains ,the rain reminded many a veteran of the previous winter in Italy. The "champagne" war was over. Troops of the services of supply had given full support to the advance, working under difficult conditions brought about by plans which lagged far behind operations.

On 27 September General Truscott issued a memorandum to all officers and men of the VI Corps, summarizing the accomplishments of Operation DRAGOON:

> Seven weeks ago the VI Corps landed on the beaches in Southern France. In these seven weeks, ably supported by Naval and Air Forces and by our French Allies and French Forces of the Interior, you have cleared the enemy beach defenses, you have encircled and isolated the ports of Toulon and Marseille, and facilitated their capture by our French Allies. You have cleared the Durance Valley, encircling and destroying a large portion of the German Nineteenth Army; you have opened the Rhone River Valley. You have pursued the fleeing remnants of the once proud German Army almost to the border of Germany itself. Your pursuit has covered almost 500 miles from the beaches. It has involved hard fighting against a desperate enemy. It has involved two major river crossings. You have encountered and overcome every obstacle that German ingenuity could devise. You have been required, with less than organic transportation, to move yourself and your weapons over hundreds of miles, distances that few would have considered possible.
>
> Your operations have been of great assistance to the Allied Armies in Northern France and a vital factor in clearing Southwestern, Southern, and Eastern France of enemy forces.
>
> This campaign will stand as a monument to the training, fighting spirit, boldness, aggressiveness, determination, and willingness to undergo hardship, of the American soldier and the leadership of American officers of all ranks. To all officers and men I express my sincere appreciation for your hard and untiring efforts and my deep admiration for your accomplishments during this period.
>
> Our task is not yet done. Hard fighting remains. The enemy, reorganized and reinforced, is on the border of his own country. Difficult and rugged terrain confronts us. Rain, cold, and snow will increase the difficulty of our operation. However, I face the future with complete confidence that, surmounting every obstacle and taking every objective in your accustomed manner, you will destroy the enemy before you, and will be a vital factor in the final defeat of the enemies of our country.
